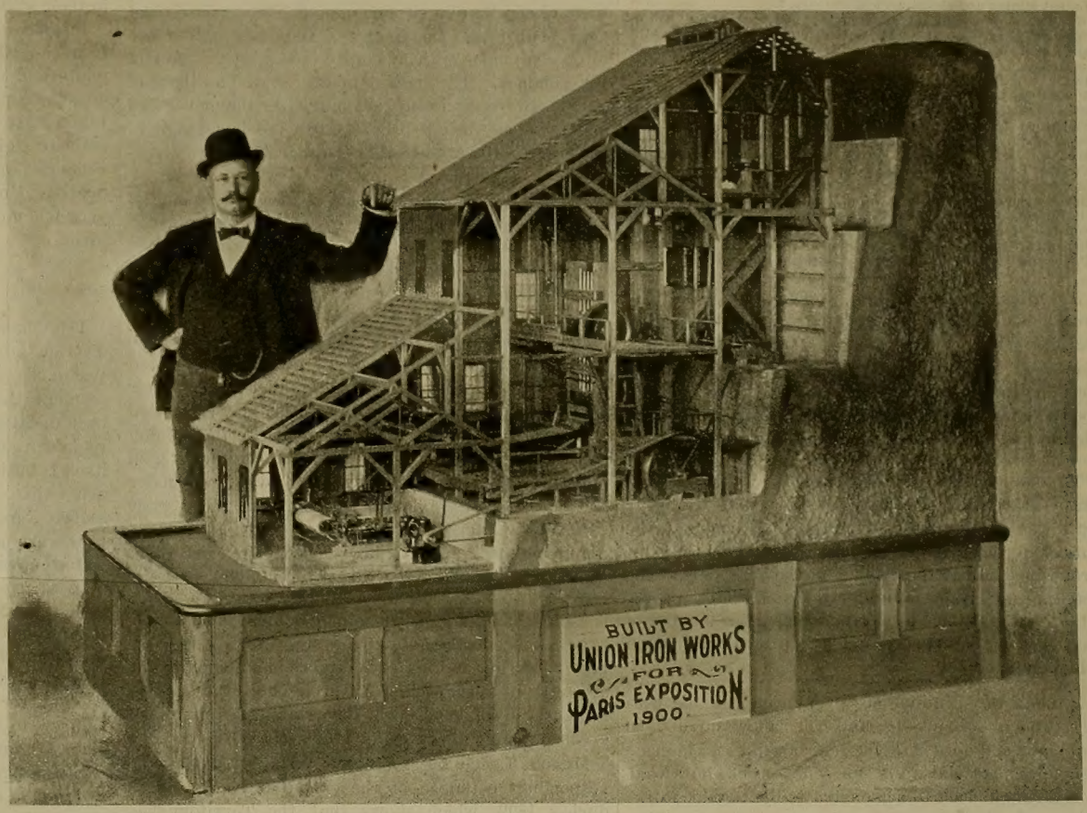
MINING AND SCIENTIFIC PRESS.



AND PACIFIC ELECTRICAL REVIEW.

No. 2061.—VOLUME LXXX. Number 1. SAN FRANCISCO, SATURDAY, JANUARY 6, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

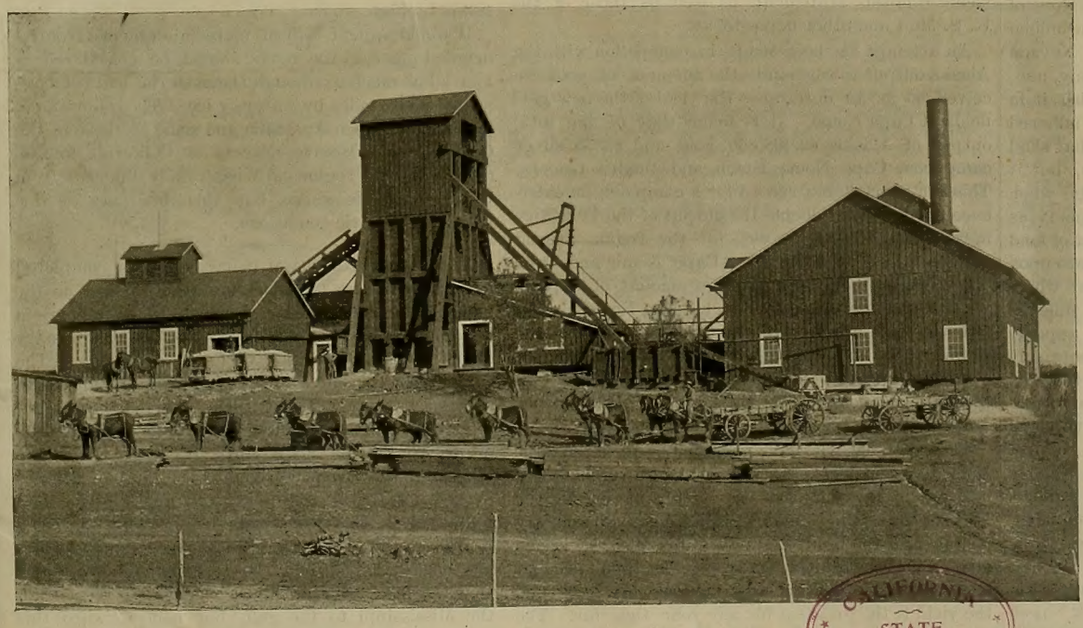
A California Contribution.

The world will be on view at Paris next year, and American miners will have prominent part in the great show. It will be occasion for good advertising, and everywhere prominent manufacturers of mining machinery are preparing special exhibits.

Some of those have already been noticed. One of marked value is herewith illustrated. It is an exact model of a 5-stamp gold mill built on a one-tenth scale by the Union Iron Works of San Francisco, Cal. It is complete throughout, and works as readily and thoroughly as any first-class 5-stamp mill, of which it is a miniature copy. It has its ore crusher, grizzly, stamps, plates, concentrator for sulphurets, electric motor to furnish power, etc., complete, and when set up at the French capital, and given its regular supply of gold ore, will work steadily, showing the entire mode of operation, and will, doubtless, be constantly surrounded by groups of curious visitors, interested to see how the dull-looking lumps of rock have the yellow gold extracted therefrom, and how cleverly the little model does the work. The miniature mill depicted herewith cost about $3000; the background is of "staff," a plaster mixture, designed to represent the side of the canyon in which the mill is supposed to be. To show its diminutiveness, the figure of a man is purposely introduced. Were that portion of the picture omitted, there would be no way to judge of the relative size of the machine, and the picture would look like that of a usual-sized 5-stamp mill; but, upon comparing it with the figure of Mr. W. G. Dodd, the superintendent of the mining department of the Union Iron Works, it will readily be noted how small the model is, though perfect in every working detail. The accompanying picture is copyrighted by the Union Iron Works, San Francisco, Cal.

Model—One-Tenth Size—of Five-Stamp Mill, Sent by Union Iron Works, San Francisco, to Paris Exposition.*

The Mines of Salt Spring Valley, Cal.



Between Bear mountain and Gopher Ridge, in Calaveras county, Cal., lies Salt Spring valley. Through this trough-like depression extends a gold belt reaching a distance of fifteen miles from the vicinity of Copperopolis northwestward to Valley Spring. Bear mountain and Gopher Ridge are composed largely of diabase of various types, from a crystalline granular, dark green rock to one of light color and aphanitic texture.

The dyke rocks are fine grained, light colored and of greatly varying size.

The gold-bearing quartz of the district is associated with these dykes, usually constituting a portion of the dyke.

The Royal consolidated mines at Hodson are at present the most extensively developed property in the valley. The accompanying illustration is that of the hoist building and head frame at that mine.

An electric plant is about to be installed at La Grange for the purpose of furnishing power to the Royal mines and incidentally to others of that vicinity, and a 120-stamp mill is also in contemplation at this mine.

The Royal Consolidated Mines, Salt Spring Valley, Calaveras County, Cal.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Model—One-Tenth Size—of Five-Stamp Mill, Sent by Union Iron Works, San Francisco, to Paris Exposition; The Royal Consolidated Mines, Salt Spring Valley, Calaveras County, Cal., 1. Section at Leadville, Colo., Showing Laccolite; Ore Deposit above Laccolite Sheet, 5. Portion of Cyanide Plant at El Progresso, Lower California; Clinched Sheet Steel Pipe, 6. Latest Mining and Metallurgical Patents, 7.

EDITORIAL.—A California Contribution; The Mines of Salt Spring Spring Valley, Cal., 1. Coast Gold Yield in '99; What is Alluvial? Decision of the Federal Court at Los Angeles, Cal.; Miscellaneous, 2.

MINING SUMMARY.—13-14-15.

LATEST MARKET REPORTS.—17.

MISCELLANEOUS.—Concentrates, 3. The Cripple Creek Gold Fields, 4. Laccolites and Their Relation to Ore Deposits, 5. Some Seemly Rhymes; Clinched Sheet Steel Pipes; El Progresso Mines of Lower California; Factory for Electrical Seasoning of Timber; Experiment with Superheated Water, 6. Latest Mining and Metallurgical Patents; The Occurrence of Tin; Proposed Government for Nome Beach, 7. A Decision Affecting Oil Lands; Of Interest to Steam Freighters, 8. Index to Volume LXXIX, 9-10-11-12. Industrial Notes; Personal; Commercial Paragraphs; Recently Declared Mining Dividends; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 16.

AN interminable litigation appears to be in progress over mining property at Butte, Mont. The complex geological conditions due to faulting and displacement, which has occurred since the ore deposits were formed, and the American apex law are responsible for most of the trouble, which is accentuated by the large financial interests at stake.

THROUGHOUT the mining regions of the United States statistical compilations show that the year 1899 was an increasingly prosperous one, and the outlook for a greater success during 1900 is more promising than at the opening of the year 1899. The spontaneous attack from all sides upon wildcat propositions has had the effect of decreasing the number of that class of enterprises and has placed many upon a higher plane.

WHEN a prospector finds a very rich lead, he usually at once becomes fearful, will allow no one to develop it and does little himself, but fixes a big price on his prospect and waits for some one to buy what he is afraid himself to demonstrate by actual work. It is rarely that those possessing capital are willing to take so greatly exaggerated a chance, even on a rich specimen mine, for it is a well known fact, as proven by experience, that "specimen" mines in general are very irregular producers, and they have deluded more people into unprofitable investments, perhaps, than any other kind of mining property.

WE are indebted to the courtesy of Judge Ross of the Federal Court at Los Angeles, Cal., for the official text of his recent decision in the case of the Nevada Sierra Oil Company vs. the Home Oil Company, and, as usual in such important decisions, publish it in full. The Court, in deciding this case, has adhered strictly to the letter of the law in defining what shall constitute a valid discovery and relocation, but it places the prospector at a great disadvantage when the "indications" are such on adjoining property as to determine to a certainty that a given tract of land is mineral bearing, though no mineral appears upon the surface. Geological conditions may exist which will determine a certain tract of land to be mineral bearing, though no surface indications may appear. This decision, though relating to oil lands, affects any mineral deposit which does not outcrop on the surface, such as the ancient river channels of California, which course for miles hundreds of feet beneath a lava cap. Many of the mines of Leadville, Colo., and of Lawrence county, South Dakota, are of similar character in this respect. The subject is an important one, and, in view of the rapidly growing oil industry of California and other Western States, it is necessary that congressional action be taken to simplify the existing uncertainty as to the rights of the prospector, to whom the mining industry owes much of its existence. At the convention of the California Miners' Association, held in October last in San Francisco, Cal., a resolution was presented having a bearing upon this important matter, but which, unfortunately, was voted down without discussion.

Some Coast Gold Yields in 1899.

While it is yet too soon to expect a complete account of the value and distribution of bullion product for 1899, Frank A. Leach, Superintendent, and Chas. G. Yale, Statistician, of the U. S. Mint in San Francisco, have prepared a preliminary statement, based on receipts at the U. S. Mint and other bullion depositories on this coast. This shows that California produced in 1899 gold to the amount of $15,000,000, and silver $636,000. During the summer of 1899 numbers of quartz mills throughout the mountain counties of California were closed down for some months through lack of water. There were more of them closed than in the summer of 1898, as the second year of drouth found many of the reservoirs of the ditch companies entirely empty in the latter part of the summer. The gravel mines, as well as those of quartz, were seriously incommoded, the river-bed miners alone being benefited by the low stage of water. In Kern and other southern counties, however, no dependence is placed on water power for mills, all being equipped with steam power plants, and there has been an increase of gold product in that direction. A number of new mining enterprises have been started, and these, with the increase from the South, have evidently more than made up for the deficiency caused by the lack of water in the older mining regions. Several gold-dredging outfits have been profitably working during the past year, and more are being built. These have added their share to the increased product. The figures quoted should be of great encouragement to the mining community, since they show that the California gold mines are more than "holding their own," even under the most adverse climatic disadvantages. If they can show an increase of product of three-quarters of a million during an extended period of drouth, there should be an increase of two or three millions for the coming year now that an abundant supply of water is assured for all kinds of mining. Meantime advantage has been taken of the low stage of water to repair, enlarge and extend ditches, and repair and strengthen reservoirs all throughout the mining regions, all of which will have influence on an increased supply of water for mines in 1900.

Messrs. Leach and Yale have also prepared a corresponding estimate of the output of Alaska mines during 1899, which shows that the Territory has doubled its gold product over the previous year. The record for 1899 is gold $4,917,821 and silver $82,680, as compared with an output of gold of $2,517,121 and of silver $49,152 in 1898. This shows an increase for the year of $2,400,700 in gold and $33,728 silver, or a total of $2,434,428. It should be stated that the returns at the U. S. Assay Office at Seattle are included in this statement, as well as those of the U. S. Mint and other depositories.

An attempt has been made in connection with the Alaska output to segregate the amounts of gold received so as to determine the yield of the new gold fields at Cape Nome. It is found that of the total output of Alaska $2,408,830 gold and $3935 silver came from Cape Nome beach and tundra placers. This is a remarkable record for a camp only in existence one year—to double the output of the Territory in that time. It argues well for the region around Norton sound, Golovin bay, Cape Nome and Cape York, where there is yet a large amount of unprospected and unworked territory. The Nome placers have in 1899 apparently practically equaled in gold produced the combined output of the quartz mines of southeastern Alaska and Unga island and of the placers of Manook, Circle City, Forty Mile and other Yukon river districts.

Those persons who have imagined because the Cape Nome excitement has for the present overshadowed interest in Dawson, that the latter camp, on the British side of the boundary, is not doing so well, are mistaken, if the figures supplied by Messrs. Leach and Yale of the Mint are correct. The gold product of the Klondike shows a large increase for 1899, and the yield is the greatest for any year thus far. The gold output for the year is $16,110,129 and the silver $114,617. In the year 1898 the gold yield was $11,038,478 and silver $80,498, so an increase of Klondike gold is shown of $5,071,651 and of silver $34,119, the total increase being $5,105,770. The Klondike annual gold yield thus for the first time eclipses that of California, by about a million dollars.

Of course it has been impossible to make any estimate of the amount of gold mined either in Alaska or the Klondike, which has been retained at the mines. Only those amounts which have been received at the mints, Government assay offices, refineries and other depositories of bullion, have been considered in these estimates. The amounts retained to come out next season will be counted on next year's output when received at the mints, etc. The banks, commercial, trading and transportation companies, which do a large business in Alaska and Northwest Territory finally deposit their gold at the assay offices, refineries and mints, so these amounts are accounted for in their statements.

In 1898, out of a total gold product of $11,038,478 from the Klondike $414,295 was taken to Eastern mints and assay offices and not deposited on this coast. A proportionate amount has doubtless been taken East this year, which may be added to the estimates given. When all the statements of mints, refineries, assay offices, etc., are received from all over the United States, the figures of output of the year will no doubt be somewhat larger than those given.

What is Alluvial?

The miners of Western Australia, in Kalgoorlie district, are litigating over the meaning of the word "alluvial," as applied to mining. In the suit now pending the vein, or reef as it is called there, has been disintegrated and the debris of reef and wall rocks spread over the top of a low ridge and the vein itself is buried in the detritus; and as no croppings are visible, the exact location of the vein is not known. As the owners of the vein in adjacent territory were not working the ground covered by the detritus of the reef, it was located by placer miners as alluvial ground. The reef owners objected on the ground that it was not alluvial, that it was simply a fragmentary mass of material broken down by disintegration of the reef, but not washed, and that it was practically in place and therefore was, in fact, reef matter and not alluvial, and consequently not subject to location as placer. The placer miners claimed that all fragmentary material resulting from the disintegration of a vein was essentially alluvial, and, when enjoined by the court from working the ground in dispute, disregarded the injunction and were arrested.

The debris covering the low ridges of Western Australia is often from 3 to 15 feet in depth and often contains large quantities of gold. The disintegration has been effected by a wide range of temperature and infrequent heavy rains, resembling cloudbursts when they do occur. These agencies are materially assisted by high winds.

It would appear that all material detached from its original place in the rocks should be considered as alluvial as much as though the material had been removed many miles by water or ice. The alluvial deposits of Western Australia and some of those in the Colorado and Mojave deserts of California and in other very dry regions are essentially different from those found elsewhere, but this difference is due wholly to climatic conditions.

THE Chicago drainage canal has been completed and is in use, the gates having been opened on the morning of the 2nd inst. It has been seven years in building and has cost nearly $33,000,000. Its primary object is the disposition of Chicago sewage. The canal from an engineering standpoint is not only a success, but a novelty, as it has diverted the waters of Lake Michigan, which flow through it, from their natural outlet to the Atlantic ocean by way of the lakes and St. Lawrence river to the Gulf of Mexico by way of the Mississippi river and intermediate tributaries. The work was begun Sept. 3, 1892. For years the greater part of the sewage of Chicago has been pumped into the Desplaines valley, down which it flowed to the Illinois river, and thence via the Mississippi to the gulf, but henceforward this sewage will pass through the canal, being diluted by a large volume of water from Lake Michigan.

Concentrates.

THE British Klondike yielded more gold than California in 1899.

A HIGH speed in hoisting cannot be safely attained in inclined shafts without the use of guides, as skips are likely to jump the track.

TUNNELS run to develop mines should always, when possible, be run on the vein; only a great advantage in gaining depth should give preference to a crosscut tunnel.

THERE is no positive or satisfactory way of determining whether an ore is amenable to cyanide treatment without making a complete series of experimental tests.

TO OBTAIN the extralateral right—that is to follow the vein downward on its dip beyond the side lines of a claim located since May 10, 1872—the end lines of the claim must be parallel.

AN adverse claim must be filed with the register and receiver of the land office where the application for patent was filed, or with the register and receiver of the land office in which the land is situated at the time of filing the adverse claim.

THE Civil Code of California defines hydraulic mining as follows: "Hydraulic mining within the meaning of this title is mining by means of the application of water under pressure through a nozzle against a natural bank." The process was invented in 1852.

A STEAM-PIPE and water-pipe cement that will set under water is made of 2 pounds ground Paris white, 5 pound ground litharge, ½ pound fine yellow ochre, ½ ounce hemp cut up small. Mix well with linseed oil to the consistence of putty and use immediately.

SECTION 6 of the California State mining law of March, 1897, provided that all locations of quartz or placer formations or deposits, hereafter made, which do not conform to the requirements of this act, in so far as the same are respectively applicable thereto, shall be void.

THE watt is the unit by which electrical energy is measured. It is equal to the current of one ampere flowing at a pressure of one volt, i. e., a current of ten amperes with a pressure of 100 volts represents 1000 watts. A horse power is understood to be the equivalent of 746 watts.

LIQUID chlorine has been given practical test in chlorination works in California and elsewhere, but preference is yet shown the bleaching powder (used exclusively in barrel chlorination), not through conservatism, but because the latter seems to give the greater degree of satisfaction.

AN oil-soaked leather belt should have fuller's earth sifted on it, and after a short time scrape off with a sharp-edged piece of wood. Oil is injurious to rubber belts, but if a rubber belt slips on account of dust or dryness a very little boiled linseed oil applied on the pulley side of the belt will help.

TO ATTAIN the highest success in cyaniding ores the operator must be a proficient chemist and assayer or must employ others possessing these qualifications. Without knowledge of the chemistry of the process and methodical sampling the results may be satisfactory but it is "guess work" at best.

MORE attention is being given the concentration of ores at the present time than ever before, and as the necessity for this method of treatment becomes more generally understood the practise is likely to increase. Its employment affords a means of successfully working some mines that by any other method could only be worked at a loss.

THE assay ton is 29,166 grammes. It is obtained by dividing 14,000,000 (the number of Troy grains in one short ton avoirdupois) by 480 (the number of grains in 1 ounce Troy), so that 2000 pounds is to 1 A. T. as 1 ounce Troy is to 1 milligramme. If 1 A. T. of ore assays 1 milligramme of gold the ton contains 1 ounce Troy.

ON a mining claim located any time during 1899 the locator has until Dec. 31, 1900, to do the requisite $100 assessment work, and in California until Feb. 1, 1901, to make necessary record thereof. In California proof of labor for assessment purposes on mining claims done during 1899 should be filed with the County Recorder prior to Feb. 1, 1900.

TO CONVERT Fahrenheit thermometer degrees into degrees of Centigrade, subtract 32, multiply the remainder by 5 and divide the product by 9. Centigrade is the scientific thermometer. Fahrenheit is used—just for the same reason that two buttons are sewed on the under side of a coat sleeve at the wrist—a strange survival of an old custom.

LARGE amounts of water have been economically and speedily handled by the use of large bailing tanks arranged in tandem. This method has been particularly successful in mines worked through shafts having a low angle of inclination. The skips upon arrival at the surface dump automatically. From 1500 to 2500 gallons per trip can be removed in this manner.

ANY individual has the same right to locate a mining claim at Cape Nome as at any other place in the United States. The same general mining law applies there as it does in every other State or Territory in the Union. No leases of the beaches have or can be made. Anybody can mine on the beaches where no claim is ahead of him, but no claims can be legally staked out on the beaches, as the slopes below high water mark are held in trust by the Government for the future State. In the meantime, they may be mined by the first men to get onto them, who will hold their ground solely by actual possession.

WHERE A locates a claim in June, '99, and fails to erect monuments or posts at the corners, as required by the Federal statutes, his is not a valid location, and B, coming later, may locate a claim including a whole or part of the ground originally claimed by A; and in the event of contest A could not establish his right to the claim.

WHERE a shaft is inclined at an angle of 80° to 85° from the horizon and skips are employed, the skip should be provided with wheels which run on a track as in inclines of less inclination, and it should also have guides, as there is not only danger of overturning the skip in the shaft, but a greater danger of its leaving the track. In fact, it would be hazardous to run without guides.

WORK done upon a newly made mining location, prior to the first day of January next succeeding the date of such location, will not be credited to the annual assessment of $100 required by the Federal statutes, which specify that the period within which the work required to be done annually on all unpatented mineral claims shall commence on the first day of January succeeding the date of location of such claim.

WHILE no well equipped establishment objects to giving estimates or making bids on a large contract for mining machinery, yet it is not always possible to get the whole plant from one concern. Where the party inviting bids can make manifest intent and ability to order and pay for the stated requirements, and can be trusted to treat the figures furnished as confidential, there need be no insuperable difficulty in getting competitive bids on "a big job."

LONG tunnels to develop mining property are only advisable when the surface workings of the vein appear to justify such expensive development. The owner of a claim is rarely justified in driving a long crosscut tunnel before considerable development has been accomplished from the surface. Many tunnels run upon insufficient surface development have failed to find the vein at all in depth; or, if found, it is often disappointing in character and value.

IN treating ore or concentrates the best practise is the practise that pays best, and when more money can be made by getting 85 per cent of the assay value than by more elaborate and costly processes resulting in securing 94 per cent the former is certainly more satisfactory from a financial point of view. The practically scientific spirit is to work toward the end that the 94 per cent may ultimately be secured at the same cost that the 85 per cent is now realized.

THERE is nothing in the Federal mining law which prevents any locator or any set of locators from appropriating as many locations on the same lode as they may be able to find independent discoveries upon which to base them, but no location may exceed the statutory limit as to length and width. No one location of placer ground for one person shall exceed twenty acres, and no association shall take more than 160 acres in a single claim, but as many separate claims may be taken as the locators desire.

WHERE the workings of two mines are adjacent, but not connected, and the workings of one, being lower than the other, naturally drains the higher mine, it is the good fortune of the latter, and the owner of the higher property can not be held responsible; but the owner of a mine can not, when workings are connected, divert the natural flow of water from his mine into that of his neighbor by means of dams, bulkheads or other artificial devices. The laws of gravity only must influence the flow of mine waters.

UNITED STATES MINTS coined during the last fiscal year 18,254,707 silver dollars. The silver cost the Government an average of 90 cents an ounce. The aggregate number of silver dollars coined since 1878 is 482,622,376, and the dollars to be coined from the bullion remaining in the treasury will raise this total to nearly 600,000,000. This coinage will stop with exhaustion of the bullion now in the treasury, for there is no authority of law at present for purchase of any silver except such as may be necessary for small coinage.

CONCISELY, it may be considered that the force that has produced the mountain ranges on the earth is that of attraction exerted by the earth's kernel on its shell. The argument is: The central mass of the earth is in a highly heated state, and as it gradually loses heat by radiation, the kernel shrinks, thus attracting, breaking and crumpling its shell, and throwing up by these means the elevations called mountains. This is further considered manifest by observing the persistency and continuity of the lines along which this crushing force has acted. It is, of course, to be noted that in its processes Nature takes no note of what we call "Time."

RIVETS are described by the diameter and length in even eighths of an inch. The length of a rivet is determined by adding together the grip of the rivet, that is, the thickness of the plates or parts through which the rivet is to be driven, the length of metal required to form one head, and $\frac{3}{4}$ of an inch for each joint between the plates to allow for uneven surfaces which prevent closer contact. The length thus found may be increased by about 9% to allow for filling the rivet hole, which is usually $\frac{1}{16}$ inch larger than the rivet; thus the length of rivet required to join three half-inch plates would be $2\frac{7}{8}$ inches. For countersunk work add one-half of the diameter of the rivet for the head. The height of the head of a snap rivet should be about two-thirds of the diameter of the shank, and the diameter of the head should be from one and one-half to twice that of the shank.

ROASTING telluride ores presents peculiar difficulties, as it is a volatile metal, and is liable to carry off both gold and silver. The tellurides of gold and silver melt at a low temperature, and volatilize at a temperature only a little above their melting point. If the temperature be high during the first stages, globules of gold will be formed, and this coarse gold may escape attack in the subsequent cyanide or chlorination treatment. The particles of gold are liable to be enveloped in, or coated with, a film of oxide of tellurium, which, during the last stages of the operation, requires a high temperature for its removal. Hence, telluride ores must be subjected to a very gradual roast, low temperature during the first stages, with a gradual increase to nearly a white heat during the latter part of the last stage. With such indicated precaution the loss of gold or silver in roasting is reduced to the lowest minimum.

A REGULATION of the Mojave, Cal., mining district provides that within ninety days after date of location a shaft shall be sunk or tunnel run to a depth of not less than 10 feet from the apex of the vein. Failure to perform the designated work within the time specified subjects the claim to relocation. This provision of the district law was contested in the courts, and the decision of the Circuit Court of Appeals for the Southern District of California, recently rendered, sustains the local regulation, and says a mining district or a State may make regulations and enforce them. The Court considers that the $100 required by the United States as the minimum amount, and that local districts and States have the power to make such reasonable regulations as they may deem advisable, and that such work is in excess of the United States requirements and not to be considered as a part of the assessment work required by the Federal statutes. The right of a State to make such legislation has been universally recognized.

AS to the cheapest fuel for engines, at a recent meeting of mechanical engineers the report of a committee appointed to investigate the subject was read. These figures were given on an engine of about 50 H. P. capacity. Natural gas (engine), 12½ cubic feet consumed per horse power per hour, or 37,500 cubic feet for one year of 300 days, at 22½ cents per 1,000 cubic feet, or $7.43 cost per horse power per year. Illuminating gas (engine), 18 cubic feet consumed per horse power per hour, or 54,000 cubic feet consumed in 300 days at $1 per 1,000 cubic feet, or $54 cost per horse power per year. Gasoline (engine), ⅛-gallon consumed per horse power per hour, or 375 gallons consumed in 300 days, at 7 cents per gallon, or $26.25 cost per horse power per year. Coal, four pounds consumed per horse power per hour, or 14,400 pounds consumed in 300 days, or 7⅕ net tons, figuring at $4 a ton, this would indicate $28.80 cost per horse power per year. As to coal, a day was considered 12 hours, with gas and gasoline the figures are based on a day of 10 hours.

WHERE a number of miners hold a group of claims singly they may unite in the performance of the annual assessment where the work so performed is for the benefit of all the claims, as the running of a tunnel. In such work or improvement for the benefit of the several claims $100 worth of work or improvement must be made for each claim of the group. The several claims must be contiguous. In this regard the United States Supreme Court said: "It often happens that, for the development of a mine upon which several claims have been located, expenditures are required exceeding the value of a single claim, and yet without such expenditures the claim could not be successfully worked. In such cases it has always been the practise of the owners of the different locations to combine and work them as one general claim; and expenditures which may be necessary for all the claims may then be made on one claim. In other words, the law permits a general system to be adopted for adjoining claims, held in common, and in such case the expenditures required may be made or the labor performed upon any one of them."—Jackson vs. Roby, 109 U. S., 440.

GEORGE D. SHAW of Chicago is the fortunate possessor of the latest wonder in a mining appliance which will "revolutionize" the present system. By the use of Mr. S's apparatus it will be wholly unnecessary to do any prospecting or even preliminary development work. To California drift miners it will be particularly valuable, enabling them to dispense with expensive tunneling under the lava cap. This, of course, on the presumption that Mr. S. is stating the truth. He writes that he has an instrument that will "detect the presence of ore," and approximately indicate "the depth necessary to sink to reach it," and "the exact point to sink to catch the ore where it approaches nearest the surface." He doesn't even have to note outcroppings—just "catches" the ore as it unwarily approaches the surface. He begs us to "just think of the aimless digging done every year which can be avoided by its use." He states that "the world as yet is not apprised of its great value." He will sell a United States patent for $25,000—that is, all this nation—except California. That fortunate State he reserves for himself, so that it would seem useless for any one to attempt negotiations with Mr. S. for that State. It seems that Chicago millionaires are aware of the existence of this device and are liable any day to buy the exclusive right, so that any one who wants it should "snap it up at once."

The Cripple Creek Gold Fields.

NUMBER IV.—CONCLUDED.

Written by T. A. RICKARD, State Geologist of Colorado.

The mines of Cripple Creek have paid their own way from grass roots—that is to say, they have not grown up by the expenditure of working capital in development. Working muscle has made a 10-foot hole into a productive mine. There is, therefore, an instant contrast between the financial features of the industry when compared with the gold fields of the Transvaal or West Australia.

It may be objected that all mines are first made by the pick of the miner and are then enlarged into important enterprises by the investment of capital in machinery and development. Nevertheless the contrast above suggested is not a strained one, because it is a fact that the mines of Kalgoorlie and Johannesburg were merely tracts of land when they became the basis for large company flotations. The shafts were sunk afterwards by the companies organized in London, or elsewhere, and the ore was uncovered by workings which had no existence at the time of the first organization of the enterprise. Companies were brought out with a large subscribed capital, a portion of which was paid out in the purchase of the property and another portion was set aside as a working capital. It is rarely the case that a mine floated on the London market is able to pay the increased dividends necessitated by an increased capitalization without some preliminary development such as will permit of an enlarged output without exhausting the ore reserves. In the case of the deep level mines of the Rand the working capital is a princely sum, sufficient to sink a shaft a couple of thousand feet, or more, and erect a mill of 200 or 300 stamps. The finances of South African mining are a study apart and the result of conditions previously unknown in gold mining, although paralleled in the coal industry. It represents a development of modern practise, such as renders the digging for gold a steady business.

Even in districts which have not the extensive low-grade deposits of the Rand it is necessary to provide for a rainy day, and English capitalists are accustomed to the idea of furnishing a certain amount of money as a reserve fund to tide over the lean places in a mine's development The English practise of heavy capitalization has been censured often enough, but there is this to be said of the methods of London investors, that by subscribing an adequate working capital they often permit the mine manager to enlarge the capabilities of a property so as to enable it to hold up under its increased load and continue exploratory work during those intervals when the production does not meet the operating expenses.

The history of Cripple Creek records comparatively few abandonments, because the veins have proved so generally productive that their yield has sufficed to keep the work of development going, even if it did not meet all the expenses. As soon as a small mine becomes organized into a company it is listed on the stock exchanges of Denver and Colorado Springs as a "prospect," and when it becomes a regular producer it is promoted to the society of "mines," the two classes being kept distinct on the call lists of the exchanges.

A mine which does not pay goes through eras of greater or less activity, according as the owners of it can scrape together the money needed to continue the work. Idleness is possible because the mining regulations do not entail forfeiture on that account. The claim can be "patented." Labor conditions such as obtain in the English colonies are unknown in Colorado, and the continuous operation of a mine cannot therefore be enforced under the mining laws.

The leasing system is an important factor in Cripple Creek mining. Three or four years ago it was more prevalent. The owners of claims who were too poor to develop them or too timid, cut them up into several sub-divisions and leased them. The lessees might be working miners, who engaged the service of others under them, or the mine might be leased to outside parties, who hired workmen in the ordinary way. The period of the leases varied from six months to two years, and the royalties were 15% to 20% of the net returns—that is, the receipts from the mill or smelter after the costs of transport and treatment are deducted. The system served a good purpose, and many rich mines owe their beginning to the enterprise of a lessee.

The infrequent transfer of mines which has characterized Cripple Creek up to the present is due to the fact that the conditions for successful mining are esent to an unusual degree. In the first place, no o sinking was needed to reach the ore. Although ops were rare, and discovery was thus delayed, became evident that the tops of the ore-bearis could be reached by trenching. Ore was red at depths of from 10 to 30 feet. It was ipple Creek has always been a high-grade average yield for several years exceeded s per ton, and last year, notwithstanding for increase in the low-grade milling ore, it was fully two ounces. Therefore, even in the earliest period of development, the ore could meet the costs of transport to the smelters. But competing lines of railroad were soon pushed into the district, and facilities for cheap mining were obtained long before the gold field had reached a quarter of its present importance. This fact permitted poor men to work the mines, because it gave them a market for their ores. Muscle and energy were sufficient; capital was not needed to the extent known in less favored localities. Even to this day no single mine has a reduction plant of its own; it is not needed. As the camp grew the chlorination and cyanide mills erected in or near the district began to compete with the smelters, and prevented the latter from levying excessive rates of treatment; and, lastly, the demoralization of the silver market which occurred at the time of the closing of the Indian mints in 1893, and put a check on what was then the chief industry of Colorado, did at the same time aid Cripple Creek by diverting the energies of a very resourceful population to the development of the mines of its newly discovered gold field.

STATISTICS.—From the first beginnings in 1859 to the close of 1898 Colorado has produced:

Gold.....	9,512,242 ounces	$196,618,054
Silver.....	362,526,541 ounces	326,482,532
Lead.....	1,064,762 tons	87,131,457
Copper....	43,089 tons	10,742,167

The production for 1898 is estimated to have been:

Gold.....	1,138,584 ounces	$23,534,531
Silver.....	23,502,601 ounces	13,690,265
Lead.....	56,708 tons	4,117,043
Copper.....	5,435 tons	1,304,504

At the present time the mineral production of the State, inclusive of coal and iron, has a value of $55,000,000 per annum.

There are 30,000 men employed in the mines of Colorado out of a total population of 520,000.

The smelting industry of Colorado has been an all-important factor in the growth of its mining districts. There are ten large smelting works in the State (at Denver, Pueblo, Leadville and Durango), and several smaller plants whose activity is intermittent. The value of the entire product of the smelters amounted in 1898 to $61,000,000. This included the product from ores which came from neighboring States and from British Columbia.

At the present time 3500 tons are smelted daily in Colorado. The annual tonnage consists of 900,000 tons of ore, 300,000 tons of iron flux and 185,000 tons of limestone, the balance of the lime needed being obtained in the form of ores which carry more of it than is required for their own treatment. Aspen provides the bulk of the latter material.

The charges for treatment depend upon the composition of the ore, particularly the ratio of iron to that of silica. On a neutral basis the charge has been $4.25 for oxidized ores and $7 per ton for sulphide ores. On highly silicious ores, containing 60% to 70% silica, the charge is $8 per ton flat. Nineteen dollars per ounce is paid for the gold in ores carrying up to two ounces per ton, and $19.50 per ounce for those which are richer. Ores carrying less than two ounces go to the mills and the richer stuff to the smelters.

The dividends declared by the mines of Cripple Creek during 1898 amounted to $2,596,144, but to this figure must be added the profit made by mines not owned by the public companies, and also that of the numerous leasing parties, bringing the total dividends to fully $3,000,000.

Some additional notes concerning a few of the big mines will not be out of place. The Independence is one of the pioneer mines of the district. It was pegged out by W. S. Stratton on the 4th of July, 1891, and remained under his sole ownership until May 1st, 1899, when he transferred it to an English company, incorporated under the name of Stratton's Independence, Limited. This mine has never yet been pushed to its full capacity for production. In 1895 eight men, while engaged in development work, broke ore which netted an average of $155,000 per month for seven months in succession. Of the total area covered by the property, not one-quarter has as yet been explored. Up to May 1st, 1899, the mine had produced 44,224 tons, having a gross value of $4,071,860 and yielding a profit of $2,574,164. During the first quarter of the new company there were produced 9222 tons, having an average gold content of 4.02 ounces and a total gross value of $708,106.

The Portland adjoins the Independence on the north. Of its entire acreage only a little over 8% has been as yet explored. During 1898 the total receipts were $1,890,641, while the expenditure was $881,833 and the resulting profit $1,008,808. Dividends to the amount of $570,000 were distributed and additional claims were acquired. The surplus carried forward was $668,000. The total production of this mine to the end of 1898 has been 109,591 tons, having a value of $6,427,523. The average per ton is $58.65.

The Isabella became famous early in 1899 on account of rich discoveries which permitted of a resumption of dividends. Three separate shipments of over fifty tons each averaged forty-five ounces of gold per ton. This ore was obtained 20 feet above the ninth level.

Next to the Isabella is the Victor mine, which is said to have been bought in 1893 for $52,000 by Messrs. Moffat & Smith, who still control its operations. The dividends paid since then have an aggregate value of twenty-two times the purchase price of six years ago. The profit earned in 1898 was $323,724. The total output to the end of that year has been 12,242 tons of smelting ore and 82,249 tons of milling ore, having a total value of $2,161,186.

Regarding other mines above mentioned, it remains but to add that most of them have made much larger profits than the dividends indicate, the want of reserve capital causing the expenditure of part of the profits for the acquisition of adjoining territory or the carrying forward of a surplus to be used as necessity arises.

FUTURE PROSPECTS.—In the eighth year of its existence Cripple Creek produced $13,500,000, of which 22% was distributed in the form of dividends.

The present boundaries of the productive portion of the district are approximately identical with the area occupied by the andesite breccia and the other rocks of the volcanic complex. This covers about ten square miles. It is undoubtedly the proper territory for further exploration, and no part of it offers greater promise than the line of contact separating the breccia from the granite. Nevertheless the geological conditions outside this circumscribed area are such as to forbid hasty conclusions discouraging to prospecting in the granite which surrounds the district on all sides.

The recent discoveries of pay ore in Grassy gulch and on Copper mountain are suggestive of the probable extension of the boundaries of the gold field. It is known that the phonolite dykes which are associated with the productive lodes of the central area extend into the outer granite. Indeed, several rich mines are wholly in the granite, at distances varying from a few hundred feet to over 2000 feet from the breccia. The Strong and Gold Coin are notable examples, while among those most distant from the main mass of the breccia may be mentioned the Orizaba and Prince Albert on Beacon mountain, and the Sweet and Caledonia, west of Anaconda. It must not be thought that these mines exhibit an ore occurrence wholly distinct from the main volcanic complex. Such an idea would be unwarranted, because, while they are situated far outside the mass of andesite breccia, the gold-bearing lodes which they develop are associated with phonolite, in dykes and masses. The geology of Beacon hill is especially characterized by a very large intrusion of that rock.

It is not extraordinary that the vicinity of the contact of the granite with the breccia should be a favorable environment for large bodies of ore. The contact must have been, at all times, first a line of weakness, next a line of movement and consequent fracturing, and finally a line of water circulation. Thus there existed the conditions which experience and observation indicate as being most favorable to mineralization, especially when to these is added the penetration, across the contact, of bodies of volcanic rock, such as the dykes of andesite, basalt and phonolite. Although comparatively little ore has been found lying immediately upon the contact, there is plenty of proof, in the Independence, Portland and Granite mines, for example, of the fact that the lodes crossing it have been beneficiated. Similarly the phonolite dykes, when they pass out into the granite, have afforded a line of weakness along which fracturing has subsequently occurred, forming shattered planes and lines of maximum porosity, permitting of the circulation of the underground solutions which precipitated the precious metal. Every added page of evidence only further confirms the view, held by the writer early in the infancy of the camp, that Cripple Creek corroborates to a striking degree the most modern explanations of ore deposition chiefly associated with the name of Posepny.

Will increasing depth be accompanied by impoverishment? This is not asked with the timidity of a few years ago, when the lodes had only been followed 200 or 300 feet in vertical descent, and it was foreseen that they would eventually cut into the granite under the breccia. At that time the future of the district was uncertain, and many cautious men held back in fear of unfavorable developments. It is obvious that the mines near the edge of the depression occupied by the breccia will penetrate into granite by sinking their shafts or by extending their levels. This has occurred in the case of the Independence and Portland mines, which reach the granite on the southern and western sides of the territory owned by them. If good ore is found in the granite at a horizontal distance of 2000 feet from the mass of breccia, why should it not also be found at a similar vertical distance below the same formation? All the evidence to hand goes to show that wherever the dykes have broken through the rocks of the volcanic complex they have permitted of ore deposition, and that therefore the possibilities of future discovery are not limited to the present restricted known productive area.

The steady betterment in economic conditions tends continually to decrease the working costs and to make a commensurate addition to the tonnage of ore available for exploitation. This is the story of all modern mining regions. The Rand illustrates it; Kalgoorlie accentuates it. There is no immediate probability of any radical change in methods of ore reduction or transport, but there is a tendency in several directions to diminish the expense of handling

low-grade ores. Two railroads tap the district, and the competition prevents rates of transport being unduly high. The building of a third line is probable, should the production of the camp increase as it promises. Electric haulage is likely to become a factor in reducing this item of expenditure. The increased capacity of the mills, due to their steady enlargement and the better arrangement of the machinery, is permitting them to buy ores which at one time were considered to have no commercial value. Five years ago the minimum rate for freight and treatment was $12 per ton, while to-day it is $7 per ton. During the same period the smelter rates of treatment have dropped from $15 to $6.50 per ton. What a reduction such as this means, and how great a tonnage of low-grade material it transfers from the category of rock to ore, will be appreciated by those who have watched the growth of other districts.

In the general persistence of the ore bodies, in the size and continuity of the lode channels, and in the economic conditions favoring an easy realization of the values contained in the ores, Cripple Creek exhibits the features of a great gold field, and affords the promise of a future which will eclipse the achievement of the first eight years of its existence.

Laccolites and Their Relation to Ore Deposits.

NUMBER II.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS.

Aside from their peculiar geological interest, laccolites possess an additional attraction in their close association with ore deposits at a number of important localities. The first place to attract attention to laccolitic structure in connection with ore deposits was at Leadville, Colo., where the intercalated sheets of white and gray porphyry were recognized by S. F. Emmons as due to laccolitic uplift and intrusion, and Mr. Emmons also considered that these eruptive rocks had a direct and important relation to the ore deposits, concerning which he says:* "The dynamic movements which resulted in the elevation of the Mosquito range and produced its present complicated structure can be most readily explained on the generally received contraction theory, as the result of tangential pressure exerted upon the upper part of the earth's crust. * * * * * In the region under consideration the pressure would act from the east westward.

"After the deposition of the sedimentary beds in this area, there occurred during Secondary times an intrusion of igneous or eruptive rocks, which spread themselves out in sheets between the strata and became, as it were, an integral part of the sedimentary formation. It was after the eruption and consolidation of these masses of igneous rock that the dynamic movements producing faults, folds, etc., occurred.

"In their mode of occurrence the type feature is that of intrusive masses, which are developed on a scale of unprecedented magnitude, and follow certain horizons with remarkable regularity. These interbedded sheets are found to have a maximum thickness at certain points or along certain lines, and to become thinner in proportion to their distance from such central point, which is probably near a vent or channel through which they were erupted. This form resembles the structure of the intrusive masses of the Henry mountains which have received from G. K. Gilbert the name of laccolites. Nor is the resemblance confined to external structure, but extends also to the internal texture and mineralogical composition. It is probable that this mode of occurrence of eruptive rocks, viz., as intrusive masses, which did not originally reach the surface, but were forced up to a certain horizon and then spread out between the beds, is far more common than has hitherto been suspected by geologists.

"It is difficult to conceive of the conditions under which a fused mass could pry open strata to a width of 1000 feet or more, overcoming the weight of 10,000 feet of superincumbent rocks, and spread itself out in a continuous sheet between the beds to a distance of ten miles from the point of line of eruption. That they did exist, however, can be clearly demonstrated in this region, thanks to the intense action of folding and faulting, and the enormous amount of erosion which has taken place since such eruption, and afforded exceptional opportunities for a study of their form and extent."

That there were several laccolitic uplifts in the Leadville region is evident, and the material from the several vents varies. There are no less than fifteen separate sheets extending over large areas, reaching from the Cambrian to the Jurassic and possibly higher.

Some of these beds may be traced for miles. They follow usually one plane in the sedimentary horizon, but instances are noted where they have abruptly changed, cutting across a bed and continuing at a higher or lower plane. Later sheets have also intersected older ones of different character of rock in Leadville district. It is only by an extended observation and study of the region that this structure becomes evident as the continuity of the strata, both sedimentary and eruptive, is frequently interrupted by faults which are planes of displacement, exceeding in one case 2000 to 5000 feet, as in the Mosquito fault. Those in the lower part of the district—from Breece Hill downward toward the town of Leadville—vary from a few feet to 1200 feet, the latter at the Iron fault, between Carbonate and Iron hills.

*Geology and Mining Industry of Leadville, U. S. G. S. Monograph, XII.

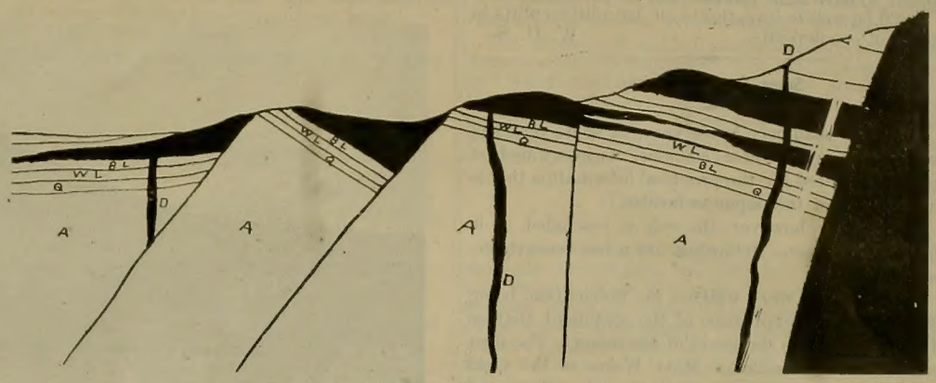

Fig. 4.—Section at Leadville, Colo., Showing Laccolite.

The accompanying sketch, Fig. 4, represents the occurrence of the laccolitic sheets in the Leadville district. The ore occurs at several horizons, but chiefly in the blue limestone marked B.L. The eruptive rocks, porphyries of various kinds, are represented by the black portions. The vertical irregular bands represent later intrusive dykes, and the inclined sharp lines show several faults, that at the center being the Iron fault above referred to. The main mass of the laccolite lies farther to the eastward than indicated in this sketch, but conveys the idea as well as a sketch drawn to scale.

Strangely, the intrusion of laccolitic sheets do not appear to metamorphose the sedimentary beds to any great extent. Occasionally quartzites or sandstones are found to have developed feldspathic crystals as a result of contact metamorphism. Concerning this in Leadville, Mr. Emmons says: "There is a notable absence in this region of strongly marked contact phenomena in the sedimentary beds—that is, changes which have resulted from the contact of a fused mass, such as a baking or vitrification. The changes which are found in them near intrusive masses are evidently rather the result of the action of percolating waters."

In regard to the genesis of the Leadville ore deposits, Mr. Emmons concluded that "they were derived from aqueous solutions; that these solutions came from above, and that they derived their metallic contents from the neighboring eruptive rocks."

As the overlying eruptive rocks are the laccolitic sheets, Mr. Emmons conceived that the ore deposits were derived directly from these rocks.

The geology of Leadville is not complex, excepting in a few local instances. Indeed, it is very simple, consisting of regularly bedded deposits of quartzites and limestones, conglomerates and grits, interbedded with sheets of intrusive igneous rock, the entire series lying non-conformably upon the Archæan granite and gneissoid rocks. These formations are folded, tilted and faulted, as previously described, and this, together with exposure by erosion, has rendered a complete study of the geology of the district possible. The laccolitic sheets were intruded prior to the folding and faulting, and it is not improbable that ore deposition occurred prior to these movements of displacement. The physical condition of the ore deposits themselves at and near fault planes and in the anticlinal domes or synclinal basins attest this.

Aspen mining district, in Pitkin county, Colo., is also an area of laccolitic intrusion, but the intrusive sheets are fewer in number than at Leadville, and they have only an indirect connection with the ore bodies. The geology of Aspen, though normally simple and not unlike that of Leadville, has been rendered most complex by a series of faults, thrusts and folds, in some cases often repeated in close proximity, rendering an understanding of the geology of the district very perplexing. The quartz-porphyry of Aspen is similar to the white porphyry of Leadville. Mr. Emmons, in speaking of the source of the Aspen porphyry, says:

"Beside the main sheet, there were found in several places in the vicinity of Aspen crosscutting dykes, vertical or nearly so, which may connect the bedded sheet with some concealed body of porphyry below. One of these localities is on Aspen mountain, at the Bonnybel mine; the others are on Smuggler mountain, at the Bushwhacker and Park-Regent mines and in the Smuggler. It is also shown in the Bonnybel mine that a few small sheets were sent out from the dyke, along the bedding, altering the dolomite to marble on their contact. Along the fissures represented by these dykes much molten material must have ascended. It has been shown by various geologists that the great sheets, and even the laccolitic bodies, of intrusive rocks, which are so common in the Rocky mountain region, have ascended along narrow fissures; and the whole body of porphyry at Aspen may well have come up through a few such dykes as have been observed."

From the above it will be seen that the ore bodies of both Leadville and Aspen have a close association with laccolitic intrusions, whether the genesis of the ore deposits be directly due to the laccolite or not.

In South Dakota, in the northern Black Hills, laccolites occur in numerous places, and in a number of instances these are found to be associated with ore bodies of commercial value.

As in Leadville, the rocks vary in character, though the geological structure is similar. The largest laccolite in the Black Hills is that having Terry peak as a nucleal core. This great mass of intrusive material has sent out several sheets into the Cambrian and Carboniferous formations which surround the peak on all sides; but, in addition to this great laccolite, there are numerous smaller ones. They are found along Squaw creek, in the Carbonate camp, on Two-Bit gulch, at Galena, to the northward of Deadwood and elsewhere. Some of these are of limited occurrence, and, though small, form typical laccolites. All of these do not appear to be associated with ore deposits, but the most of them are. The Potsdam ore bodies, which occur scattered over an area of more than sixty square miles, are almost invariably associated with laccolitic sheets.

While this is true, it has not been possible to trace the origin of these ore deposits directly to the laccolites, but there is much to indicate that the ore deposits have a direct relation to the intrusive dykes which are later than the laccolites, and are often found to have cut through the sedimentary beds and the laccolitic sheets as well.

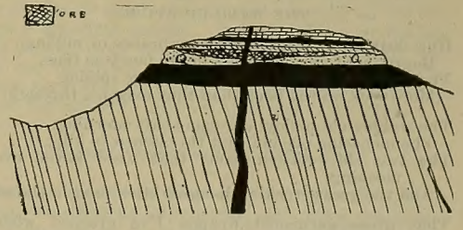

Fig. 5.—Ore Deposit Above Laccolite Sheet

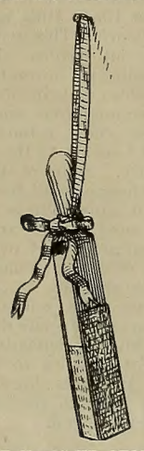
This occurrence is illustrated in Fig. 5, which is a typical occurrence of an ore deposit of this region, associated with a laccolitic intrusion and also with a dyke. The latter cuts through the underlying pre-Cambrian crystalline rocks intersecting the large laccolitic sheet separating the Cambrian quartzite from the underlying slates and schists of the Algonkian. At a higher level is seen a second, though smaller, sheet of similar rock. The ore occurs in and upon the quartzite. In many cases the laccolitic sheets are found both immediately above and below the ore deposit and in contact with it.

While these sheets of intrusive rock are of widespread occurrence, that of the ore is local and is usually confined to the vicinity of the dykes. The ores occurring under these conditions are telluride gold ores and lead-iron silver ores. The erosion of this section has been so extensive that only small remnants of the original sedimentary formation usually remain, and superior opportunity is thus afforded for a study of the occurrence of the laccolites. Particularly is this the case in the Carbonate camp, on Squaw creek and on Two-Bit gulch. Six miles north of Deadwood a large intrusion of rhyolite has lifted the sedimentary beds of the Cambrian, tilting them in dome-like form, the rhyolite separating the sedimentary beds from the Algonkian, but the intrusive rock was not observed to have broken through the sediments. No ore has as yet been discovered there.

On the whole, while laccolites occur at numerous places in the Rocky mountain region, as stated by Mr. Emmons, they are likely to occur more commonly than has generally been supposed. They are found associated at a number of places with extensive ore deposition and to such an intimate extent as to have led to the belief at one time in Leadville that the metallic contents of the ores were derived directly from the



laccolitic sheets; but, as geologically similar ore deposits are found in Leadville and elsewhere not in contact with these laccolitic sheets, and as sufficient evidence has been found to associate the genesis of these ore deposits directly with the vertical dykes accompanying the ore bodies, it appears that laccolites are merely an incidental feature of the geology of these deposits and not essential to their creation. However, as ore deposition and laccolitic intrusions appear to have some relation, not as yet understood, it would be well to investigate all laccolitic uplifts in search of ore deposits. W. H. S.

Some Seemly Rhymes.

Not more than once in ten years or so do verses of poetry appear in these columns, as every inch of space is required for the practical information that is the province of the paper to furnish.

Occasionally, however, the rule is rescinded, as in the present case. Following are a few recently received.

None of them were written for publication, being extemporaneous expression of the sentiment that so often springs from the heart of the miner. The first was written by millman Matt Waite of the Gold Bank mine, Forbestown, Butte county, Cal., and accompanied a miniature "hang-up stick," about two inches long, festooned with ribbon, sent to his friend Harry Leavitt of San Francisco. The little "hang-up stick" and the verses are here reproduced:

THE HANG-UP STICK.

How dear to my heart my remembrance of milling,
Reproduced are the scenes in my fancy so true:
The leaky ore feeders that always were spilling
More rock on the floor than they ever fed through.

The wobbly old pulley, our cam-shaft adorning,
The menacing ore bin that threatened to kill;
The two old cracked cams that were keyed every morning,
And the grease-reeking hang-up stick used in the mill.

That grease-garnished weapon I've grasped with a feeling,
When often at noon from my luncheon I flew;
What a gift of profanity I was revealing,
As I hung up a stamp that had broken a shoe!

The greasy old "cam-post," the chain blocks hung near it,
The sledge and the drifts and the shims that don't fill;
And George's shrill whistle—a dead man could hear it—
As we rushed for the hang-up stick used in the mill.

But now far removed from that grease-smeared condition,
No tears of regret do my eyes ever fill;
Yet I hail as an old friend this pigmy edition
Of the grease-festooned hang-up stick used in the mill.

The next is written by L. Clare Davis of Stockton, Cal., kindly sent us by Mr. Ziegenfuss, editor Citizen, San Andreas, Cal.:

A MINER'S CANDLESTICK.

Oh, my old candlestick, you're my constant friend
Down under the ground where the shadows blend,
And a man's shut away from the good God's light,
From the blush of dawn to the hush of night;
Where a child's merry laugh, or a bird's low trill,
Never can fall like a light, rippling rill
To sing to the miner of cheer in his home
And ring in his heart like an old love tome.
A drill makes the music that rings in his ears,
But a candle's the charmer to drive away fears.
Down deep underground where grim shadows are thick—
Here's to you always, my old candlestick!

Aye, many's the time we have had here at night
When darkness was playing tag with the light,
Where the flecked clouds of quartz and the glint of gold
Spun themselves into dreams that cannot be told.
You're a weapon of war for the skulking foe—
My one friend that sticks, wherever I go.
Yes, grimy the hands are that swing the old pick,
But while there's yet life to our post we will stick.
The swing of the hammer, the ring of the drill,
Are dear to the soul of the miner still;
But mem'ries that stir me, and prove to the quick,
Are all twined about you, my old candlestick.

The following bit of homely philosophy is from Frank Aley of Globe, Arizona:

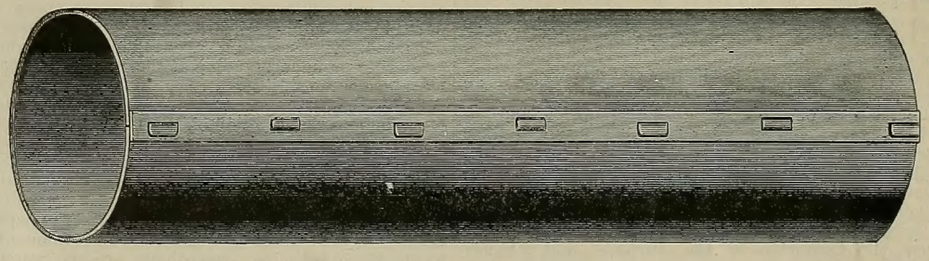
THE PROSPECTOR'S PHILOSOPHY.

"Has existence been a failure in yeour specific case?"
"Chuck" ask'd me with a shadder on his good old honest face,
And at first I had to answer, it seemed to me it had,
Though my history from childhood was not so very bad—
But say!

When I cum to think about it, it sorter seems to me,
There wuz two sides to the question, if there wuzn't two or three;
True, I hadn't any money, nur property, nur sich,
I wuzn't very hansum, nur popular, nur rich,
Nur nuthin'.

I never made a splutter in the Legislatur halls,
Whur Honorable Bill So-and-So, gits up and kicks and balls,
Whur a 25-cent statesman, with bizness in his eye,
Sells his honor fur a nibble uv administration pie,
O, no!

I never run fur office, I couldn't if I'd try,
The people wants a feller with a twinkle in his eye,
Who talks and smiles and wriggles, in his scientific play,
Then turns around and robs 'm in the good old fashioned way,
Yes, indeed.



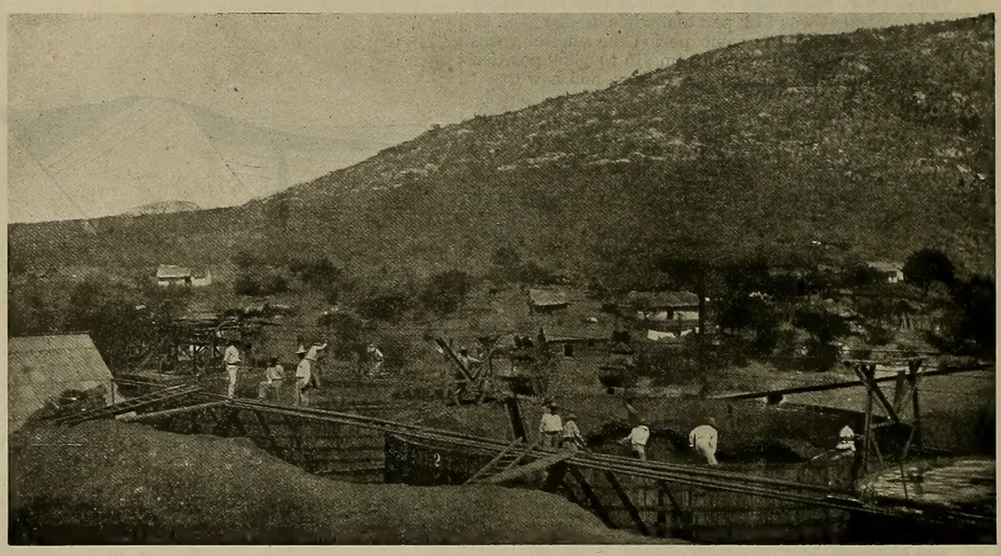
Cum to think, there's another defalcation in my case,
I can't look into the winder and behold a baby face,
And another jist behind it, full uv happiness and love,
Jist as though it wuz an engel, cummin' to 'm frum above,
Well, well!

Guess I won't discuss that subjec', sorter ten's to make me blue,
Sets the boys to askin' questions, "What the devil 's ailing you?"
Nothin' to 'm, yit I reckon, they all have their loads to tote,
And you'll find they're all a sailn' in the same old boat.
You bet.

But I've hit upon a system that never fails to fit,
When I can't git jist what I want I'll take what I can git,
And I'm not disposed to worry, while there's monarchs in their might
Who'd gladly give their riches fur half my appetite.

Clinched Sheet Steel Pipes.

A Chicago concern is making a clinched pipe, illustrated herewith, from steel up to No. 8 gauge, and from 3 to 16 inches size—a sheet steel pipe with invisible side joints, in lengths up to 10 feet.



Clinched Sheet Steel Pipe.

THE Geographical Society of the Pacific, San Francisco, Cal., has official notice that it has been selected as a depository on the Pacific coast for all charts issued by the U. S. Geological Survey.

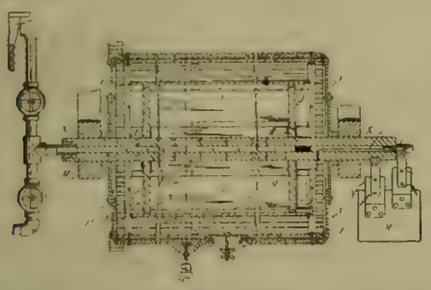
El Progresso Mines of Lower California.

Near Triunfo, Lower California, are the mines of El Progresso Mining Co. The original company was organized in 1862 for the purpose of developing these properties, but failed, as did also their successors. A concession was granted El Progresso Co. by the Mexican Government in 1897, and a large industry has been built up at these mines, said to be the oldest known silver mines in Lower California. The machinery installed at the mines is valued at $250,000, the plant including a 40-stamp mill, hoisting machinery, drills, air compressors, engines, etc., and a complete cyanide plant, an illustration of a portion of which appears herewith. A narrow-gauge railroad conveys ore from the mines to the mill, and employment is given to 1000 men the year round. The annual operating expenses are stated to be $650,000, Mexican. It constitutes one of the largest mining concerns in Lower California. All supplies for these mines pass through the port of La Paz.

Portion of Cyanide Plant at El Progresso, Lower California.

AT Aubervilliers, France, is a factory for the electrical seasoning of timber. The seasoning vats are in a line under traveling cranes, used to transport the timber. Their length is from 4½ to 13 yards; their width from 5 to 10 feet; the depth is constant, 5¼ feet. Each vat is supported on insulators. The platform in the vat on which the timber rests is directly supported on the plungers of hydraulic cylinders, by which the charge of timber can be readily lifted clear of the liquor. In this way the vat is recharged. The timbers are stacked in alternating longitudinal and transverse layers, the heavy upper electrodes then laid on the charge, lowered by the hydraulic cylinders until the electrolyte reaches the desired height around the wood. The heat required for the solution is obtained by means of steam coils. Monthly the organic materials escaping from the wood are removed from the bath by raising the solution to boiling point. The organic materials then rise to the top and are skimmed off. The nine vats provide for the simultaneous treatment of about 3200 cubic feet of timber.

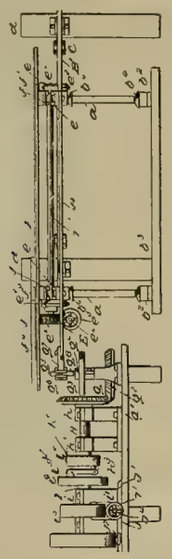
IN a recent experiment made with superheated water, it is asserted an ordinary passenger coach on the New York Central Railroad was moved fifteen miles at an average speed of twenty-five miles an hour at an actual cost for power of 5 cents. The power is generated in an apparatus consisting of upright steel tubes joined together at the top and bottom, so as to permit of perfect freedom of expansion and contraction, thorough impingement of the heat applied and natural circulation of the water, the whole resembling an ordinary upright steam radiator. The water is heated to a temperature of 500°, or 150° more than the temperature of steam in a typical locomotive boiler. A tank carried on the vehicle or car can take



the water from the generator at the rate of 300 pounds a minute, and the loss of heat by radiation is avoided by the use of lagging. When released into the engine the water expands nearly 1000 times.—Electricity.

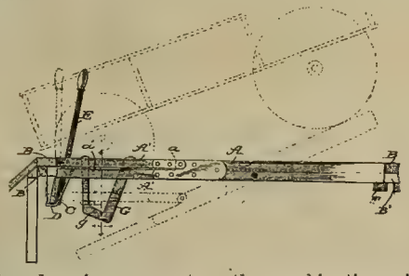
Latest Mining and Metallurgical Patents.

Patents Issued Dec. 26, 1899.



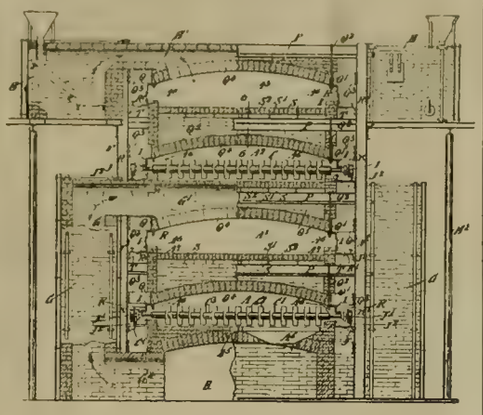
Specially Reported for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR EXTRACTING PRECIOUS METALS FROM ORES.—No. 639,766; L. E. Porter, Los Angeles, Cal.



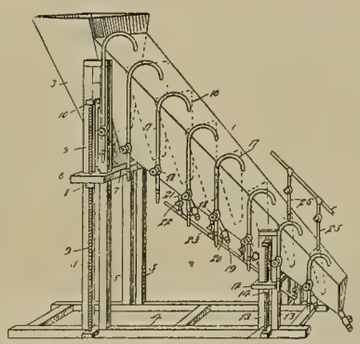
A machine for extracting precious metals from ores, comprising a rotating barrel adapted to contain the ores, chemicals for treating the same and also the evolved gases under a considerable pressure; barrel being provided with a valve opening having an external valve seat; a valve arranged to close such opening; a valve guide secured to the barrel and having a guide opening to receive the stem of the valve; a coiled spring encircling the valve stem and engaging with the valve guide to hold it against a given pressure of the evolved gases; a tension nut for regulating the tension of the spring; a pivoted lever having one end secured to the valve stem and having its other end arranged to be engaged by a trip arm; a trip arm arranged to engage the lever; and an adjustable tension for regulating the pressure of the trip arm; arms secured to spiders; supporting rings secured to the arms; frames secured to the rings; the carbon plates secured upon the frame; and a source of electrical energy having one pole connected with the barrel and the other pole connected with the carbon plates.

ORE CONCENTRATOR.—No. 639,920; H. H. Cramer, Aspen, Colo.



An ore concentrator, comprising a table, a support therefor having universal bearings, means for imparting a differential rotary movement to table, springs connected to support, and a longitudinally movable bar at one side of table and to which springs are also connected.

DUMPING APPARATUS.—No. 640,036; B. Sims, Paris, Illinois.



In a dumping apparatus, the combination with a frame having wheel stops, of rails pivoted in rear thereof, lever sections hinged to rails on the upper side, and provided near their front ends with lateral projections, hangers having inclines at their lower ends upon which lugs are adapted to strike and slide downward, and a tripping device, as shown and described, whereby rails and lever sections are adapted to assume a lower position and a greater or less angle to each other, according to the variation in diameter of the wheels of cars or wagons run upon the rails, so that practically the same inclination of the car or wagon bodies is obtained in all cases.

CALCINING FURNACE.—No. 640,058; A. H. Wethey, Butte, Mont.

A furnace structure comprising a series of superposed horizontal hearths and roof arches therefor, the same being separated by slots at the sides, two opposite rows of vertical posts arranged aloug the side walls of the hearths, longitudinal beams upon which the arches rest at the sides, means connecting the beams with the posts and supporting them upon and spacing them from the latter, rakes arranged on the hearths, and projecting through the side slots, carriages for carrying the ends of the rakes, rails for carriages, and supports for the rails upon which the latter are held in the lateral spaces intermediate the posts and the sides of the hearths. The furnace having two or more ovens with the roof of one oven and the floor of the one next above connected together, and provided along their sides with horizontally arranged metal beams, ovens having open slots at the sides, a series of vertical posts offset from the horizontal longitudinal beams, means for sustaining the roofs and floors, means being arranged between connected roofs and floors on one hand and the vertical posts on the other, and connected and supported upon the vertical posts, a rake extending through the oven, and having upon its ends truck wheels arranged between the horizontal longitudinal beams and posts, and rails or trackways exterior of the furnace walls and upon which the above-named wheels run. A calcining furnace comprising two opposite rows of vertical posts spaced away from its side walls, hearth and rail supports extending inwardly from the posts, rails arranged between the walls and posts, a plurality of superposed hearths or floors and roof arches located in different horizontal planes and having side and end walls provided with spaces which separate the hearths vertically from their arches, walls having continuous open slots traverse beams and stirrups partially supporting the arches and connecting the hearths with the posts, chains extending parallel to the side slots, and exterior of the furnace walls, pulleys on which chains run, and stirring devices secured to chains and having their ends extended transversely through the side slots, whereby the stirring devices may traverse and be carried from one hearth floor around its end to another.

ORE CONCENTRATOR.—No. 640,117; H. Earle, Canyon, Colo.

An ore concentrator, comprising an air-tight chute or casing substantially V shape in cross-section, a receiver for material at the upper end of chute or casing, and adapted to discharge material into chute or casing, means for supporting the chute or casing in an inclined position, vertically disposed partitions in the chute or casing, forming end walls of compartments, a siphon pipe leading from each compartment through the top of the chute or casing, valves in siphons, and valve-controlled discharge pipes leading through the bottom of the chute, the inlet ends of pipes being directed toward the upper end of the chute, water jet pipes arranged adjacent to the inlets of discharge pipes, and a pipe for supplying water to the chute or casing in its several compartments.

PROCESS OF AND APPARATUS FOR MAKING COPPERAS.—No. 640,026; A. S. Ramage, Cleveland, O.

The process of making commercial copperas from liquor containing sulphate of iron and free sulphuric acid which consists in neutralizing the free acid by the addition of a form of magnesia which will make magnesium sulphate with the free acid, but will not decompose the sulphate of iron, and evaporating the resultant liquid.

The Occurrence of Tin.

The tin deposits of Cornwall have been almost continuously worked since the earliest times. In the St. Just district, West Cornwall, the prevailing rock is granite, which is frequently traversed by elvans or dykes of quartz-porphyry. Overlying the granite in places a killas or indurated clay-slate is found. Sometimes the tin occurs in the slate; but more frequently it is found in the granite or quartz-porphyry in lodes and dykes. It is found that when the lodes are large they are highly productive, and when they become small they yield but little tin.

In the Botallack and Levant districts tin occurs in many instances in flat lodes or floors. In the Botallack mine a number of parallel floors, alternating with an ochreous ironstone nearly 60 feet thick were worked. This singular deposit was in slate country close to the granite. In the St. Ives Consols mine tin was found in large lenticular lodes termed carbonas, composed of a gangue of schorl (black tourmaline) and occurred in granite.

On Carn Brea a lode has been extensively worked. It was formed by a small quartz leader, seldom more than 2 inches wide, which occupied the space formed by the grinding away of the walls of a fault. A mass of schorl rock from 4 to 15 feet wide, and containing from 1 to 3 per cent of cassiterite distributed through it in fine grains, coarse crystals, or little strings, occurred, sometimes on one side, sometimes on both sides of the quartz leader. The schorl rock passed into the quartz and into the granite and slate walls without any perceptible break occurring.

It is interesting to know that there appears to be no impoverishment of the tin in the Cornish lodes at depth. The Dalcoath mine, which has been worked almost continuously since 1799, and in which the main shaft has now reached a depth of 3000 feet, produces ore at the present time almost as good as the ore when it was first opened. It is regularly producing 2000 tons of block tin per annum from 3 per cent ore, and the directors have such a high opinion of the mine's prospects that they have determined to equip it and the mill with modern American machinery.

Proposed Government for Nome Beach.

Cape Nome miners want some definite ruling as to mining locations at Cape Nome, and have petitioned Congress that all shore lands of Alaska and adjacent islands lying between the line of vegetation and 50 feet seaward of low water mark be exempted from ordinary placer locations under the general laws of the United States and be made subject to miners' license to be issued for the term of one year to persons entitled by existing laws of the United States to locate mining ground. Such annual license locations to occupy a frontage of not to exceed 50 feet along the line of vegetation and to extend thence seaward; such license locations to be made and recorded in the same manner, as far as practicable, as placer locations under the general mining laws of the United States and to be subject to the same local mining rules, regulations and usages as apply to placer mines under existing laws of the United States; such license locations to be subject to the right of all persons to have access to and from the sea, and the use of the water thereof for general mining purposes, and such license shall not interfere with commerce and navigation. They also ask that the location of mining claims in said district of Alaska under and by virtue of powers of attorney be prohibited.

THE London Lancet says that if at a height of more than 4000 feet to 5000 feet above the sea sevel a certain amount of strain is put on a normal heart, and by a rise of pressure indirectly also on the large peripheral arteries, this action is multiplied in the cases of heart troubles or in the cases of arteries with thickened or hardened walls. It is specially the rapidity of the change from one altitude to another which must be considered as a call made upon the contractibility of the small arteries on the one hand, and on the amount of muscular force of the heart on the other hand, and if the structures in question did not respond to this call, rupture of an artery or dilation of the heart may ensue. In the case of people totally unaccustomed to high altitudes, it is desirable to take them by degrees, in two or three stages,

A Decision Affecting Oil Lands.

Following is the full text of the decision recently rendered by Judge Ross in the United States Circuit Court at Los Angeles, Cal., in the case of the Nevada Sierra Oil Co. vs. Home Oil Co.:

The subject of controversy in this suit is a piece of public land of the United States, containing under its surface petroleum, and to which both the complainant and the defendants claim to be entitled under and by virtue of the mining laws. As the defendants are extracting large quantities of oil from the ground and prevent the complainant from doing the work thereon required by the laws of the United States in order to make good its alleged claim, an application has been made by it to the Court for the appointment of a receiver to take possession of the property and operate it and do the required work, pending the litigation, for the benefit of the party that may ultimately be adjudged to be entitled to it—the respective parties agreeing that by reason of the operation of wells on adjoining lands no injunction ought, in any event, to be issued, because such action would necessarily result in the draining of a large part of the oil from the land in controversy by those operating the adjoining territory. Upon the hearing of the application a large amount of testimony was introduced on behalf of the respective parties, consisting in great part of conflicting affidavits. In respect to this conflict of evidence the Court would not undertake, at this stage of the case, to make a decisive determination; but if the proof, taken as a whole, shows reasonable ground for the complainant's claim to the land in question, then, clearly, it will be the duty of the Court to appoint a receiver to take possession of it pending the litigation, to the end that the annual work required by the laws of the United States may be performed for the benefit of the party who may ultimately prevail in the suit, and in order to conserve the property for the benefit of the party entitled thereto and prevent the extraction and dissipation, pending the litigation, of the oil, which the proof shows constitutes the chief, if not the only, value of the land. But unless the proof does show that the complainant's case has a reasonable ground to rest upon, it is the duty of the Court to deny the application for courts of equity do not lightly appoint receivers to take property out of the possession of any party.

The undisputed evidence shows that on the first day of January, 1893, the ground in controversy was unappropriated public land of the United States, which had been theretofore surveyed, and by that survey designated as the northeast quarter of section 20, township 19 south, range 15 east, Mount Diablo base and meridian, containing 160 acres, and that on the day named J. E. Wilson, for himself and seven other persons, all of whom were competent locators, undertook to locate the ground under the mining laws of the United States, posting thereon a notice of location claiming the quarter section as a consolidated mining claim, and, it is contended, marked its boundaries in accordance with the requirements of the law. It is not pretended that Wilson or any of his associates remained in actual possession of the land or did any work thereon under that location. On the contrary, one of the averments of the bill is that on the first day of January, 1896, the land was unappropriated public land of the United States open to location under the mining laws. The undisputed evidence also shows that in the year 1895 Frank Barrett undertook to locate the same ground, for himself and seven other persons, as a consolidated mining claim, pursuant to the same laws; but neither he nor any of his associates remained in the actual possession of the ground or did any work under that location. The evidence leaves no room to doubt that on the first day of January, 1896, the land was unappropriated public land of the United States, on which day, as has been said, Wilson undertook, in behalf of himself and his seven former associates, to make a second location under the mining laws, posting thereon the required notice of location, and, it is contended on the part of the complainant, marking the boundaries in accordance with the requirements of the statute. Assuming that to be so, the difficulty with his location of January 1, 1896, is that the proof fails to show that he made, prior to the posting of the notice and the marking of the boundaries, or subsequent thereto under that location, any discovery of mineral in or upon the land. The bill alleges that at the time of the posting of the notice of location of January 1, 1896, Wilson discovered seepages of oil on the land in question, as well as oilsand and shale, but there is no showing in the proof that he discovered any seepages of oil on it. On the contrary, I think the evidence shows beyond any doubt that there never were any seepages of oil on that quarter section of land. There is evidence on the part of the complainant going to show that Wilson discovered sandstone and shale thereon, as well as on adjoining lands, and that there were seepages of oil on some of the adjoining lands, as also wells on one of the adjoining tracts, which were producing more or less oil. But these were nothing more than indications of existing oil under the surface of the ground in question, which might or might not prove to be true. Mere indications, however strong, are not, in my opinion, sufficient to answer the requirements of the statute, which requires, as one of the essential conditions to the making of a valid location of unappropriated public land of the United States under the mining laws, a discovery of mineral within the limits of the claim. (Revised Stats., Sections 2320, 2329; Waterloo M. Co. vs. Doe, 56 Fed. Rep., 685.) Indications of the existence of a thing is not the thing itself. It is entirely true that the statute, requiring as a condition to a valid location, the discovery of mineral within the limits of the claim should, as between conflicting claimants to mineral lands, receive a broad and liberal construction and so as to protect bona fide locators who have really made a discovery of mineral, whether it be under the statute providing for the location of vein or lode claims, or placer claims. As was well said by Judge Hawley in Book vs. Justice Mining Co., 58 Fed. Rep. 106, 120, in speaking of vein and lode claims: "When the locator finds rock in place, containing mineral, he has made a discovery, within the meaning of the statute, whether the rock or earth is rich or poor, whether it assays high or low. It is the finding of the mineral in the rock in place, as distinguished from float rock, that constitutes the discovery, and warrants the prospector in making a location of a mining claim." So in respect to placer claims, if a competent locator actually finds upon unappropriated public land petroleum or other mineral in or upon the ground, and so situated as to constitute a part of it, it is a sufficient discovery within the meaning of the statute, to justify a location under the law without waiting to ascertain by exploration whether the ground contains the mineral in sufficient quantities to pay. The question whether a particular piece of the public land is more valuable for mineral than for agricultural purposes is one that does not arise in cases like the present. While, as has been said, the statute requiring a discovery of mineral as one of the essential conditions of a valid location of land under the mining laws should be liberally construed in behalf of bona fide locators, no court would be justified in ignoring the statutory requirement. Mere indications of mineral, I repeat, do not constitute the discovery of the mineral itself. If so, a location made upon the discovery of such indications, followed by the proper marking of the boundaries of the claim and the doing of the statutory amount of work within the prescribed time, whether the work resulted in the actual discovery of mineral or not, would entitle the locator to apply for, and upon due proof and payment, receive the Government title to the land as mineral land; which obviously would not only be unauthorized by any provision of the statute, but would be in direct conflict with the sections already cited.

What has been said in respect to the absence of any discovery of mineral by Wilson on January 1, 1896, equa ly applies to his pretended location of January 1, 1893, and to Barrett's pretended location of the same ground in 1895, under whom the defendants claim Barrett, during the year 1895, undertook to transfer his right to the ground in question, which had no existence in fact or law, to the Producers' & Consumers' Oil Co., which company, later, undertook to transfer the same thing (which was nothing) to the defendant Miller, and on December 31, 1896, Miller undertook to relinquish to the United States what he did not have, namely, a right to the land in question, and immediately thereafter, to wit, on the 31st day of December, 1896, without having made any discovery of mineral upon the land, undertook to locate the quarter section in question under the mining laws, for himself and seven other persons, by posting the required notice and marking the boundaries. Shortly thereafter he undertook to confer upon Barrett the right to enter upon and explore for and develop oil upon the claim, and to dispose of the oil found there. Barrett thereupon went into actual possession of the land and early in 1897 erected a derrick thereon, and commenced boring for oil, and shortly thereafter transferred, with the consent of Miller, whatever rights he acquired from him to the defendant Home Oil Co., which company proceeded with the boring, and in October or November, 1897, at a depth of about 800 feet, actually discovered oil in the ground, since which time it has remained in the actual possession of the claim and bored several other wells, several of which proved to be flowing wells and in the aggregate yield a large quantity of oil. It would thus seem that, if the location made by Miller and his associates on the 31st day of December, 1896, was properly marked upon the ground and the notice of the location properly posted, followed, as it was, by the actual possession of the ground by those claiming under it and by the actual discovery of mineral within the limits of the claim by them, the requirements of the United States statute in respect to the location of mineral land were answered, no rights of any third party having in the meantime intervened. As said by the Circuit Court of Appeals for the eighth circuit, in the case of Erwin vs. Perego, 93 Fed. Rep, 609-611: "The Acts of Congress prescribed two, and only two, prerequisites to the vesting in a competent locator of the complete possessory title to a lode mining claim. (And the same rule is by the statute made applicable to placer mining claims.) They are the discovery upon unappropriated public land of the United States, within the limits of his claim, of a mineral-bearing lode and the distinct marking of the boundaries of his claim, so that they can be readily traced. No appropriation of the land is made until both these requirements are fulfilled, and until that time the lode and land sought are open to location and appropriation by any competent locator; but when these requirements have been complied with the land is no longer public, but the possession, the right to the possession, and the right to acquire the title are irrevocably vested in the locator." The Court, in the case cited, proceeded to hold that, in the absence of any intervening rights, it is immaterial that the discovery is not made until after the posting of the notice and the marking of the boundaries of the claim, saying that the order in which the statutory requirements are complied with is immaterial so long as the rights of others do not intervene before they are complied with; that the "marking of the boundaries of the claim may precede the discovery, or the discovery may precede the marking; and if both are completed before the rights of others intervene the earlier act will inure to the benefit of the locator as of the date of the later and a complete possessory title to the premises will vest in him as of the later date"—citing Jupiter M. Co. vs. Bodie Con. M. Co., 11 Fed. Rep., 666; North Noonday M. Co vs. Orient M. Co., 1 Fed. Rep , 522; Zollars vs. Evans, 5 Fed. Rep., 173; Strepy vs. Stark, 5 Pac., 111; Thompson vs. Spray, 72 Cal., 528; Erhardt vs. Boaro, 113 U. S., 527. All of this, however, is based upon the supposition, as is expressly shown in the opinion of the Court, that the location has also been made in conformity with any valid State legislation that may exist in the particular State in which the mineral land is situated, and with any valid local rules and regulations of the mining district in which the land may be situated, if any such exists. Section 2324 of the Revised Statutes makes the manner of locating mining claims and recording them subject to the laws of State or Territory, and the regulations of each mining district, when they are not in conflict with the laws of the United States. Kendall vs. San Juan Silver M. Co., 144 U. S., 658. At the time of the actual discovery of oil upon the tract of land here in controversy by the defendant Home Oil Co. in the fall of 1897, at which time, if at all, the location under which the defendants claim became complete, there was in existence an Act of the Legislature of the State of California entitled: "An Act prescribing the manner of locating mining claims upon the public domain of the United States, recording notices of location thereof, amending defective locations, and providing for the deposit of district records with County Recorders, and prescribing the effect to be given to recordation of notices of location and affidavits," approved March 27, 1897 (Stats. of 1897, page 214), the first, second, third and sixth sections of which are as follows:

"Section 1. The location of mining claims upon the public domain of the United States shall be made and perfected as provided in this Act.

"Sec. 2. The discoverer of any vein or lode shall immediately, upon making a discovery, erect at the point of discovery a substantial monument or mound of rocks, and post thereon a preliminary notice which shall contain:

"First—The name of the lode or claim.

"Second—The name of the locator or locators.

"Third—The date of the discovery.

"Fourth—The number of linear feet claimed in length along the course of the vein each way from the point of discovery.

"Fifth—The width claimed on each side of the center of the vein.

"Sixth—The general course of the vein or lode, as near as may be.

"Seventh—That such notice is a first or preliminary notice.

"Such notice shall be recorded in the office of the County Recorder of the county in which the same is posted within twenty days after the posting thereof. Upon the erection of said monument and posting such notice, the discoverer shall be allowed the period of time specified in section three of this Act to enable him to perfect his location as hereinafter provided.

"Sec. 3. Within sixty days from the date of the discovery of a vein or lode, the discoverer must perform fifty dollars' worth of labor in developing his discovery, and distinctly mark his location on the ground so that its boundaries can be readily traced, and must file in the office of the County Recorder of the county in which this claim is situated, a certificate of location, which said certificate shall state:

"1. The name of the lode or claim.

"2. The name of the locator or locators.

"3. The date of discovery and posting of the notice provided for in section two of this Act, which shall be considered as the date of the location.

"4. A description of the claim, defining the exterior boundaries as they are marked on the ground, and such additional description by reference to some natural objects, or permanent monument, as will identify the claim.

"5. A statement that such certificate is the final or completed notice of location, and that he has performed the aforesaid fifty dollars' worth of labor in development work thereof within the aforesaid sixty-day period, stating generally the nature thereof. Said certificate shall be dated and signed by or on behalf of the locator or locators, and verified by them or by some one in their behalf, and when filed for record shall be deemed and considered as prima facie evidence of the facts therein recited. A copy of such certificate of location, certified by the County Recorder, shall be admitted in evidence in all actions or proceedings with the same effect as the original. The performance of such labor shall be deemed a necessary act in completing such location and a part thereof, and no part thereof shall inure to the benefit of any subsequent location."

"Sec. 6. All locations of quartz or placer formations or deposits, hereafter made, which do not conform to the requirements of this Act, in so far as the same are respectively applicable thereto, shall be void."

In the view I take of the present case, it is not necessary to decide to what extent, if at all, this Act, while in force, was applicable to placer claims, or whether, in view of this State legislation, the location under which the defendants assert title is or is not invalid. Assuming that the defendants failed to comply with the provisions of this State legislation, and that such failure operated to open the land to the location of any other competent locator, the fact remains that the defendants continued in the actual possession of the land and continued to mine the same for oil, and that they were so in possession and so engaged on the 26th day of May, 1898, when Frank H. Jackson, for himself and the seven other persons who had theretofore been associated with Wilson, undertook to locate the ground in question under the mining laws. That location, according to the affidavit of Jackson, which was introduced in evidence on behalf of the complainant, was based upon these facts, as constituting his discovery, and nothing else: "That on May 26, 1898, he (Jackson) was on said northeast quarter of said section; that on said date he discovered indications of oil-bearing strata on said quarter section at and near the southeast corner thereof. Said indications were as follows: At the said southeast corner the surface is covered with broken-up formations of sandstone and underneath, less than 1 foot beneath the surface, affiant found the sandstone in place. A few feet east and northerly from said corner a ravine cuts the formation, showing the solid sandstone stratum in place, being the same stratum that underlies the said corner a short distance above said corner in said ravine and about on the west line of Section 20. There is a highly mineralized spring, charged with soda and other salts, such as are almost invariably found in the proximity of oil-bearing sand, and which indicate the oil sand is in the immediate neighborhood. The sandstone referred to has some strata of shale and said sandstone and shale are of the character that usually carry oil in said district, and said shale bears indications of bituminous matter. That on said date he located the said northeast quarter section as a placer mining and oil claim as follows," giving the boundaries. The previous observations upon the subject of discovery dispose of this attempted location by Jackson for himself and his seven associates. It was, as he himself testifies, based merely and solely upon surface indications of oil, which are insufficient to constitute a discovery. It is doubtless true, as will appear from what follows, that Jackson, at the time of the making of his attempted location on May 26, 1898, knew of the actual discovery by the defendants of oil upon the land in question; but it is perfectly plain, from his own affidavit, that he did not base his location upon any such knowledge. It is also true, as a matter of law, that it is not necessary that a locator should be the *first* discoverer of mineral upon the land in order to make a valid location; but he must not only have a knowledge of the former discovery, but such actual discovery must be *adopted and claimed by him* in order to give validity to his location. Jupiter M. Co. vs. Bodie Con. M. Co., 11 Fed. Rep., 666, 676. This, as has been shown, Jackson did not do, but, on the contrary, based his location upon mere surface indications of the existence of oil, which, as has been said, is insufficient to constitute a discovery. Moreover, I think it clear that the attempted location by Jackson, made on the 26th day of May, 1898, was invalid for another reason. The defendants were at that time in the actual possession of the claim in controversy and actually engaged in mining it for oil. It appears from the affidavit of C. A. Canfield (one of the parties interested in the defendant Home Oil Co.)—and this I do not find anywhere contradicted—"that in the month of May, 1898, J. E. Wilson (who, Jackson swears in his affidavit, assisted him in marking the boundaries under the location made by him May 26, 1898,) and Frank H. Jackson came to Oil City and at affiant's invitation stayed at his cabin and where they were entertained as guests; that the morning after they came to affiant's cabin, as aforesaid, affiant saw them engaged in the erection of a monument. He went to them and asked them what they were doing, whereupon said Jackson told him that they were perpetuating the monuments defining the line of Section 17 in said township and range; that affiant thereupon showed them where the south center corners of said Section 17 were, whereupon they moved the rock over to the corner so indicated; that after the said Wilson and Jackson left the said monument the said affiant went and got I. F. Postom, who was then manager of the Home Oil Company, operating on the northeast quarter of Section 20, and he and said Postom tore down said monument to make an examination thereof and to see if they had left any notice of claim of any kind whatever therein, and they found nothing therein, and they thereupon restored said monument; that some time in June, 1897, some person, to affiant unknown, entered upon the said northeast quarter of Section 20, went to the southwest corner thereof and partially erected a derrick; that as soon as said affiant discovered that the derrick was there he went down and made an examination of it and found nobody around or in possession of that portion of said quarter section in connection with said derrick; that affiant says after his first visit there, later in the same day the same or other parties placed or added more to the structure of the said derrick, but without completing it; that thereafter no further work was done by anybody in connection with said derrick, nobody remaining in possession of or claiming it or to the ground in connection therewith, and the next time that the affiant visited that portion of the ground, which was a few weeks later, he found said derrick was down." There are affidavits on behalf of the complainant to the effect that the derrick thus spoken of was built by Wilson and that he completed it at a cost of one hundred dollars, and that it was so built under and pursuant to the location made by Jackson on May 26, 1898 It is true that upon mineral land of the United States, upon which there is no valid existing location, any competent locator may enter, even if it is in the actual possession of another, provided he can do so peaceably and in good faith, in order to initiate a location for himself; but no right upon any Government land, whether mineral or agricultural, which is in the actual possession of another, can be initiated by a forcible, fraudulent, surreptitious or clandestine entry thereon. Such entry must be open and aboveboard and made in good faith. Belk vs. Meagher, 104 U. S , 279; Atherton vs. Fowler, 96 U. S., 513. One who is in the actual possession of a mining claim, working it for the mineral it contains and claiming it under the laws of the United States, whether the location under which he so claims is valid or invalid, cannot be forcibly, surreptitiously, clandestinely or otherwise fraudulently intruded upon or ousted while he is asleep in his cabin or temporarily absent from his claim. I think it is clear from the showing made upon the hearing of this application: first, that Jackson did not make any such open and good faith entry upon the actual possession of the defendants of the quarter section in question, upon which he could invalidate any valid location thereof under the mining laws, and, secondly, that, according to his own affidavit, he made no such discovery of mineral upon the land as the statute requires.

For the reasons stated, I am of the opinion that the complainant is not entitled to the appointment of a receiver herein, irrespective of the question of the validity of the location under which the defendants assert title and irrespective of other questions argued by counsel.

An order will be entered denying the application for the appointment of a receiver.

ROSS, Circuit Judge.

[Endorsed]: No. 855. U. S. Circuit Court, Ninth Circuit, Southern District of California. Nevada Sierra Oil Co., a corporation, substituted for Dewey Mining Co., a corporation, vs. the Home Oil Co., et al. Opinion on Motion for Receiver. Filed Dec. 18, 1899. Wm. M. Van Dyke, Clerk.

Of Interest to Steam Freighters.

Written for the MINING AND SCIENTIFIC PRESS by S. I. HALLETT.

While traveling in the San Luis Park of Colorado, I observed a peculiar condition of roads that might be of interest to any one freighting in a desert region, where the sand is very deep and thick, and particularly of interest to steam freighters, where a good road is really a part of the machinery.

San Luis valley has once been the site of an old lake, and the whole valley, with few exceptions, is very sandy, a loaded wagon sinking from 4 to 10 inches in the coarse sand. The farmers in that section have placed on the roads a covering of from 6 inches to 1 foot of wheat straw. This they cover again with a small amount of sand, and this roadbed makes the finest highway that I have ever traveled over in the country—springy, and yet not allowing a loaded wagon to sink into it at all; perfectly good after a rain or in the driest weather, it enables the farmers to haul three times as much with the same power as though it were not there. The country being very dry, it makes a lasting road, as the wheat straw, after having been plowed under for several years, when brought to light, is as bright and fresh as when it was first covered up, not rotting in the slightest degree.

The difference is very marked the minute that you leave these roads and get into the heavy sand. It is as cheap as anything that could possibly be placed on the road to better it. The country is a large wheat producing one, and such straw as they do not use is burned, owing to the fact that it will not decompose when plowed under in their wheat fields. The straw breaks off in small pieces, being very brittle, and seems to mix with the sand, forming an almost perfect macadam road.

Possibly it might be of benefit to mines using steam wagons to try to better their roads by this means, if they have the wheat straw, or, if not, with the best wild hay at their command. The difference in the ease of travel and the very marked difference in the amount of load that can be hauled strikes one forcibly.

THE New York Auto-Truck Co.'s first truck is completed. The platform of the truck stands about 4 feet from the ground. The steering is done by a wheel in front of the driver's seat. The power and speed are controlled by two levers operated by the driver's feet. The compressed air cylinders are in front of the rear wheels and the driving mechanism is under the body of the truck. The truck weighs eight tons, can carry ten tons, and its speed is nine miles an hour.—Blacksmith and Wheelwright.

MINING SUMMARY.

U. S. Gold and Silver Production in 1899.

The preliminary estimate of the production of gold and silver in the United States during the calendar year 1899, made by Mr. Roberts, the Director of the Mint, shows a total gold production of $70,694,170, an increase over the production of last year of $6,236,670. The production of silver during the year is estimated at $74,424,696, an increase during the year of $4,040,211. The gold production by States for the years 1899 and 1898 is given as follows:

STATES.	1899. VALUE.	1898. VALUE.
Nevada	$ 2,442,000	$ 2,994,500
Washington	306,202	766,200
Oregon	1,550,387	1,177,600
Alaska	4,609,819	2,524,800
California	14,952,392	15,637,900
Idaho	2,480,620	1,716,900
Montana	4,919,897	5,126,900
Utah	3,369,509	2,285,400
Appalachian States	337,344	327,700
Colorado	26,000,000	23,105,300
South Dakota	6,120,000	5,699,700
Arizona	2,500,000	2,465,100
New Mexico	600,000	539,000
Wyoming	6,000	.....
Others	.....	500
Totals	$70,694,170	$64,457,500
British Klondike.	16,114,150	.....

The estimated production of silver during 1899 and 1898 is given as follows:

STATES.	1899. VALUE.	1898. VALUE.
Nevada	$ 1,254,800	$ 1,040,808
Washington	452,525	328,921
Oregon	193,940	168,081
Alaska	258,585	119,467
California	1,396,363	830,448
Idaho	5,171,717	6,560,065
Montana	20,040,130	19,144,663
Utah	9,696,969	8,385,810
Appalachian States	9,057	2,068
Colorado	31,208,637	29,498,958
South Dakota	550,700	196,913
Arizona	3,000,000	2,904,954
New Mexico	600,000	549,833
Texas	600,000	611,426
Others	.....	42,020
Totals	$74,424,696	$70,384,485
British Klondike.	.....	252,000

ALASKA.

Alaska during 1899 doubled its gold product over 1898. The record for 1899 was: Gold $4,917,821, silver $82,680, as compared with an output of gold of $2,517,121 and of silver of $49,152 in 1898. Of the total output of Alaska, $2,408,830 gold and $3935 silver came from the beach and placers of Cape Nome and vicinity.

The Nome Gold Digger, a weekly, printed at Nome, publishes the prices on the bill of fare of the principal restaurant: Tenderloin steak, $3; reindeer steak, $2; ptarmigan, $3; boiled mackerel, $1.50; coffee and doughnuts, 50 cents; corn beef hash, $1; oyster stew, $1.50; hot cakes and syrup, 75 cents; club sausage, $1.50; fried ham, $1; salmon, $1; sardines, per box, $1; three eggs, $2; pies, each 50 cents; loaf bread, 25 cents; toasted cheese, $1. Two-story, seven-room dwellings are advertised in the Gold Digger for rent at $200 per month; wagons and teams for hauling may be had for $10 per hour; a shave cost $1, a haircut $1.50 and a bath $2. A laundry offers to wash flannel shirts at 50 cents each, colored linen at 75 cents and a "white boiled shirt" at $1. Cigars and drinks cost 50 cents each, lumber is $250 a thousand, shingles $7.50 a bunch and wood for fuel $35 to $50 per cord.

ARIZONA.

COCHISE COUNTY.

(Special Correspondence). — It is generally supposed that the mines of Tombstone are worked out. This is a mistake. The population has dwindled from several thousand to a few hundred and the large mines have mostly been shut down, but for the number of people living there there is no more prosperous community in Arizona. Only one or two mines are being worked, and these are above water level. Shipping receipts show that the ore runs 326 ounces silver and 3½ ounces gold per ton. If a syndicate should take all these properties and work them under one management, and reduce the ores on the ground, Tombstone would soon be as large a producer as ever.

The town depends largely upon the outlying tributary camps. The Turquoise district, not far away; the Dragoon mountains, where the Hardy syndicate of Chicago has opened up a shipping copper proposition; the Pearce gold mine, which has produced several millions; the Huachucas, where the Exposed Reef M. Co. of Akron, Ohio, headed by P. J. Boucher, are opening a large body of gold-bearing quartz which will average $8.33 per ton, and to reduce which a 40-stamp mill has been ordered; and other districts within a radius of thirty miles make business for Tombstone.

Bisbee is one of the best copper camps in the Territory and contains a population of about 6000. There is not a Chinaman in it. Vagrants are given a half hour to leave town. Wages are $3.50 to $4, and the cost of living high. The town is not incorporated, but has a good water system, owned by E. B. Mason and associates. There is a handsome schoolhouse, given by the Copper Queen Co. and largely supported by it; a library, with a large hall overhead, also a gift to the town by the same company.

The first furnace for the reduction of copper ores in the district was constructed in 1880, and had a capacity of forty tons per day. This has grown, until now the capacity is 800 tons per day. Just now the furnaces are shut down for a period of five or six weeks for the purpose of repairs and the putting in of electric cranes to handle the molten metal. It is stated that about fifty tons of copper bullion are produced daily. The deepest shaft on the property is not more than 600 feet—and there are forty miles of tunnels, drifts and crosscuts. The company owns and operates the Arizona & Southeastern Railroad, which connects Bisbee with the Southern Pacific system at Benson. It is stated that ore bodies have been opened which insure an output at the present rate for twenty years.

The credit for the success of this enterprise is largely due to Messrs. Ben and Lewis Williams, who have been superseded by Walter Douglas, the Williams brothers going to California, it is said to take charge of a large mining proposition in that State.

Other copper properties adjacent to the Copper Queen are being opened, among them the Lowell & Arizona Co.'s property of Boston, Fred. Fenner Supt. A shaft 400 feet deep, besides drifts at the 100, 200 and 300 levels, in ore, have been run on the property during the past eight months.

Bisbee is also coming to the front as a gold producer. The Easter Sunday G. M. & M. Co. is operating a gold property of four claims in the Warren mining district, four miles east of Bisbee. They have sunk a shaft 115 feet, in sinking which they sacked twelve tons of ore, samples from which gave returns of $194 gold, three ounces silver and 2% copper. Three hundred tons of second-class ore on the dump runs $15 per ton. A tunnel is now being driven to tap the ledge at a depth of 225 feet and is in 174 feet. This company is an Arizona corporation, organized under the laws of this Territory. It is owned by ten men.

Benson is the shipping point for outlying mining camps situated in the Whetstones, Dragoons, Chiricahuas and Rincons.

Within a mile of Dragoon station, on the Southern Pacific, is the property of the Dixie M. Co., a copper proposition, incorporated under the laws of the Territory. It consists of ten claims and has over 500 feet of development. Besides copper, it carries gold and silver values. This is owned by Louisiana capitalists and is being developed under the supervision of its president, R. R. Harper, aided by Vice-President F. S. Webster of Benson. The wages paid are $3.50 per day. After the 1st of January a gasoline hoist is contemplated, which will permit the employment of a larger force.

In the Rincon mountains M. F. Castaneda of Benson and his associates are opening a copper property of nine claims, which is in shipping condition.

In the Whetstone mountains, eight miles from Benson, Mr. Castaneda is the owner of a fireclay property, the product of which is being used by the Copper Queen Co. at Bisbee in the furnaces and converters. Formerly the Copper Queen Co. were obliged to obtain fireclay from Iowa.

Tombstone, Dec. 28th, '99.

GRAHAM COUNTY.

The Helvetia is reported to be turning out nearly 100,000 pounds of copper daily, running two-thirds of its capacity. It is also said large bodies of sulphide ores have been developed, and the end of the crosscut has not yet been reached. A second jacket will be installed. Three hundred men are employed.

CALIFORNIA.

Superintendent Leach and Statistician Yale of the United States Mint in San Francisco have prepared a preliminary statement, based on receipts at the United States Mint and other bullion depositories on this coast, showing that California produced in 1899 gold to the amount of $15,000,000, and silver $636,000.

AMADOR COUNTY.

Good ore is being taken from the South Eureka mine, near Sutter Creek. The mill is an electric plant.

At the Amador Queen mine, between Jackson and Middle Bar, a sump is being sunk at the 1200-foot level prior to drifting. Supt. Dye reports that the company has been reorganized.

It is reported that a better grade of coal than ever heretofore found has been opened in the No. 3 mine near Carbondale. It is lignite.

C. E. Purrington, superintendent of the Gover mine, north of Amador City, reports the shaft on the Fremont property of the Gover Co. down 40 feet; that the hoist is finished and one shift is working in the shaft. After Jan. 1 three shifts are to be put on.

Sinking has been stopped in the new shaft at the Oneida mine at a depth of 2100 feet, where a station will be cut and a crosscut run to the vein. The old shaft has been unwatered to a depth of 600 feet.

Jackson Dispatch: At the Mutual mine, between Sutter Creek and Amador City, the buildings over the engine and hoist are up and the shaft is down over 260 feet. New and heavier machinery that will sink to 3000 feet is to be put in. The quartz in the shaft is looking well.

To the Oneida 60-stamp mill will be added a compressor with a capacity of thirty drills. The water in the old shaft is down and the shaft repaired to 500 feet. The new shaft is down 2080 feet. Sinking has temporarily ceased. A level is to be opened at 1200 feet.

Amador Record: At the Lincoln mine at Sutter Creek the sinking of the shaft has been completed to 1263 feet and a chute and station are being cut out at the 1200 level. Power drills will be installed. On the 500 level they are drifting on the west vein recently encountered. The ore body at that point is not large, but good milling ore. In the west crosscut that was driven at the 500 two new ore bodies were encountered, the first 135 feet west of the main ore body and worked by the former company. The footwall ore body was 70 feet farther west, making it 205 feet west of the main east ore channel.

Rock from the ledge on the 1350-foot level of the Central Eureka milled at the Zeille mill it is estimated will yield $10 in free gold and the sulphurets $150 per ton. This rock is not from what is known as the rich lead.

BUTTE COUNTY.

Oroville Register: It is reported that the owners of the Magalia mine, Rideout & Haggin, have made a proposition to the owners of other mining land in the vicinity to run a drain tunnel, so that all the mines could be worked by means of this tunnel. If the other mine owners are willing to have this done, and give a certain amount of land or stock in exchange for the tunnel, then one of the best mining districts in the State would be opened and hundreds of men would be employed. Four years ago this property was examined by J. O. Rusby, at request of the owners, who reported that at an expense of $150,000 a drain tunnel could be run that would place the mine in a position to be worked at less expense. W. R. Eckart also examined the mine at the instance of the owners and he gave a similar opinion.

CALAVERAS COUNTY.

Calaveras Chronicle: In excavating for the engine room at the Emerson mine, near Mokelumne Hill, a parallel ledge was found, 60 feet west of the shaft, the ore having the same characteristics as the Moser ledge; a third ledge was encountered, which looks well, and both leads show an average width of 5 feet.

EL DORADO COUNTY.

At the Schneider mine, in Mud Springs district, Bryant & Hill have struck rich ore. Their tunnel is in 750 feet, and the ledge is 3 feet wide, showing free gold.

Eighteen men are employed at the Strahle slate quarry in Kelsey district.

NEVADA COUNTY.

F. Zeitler of the Champion mine, of Nevada City, has bought from Towle Bros. Co. 18,000 acres of land lying between Emigrant Gap and the town of Washington. The tract includes the line of the Towle Co.'s narrow gauge railroad. The lumber has been cut from most of it, but there are thousands of acres of it covered with mining timbers, poles and fuel. Large gold-bearing quartz and gravel deposits exist within its boundaries.

The Azalea drift mine of Placer county has been closed for the winter. During the past nine months the tunnel was extended 1076 feet, giving a total length of 2256 feet. It is expected that the channel will be reached in 750 feet.

The North Bloomfield mine, at one time the largest hydraulic mine in the State, is now being operated by the drift method.

Penrose & Harker are putting in a restraining dam at Relief hill, preparatory to hydraulicking under permit from the Debris Commission.

Nevada City Herald: The Crescent and Kate Hays mining claims, near the Pennsylvania and W. Y. O. D. mines at Grass Valley, have been sold to I. Haas for $20,000. The Kate Hays has produced nearly $100,000, but has not been worked since the early '60s. It has not been determined what disposition will be made of the property.

PLACER COUNTY.

The Big Gun hydraulic mine, at Michigan Bluff, is working with a good head of water, but progress is slow, as the top ground slides into the pit.

The lower tunnel of the Eureka drift mine, six miles northeast of Sunny South, is in 3276 feet and is in a blue lead. The upper lead, which is 200 feet higher, is of grayish color.

At the Jupiter, it is reported, $3000 was taken out during December.

Thirty-five men are working at the Gold Blossom, near Ophir. They are opening up the lode at the 400 level.

PLUMAS COUNTY.

The Four Hills mine, situated close to the line between Plumas and Sierra counties, and six miles south of Johnsville, is owned by Moody, Grant and others of San Francisco. It is at an altitude of 7400 feet. By means of two tunnels, the mine is being opened and a large body of ore is exposed. H. E. Averill is Supt. of the mine. In spring the mine will be operated with a large force. The crushing of ore will begin in the old mill this month.

RIVERSIDE COUNTY.

A run of thirty tons of ore from the O. K. mine, in Virginia Dale district, fifty miles northeast of Walters Station, milled $800 in the company's mill. The mine is down 250 feet, with several hundred feet of levels.

The lepidolite mines near Pala are shipping 2500 tons of that mineral to New York. It is reported that it is worth $25 per ton at the mine. Lepidolite is lithia mica of variable composition, containing usually aluminum, iron manganese, potassium, sodium, silicate, etc., and is chiefly valuable for the lithia. It is a beautiful micaceous (scaly) mineral, ranging in color from silver gray to violet, rose red, yellowish and white. It is from fine granular, the scales being arranged in groups, to coarse in texture. It is soft and easily scratched by the finger nail. It is usually associated with tourmaline, and the Pala deposit is no exception, containing a quantity of pink tourmaline (rubellite) arranged in groups of radiated crystals.

SAN DIEGO COUNTY.

San Diego Union: A find of copper ore was made some time ago on the Daley ranch, at San Vicente. At the time of the find the ranch was involved in litigation, but the suit has since been settled. T. J. Daley of San Diego is the owner. The width of the ledge is 23 feet. Assays show that the ore contains 8% copper, 11 ounces silver and $2.10 gold to the ton. A shaft is being sunk.——Twenty-five men are at work on the Owens mine at Julian. ——A rich lead has been struck in the old Cravath mine at Escondido. The ledge is 19 inches thick and is reported rich in gold.——The lessees of the Escondido mine milled thirty-five tons of rock recently and cleared over $1100, the work of four men for twenty-six days.

SANTA BARBARA CONUTY.

At Summerland, where oil is being pumped from under the sea, the most easterly well on the beach is reported, at a depth of 400 feet, to have developed into a gusher, flowing seventy-five barrels the first day.

SANTA CLARA COUNTY.

The Silver Creek M. Co. is developing an old quicksilver mine on Silver creek. Thirty years ago the mine was worked and it is said that nearly $300,000 worth of quicksilver was mined. A new smelter is projected.

The Silver Creek M. Co., which was recently organized at San Jose, has commenced the development of the old Quicksilver mine, on Silver creek. Thirty years ago the mine was worked and rude furnaces built and considerable quicksilver produced. The ore occurs in sandstone near a serpentine contact, with the geological conditions similar to those found at the large quicksilver mines.

SHASTA COUNTY.

(Special Correspondence.)—In the Bowery Belle mine, owned by Kahny & Burgbacher, near Shasta, a contract has been let for an additional 100 feet of tunnel. The present length of the tunnel is 385 feet, on a ledge from 4 to 30 feet wide, of fair-grade ore.

D. McCarthy of Taylor has leased the old Minnesota mine, near Copley, and has put men at work to open the old works.

Panter & Litsch last week opened a new ore body in the Evening Star mine, in

Old Diggings, that is 12 inches wide and assays over $1000 per ton.

Work has been resumed at the Mount Shasta mine, under the superintendency of W. G. Scott. A new ore body of high grade was discovered in this property last week.

Machinery is being placed on the Black Spider mine, near Keswick, by a San Francisco company, preparatory to unwatering the shaft.

On the Bennington group, near Iron mountain, work began last week sinking a winze from the old Nellie tunnel. This property was recently secured by O. E. Williams of Ukiah and C. F. Bunker of San Francisco. The property comprises nine claims, and has not been operated for eight years.

Redding, Jan. 1st, '00.

SISKIYOU COUNTY.

Yreka Journal: Prospects of gold quartz have been discovered at Sheep Rock, Shasta valley, north of Mt. Shasta, and a number of men from Edgewood have gone there.——Supt. Brokaw of the Quartz valley hydraulic mines is running the giants with a full supply of water.——The Yreka Creek Dredger Co. has started work on the construction of the dredger at Hawkinsville.——The new copper ledge on Dutch creek, six miles from Klamath river, in the Virginia Bar district, is showing good ore.——The cold weather of the past week has checked mining to some extent by freezing the water supply of small streams at the head of same in the high mountains.

Several claims have been located in the Black Buttes, near Sheep Rock, where prospects of gold and copper have been discovered.

Work has been resumed at the Sheba quartz mine and mill on Patterson creek this week with a full force. An air compressor and other modern apparatus have been added.

TUOLUMNE COUNTY.

The Spring Gulch mine, owned by R. Marshall, and located five miles southeast of Carters, has been taken under bond and work will begin on the mine early in 1900. The shaft is 500 feet deep.

The 5-stamp mill building on the Free Lance mine, situated on Berger's ranch, twelve miles southeast of Sonora, is nearing completion.

Ore is being stoped in the east and west drifts on the 300-foot level of the Hope mine, at Sonora. The vein is 28 inches wide, carrying free gold and a small percentage of high-grade sulphurets. Fifty tons of the ore is being hauled to the Bonanza mill for treatment. The last run on seventy-five tons yielded $25 per ton in free gold and the sulphurets were rich.

The main shaft of the Little Wonder mine at Big Oak Flat is down 150 feet and crosscutting is in progress. The vein is 4 feet wide and mills $8 per ton. A rich shoot has been found on the hanging wall side by crosscutting. A 10-stamp mill is to be built.

At Tuttletown the Street mine is being developed, and a strike is reported on the 200 level. The vein is 12 feet wide and contains high-grade ore.

The north extension of the Mount Jefferson, at Groveland, is being opened. A vertical shaft will be sunk in the hanging wall to the vein.

The Bodie, Cal., company which has been operating the Excelsior claim, above Confidence, will remove the machinery from that mine to the Hazel mine, seven miles north of Soulsbyville.

Sinking is to be resumed on the Bown mine, near Robinson's Ferry.

It is reported that arrangements are being made to resume work on the Genevieve mine, a mile west of Soulsbyville. The hoist at this mine, when operating, is run by compressed air furnished by the Black Oak Co. The pipe line is 4000 feet long and 2 inches in diameter. The air is heated at the Genevieve by means of a small fire on the grate of the boiler, which is used as an air receiver. It is stated that the effective pressure is thus rendered higher at the Genevieve than when it leaves the compressor at the Black Oak.

The new ore shoot recently discovered in the Black Oak mine, near Soulsbyville, is entirely distinct from that worked heretofore. The discovery was made in the lower levels and is supposed to afford several hundred feet of backs.

COLORADO.

The following estimate is given of the mineral yield of the State in 1899:

Gold	$31,329,056
Silver	12,680,256
Copper	1,854,226
Lead	4,461,259
Zinc and manganiferous iron	557,500
Stone and marble	1,825,000
Iron and steel	7,681,719
Coal	8,750,000
Oil	1,500,000
Total	$70,139,016

BOULDER COUNTY.

It is estimated that the gold output of Boulder county mines for 1899 will reach $1,000,000.

Another smelter for this county is under consideration by Eastern people.

John Wright of the Mountain View mine, near Ward, has bought the Rainbow group of six claims adjoining the San Blas mine.

The Pennsylvania mine at Sunnyside is being unwatered and drifts are to be run from the 200 and 300 levels.

A recent shipment from a large vein in the bottom of the Melvina shaft in the Magnolia district ran $361 to the ton.

The mining town of Caribou was almost totally destroyed by fire last week.

CLEAR CREEK COUNTY.

Idaho Springs Gazette: The mines around Georgetown and Silver Plume, which have been worked since the drop in silver, have made a regular production the past year. The Pelican-Dives and others of the group operated by J. H. Robeson give employment to a large force. New ore bodies have been opened, and at the Stevens group the levels are coming into high grade mineral, none of which can be moved until the snow has disappeared.

DOLORES COUNTY.

The 100-ton concentrating mill at Rico started up on the 30th ult. Construction was commenced in August. It cost $30,000.

GILPIN COUNTY.

Work has been commenced on the new shaft house of the California mine; it will be 110x100 feet.

The Modoc has opened up a good body of copper sulphide ore in the breast of the east drift, 300 feet from the shaft.

The Robert Emmet is running six air drills on ore and keeping twenty stamps in operation.

Mgr. Johnson of the Lotus mine, in Russell gulch, has 300 tons of ore, which will be treated at the concentrating plants at Idaho Springs.

LAKE COUNTY.

A 4-foot stratum of high-grade sand carbonate has been found in the Penrose mine at Leadville. This ore occurs in a large mass of low-grade ore. Assays show 332 ounces silver and 25% lead. A drift from the Midas is approaching Penrose workings, and one from the latter is headed toward the Midas. They are separated by a vertical distance of 23 feet and will be connected by a raise. All the ore shipped from the Penrose is from development work, no stoping being done on the large ore body discovered early last fall. The main drift has penetrated it 300 feet. Near the northeast end an upraise was recently completed of 35 feet and the top was not reached. The daily production is 200 tons and 100 men are employed. Three classes of ore are shipped: the fluxing iron, the argentiferous iron and the high-grade lead carbonates.

Leadville mines are swamping the railroads and smelters with ore. The yards of both are crowded with cars loaded with ore of all kinds, and the rolling stock of the railroads is taxed to its utmost to get the ore to the local, Denver or Pueblo smelters.

During 1899 the Fanny Rawlings of Leadville made a gross output of $350,000, the ore being the best average grade in the camp, some of it including 7% to 9% copper, besides the gold and silver values. The mine has a good equipment for deep mining and will in 1900 duplicate its output of 1899. It was opened under the management of J. F. Walsh.

Leadville Miner: The new shaft of the Evening Star, on the Morning & Evening Star Con., is in ore. In the drift from the 130-foot level, in the first contact, a 6-foot face of mineral has been broken into, nearly solid lead carbonates, assaying 20% to 30% lead and fifty to eighty ounces silver, making an ore worth from $50 to $75 per ton. Lessees McGowan & Co. expect to commence shipping after New Year's. The ore is an extension of the shoot worked by Collins & Co. in the Kitchen shaft. On the Morning & Evening Star Con. ground are thirteen shafts, going by lessees, from 700 feet up. It has been one of the most regular of fluxing and steel-iron producers.

MINERAL COUNTY.

It is reported that a new mill is to be built at Creede. Options on the ground have been secured or purchased. The site of the new plant will be at the forks of Willow creek. The mill is to be erected by owners of the large dumps in the camp. The mill is to have a capacity of 400 tons of ore per day. The mill dump on the United mines was profitably worked by the Creede Co-operative Co., who erected a mill of 100 tons capacity over a year ago, and since then that dump has been worked at a good profit.

OURAY COUNTY.

The Herald estimates the output of the county as $2,250,000 gold, $910,076 silver, $121,922 lead and $127,321 copper, making a total of $3,409,319. Last year the gold output was estimated at a little more than $800,000.

The improvements in mines and mills in the county during the past year have amounted to $300,000.

An addition of twenty stamps will be made to the Camp Bird mill, the American Nettie will erect a 10-stamp mill, and the Atlas a 10-stamp mill during 1900.

The management of the Saratoga group, at Ironton, will erect a smelter in the spring of sufficient capacity to treat its own ores and do custom work.

PARK COUNTY.

An addition has been made to the machinery plant of the Brownlaw mine.

A strike of $50 ore is reported in the Bessie mine on Cover mountain, Freshwater district.

PITKIN COUNTY.

The Keystone mine, joining the La Salle at Aspen, has been leased and will be worked.

The La Salle mine, now being operated under the management of G. S. Newman, contains a large body of good grade silver-lead ore. The Keystone claim adjoins the La Salle and the latter's contact extends into the Keystone property and is the main Aspen contact. There is another contact crossing the Keystone. Both of these can be traced on the surface. They are near together in the Keystone and converge on their dip, forming a junction at depth. Development work has been commenced by the lessees on the Keystone and a steam hoist is being erected.

SAN JUAN COUNTY.

The Tiger mine at Silverton is working thirty men.

A. Jackson is finding rich gray copper in his City View claim on Anvil mountain. The ore occurs in pockets.

W. Neff has a carload of ore broken from his Dewey claim, Cement creek. The vein from wall to wall measures 4 feet and for the greater part is said to be in ore.

P. S. Rider, Supt. of the Enterprise mine at Rico, and also agent for the Silverton M. Co., owners of the North Star property on Sultan mountain, states that work is to be resumed on the Star mine.

SUMMIT COUNTY.

The Augusta M. Co. has let a contract for driving a 350-foot tunnel on the Juventa group from 100 to 500 feet deep.

The two-compartment shaft of the Blue River Gold Excavating Co. has reached bedrock and a sump cut in the bottom. A drift is to be run 75 feet to the point where the excavator pit will be located.

C. A. Finding will prospect with a diamond drill from the bottom of his 300-foot shaft on Shock hill to discover whether or not blanket veins exist below the sulphide contact cut by the shaft.

TELLER COUNTY.

The strike recently made in the Mackin lease of Orpha May No. 2 is proving a bonanza. A forty-ton shipment returned 628 ounces fine gold. The old shaft was down 350 feet, where a good vein was disclosed, but several hundred feet of drifting done upon it failed to find ore. Mgr. Mackin decided to sink the shaft another lift to see if with additional depth values would be found. Hundreds of feet of drifting at the level above failed to find a pound of pay ore. Before 4 feet of sinking had been completed low values were encountered, but at every shot it improved and has been improving since. The shipment mentioned was comprised of ore saved in sinking.

In the case of the Roxana M. Co. vs. Doctor M. Co., of Cripple Creek, Judge Hallett of the United States Circuit Court, at Denver, last week decided in favor of defendant company. It was an apex case, the Doctor having the apex and claiming the extralateral right, which was denied by the Roxana Co., which sought to enjoin the Doctor Co. and a lessee, J. Winchester.

The Uncle Sam mine of the Blanche G. M. Co., at Cripple Creek, is shipping. Ore was found last week 54 feet from the surface, and the vein is large, exceeding 12 feet. Samples show three ounces gold to the ton. A carload will be shipped daily.

A recent shipment of 27½ tons of ore from the Isabella mine, at Cripple Creek, is reported to have yielded $219,090.92 net. The total amount of ore in the shipment was 360 tons, 144 tons of which was Isabella ore, the balance being from the Independence and Ajax mines. The total gold in the ore amounted to 13,000 ounces, and the silver to 1000 ounces. The net value of the ore was $253,460.30, of which amount the Isabella received the sum of $219,090.92. The shipment was the largest ever sent from the district at one time.

The Woods Investment Co. intend running a tunnel from their property at Victor under the Cripple Creek district, terminating under the town of Cameron, on the east side of the district, a distance of 14,000 feet. The cost will be about $275,000. The tunnel will be for transportation. The big tunnel is in 300 feet. After March 1st, when the Gold Coin mine has its air compressor plant in place, work will be expedited by the use of power drills driven by air furnished by the plant. This tunnel will tap the properties of the Battle Mountain Con. at a depth of 640 feet, the Deadwood at 936 feet, the Wildhorse at 1034 feet and the Damon at 730 feet. The tunnel will end under the town site of Cameron at a depth of 420 feet.

A 300-foot contract has been let by the New England & Cripple Creek G. M. Co., sinking in the shaft to open the Grand View and New Bedford claims on Straub mountain. A shaft house has been completed on the New Bedford. A gasoline hoist will be installed.

A strike is reported on the Columbia claim of the Cripple Creek Columbia Co. on Beacon hill, adjoining the El Paso, at a depth of 300 feet and 25 feet from the shaft. There are 2 feet of ore worth $35 a ton in car lots. In the center of this there are 10 inches of rich ore. The lessees will sink another 100 feet.

The Modoc is shipping a carload a day of ore carrying from three to seven ounces. Machine drills are in use on development.

IDAHO.

An estimate of the mineral production of Idaho for 1899 gives the following results: Gold, $2,500,000; silver, $6,103,000; lead, $4,960,410; copper, $60,000.

ADA COUNTY.

Reports of rich strikes come from the Miller mountain district, discovered last year, northeast of Boise City. It is said in one claim, the Magnolia, a 3-foot vein of ore runs $600 in gold.

IDAHO COUNTY.

In the Spokane-Buffalo Hump Co.'s property at Buffalo 9 feet of $25 gold ore is reported.

OWYHEE COUNTY.

(Special Correspondence.)—The Cumberland is one of the mines that closed down in this section when the Bank of California failed in September, 1875. Recently the district took on new life and considerable development work goes on. A new combination mill is being built at the Cumberland, on old War Eagle mountain. A 7000-foot tunnel is being run to drain the old workings and tap the ledges at lower depth. This district will be heard from in 1900.

Silver City, Dec. 31st, '99.

SHOSHONE COUNTY.

A report from the Charles Dickens is that the crosscut being run preparatory to sinking the new double compartment shaft has cut 10 feet of ore. A mill is in contemplation, as it is evident that with a small one the development work would pay its own running expenses.

The lower crosscut tunnel on the Leslie Copper M. Co.'s property has cut the vein, but instead of finding copper ore the ledge was filled with galena. In the upper works, 1000 feet farther west, there was good copper ore.

Spokesman-Review: Owing to the labor troubles in the Cœur d'Alenes, which culminated in the riot and destruction of the Bunker Hill & Sullivan concentrator, the output of the district will fall somewhat below that of last year, the product prior to April 29 having exceeded that of the same period last year, while since order was restored throughout the district each of the producing mines has materially increased its yield. The most marked increase is that of the Bunker Hill & Sullivan, which is turning out 1000 tons of ore daily, whereas the capacity of the old mill was only 700 tons. The total yield of the year is estimated at from 90,000 to 100,000 tons of shipping ore or concentrates sent to the smelters, as compared with 112,500 tons in 1898. There will be no material change in the grade of the ore shipped, although the opening of new bodies in the Last Chance, which run higher in silver and yield some copper, has probably caused a slight increase in the yield per ton. The Bunker Hill & Sullivan has also increased the comparative value of its ore slightly.

MICHIGAN.

HOUGHTON COUNTY.

New openings at the Isle Royale are showing well. The lode resembles the Quincy by being bunchy and rich. By carrying out its present policy of creating extensive openings the Isle Royale is preparing to become a large and steady producer. The hoist for No. 1 shaft has arrived. No. 2 hoist will arrive in January.

The Tamarack Co. has let the contract for the construction of the rock and shaft house for its No. 5 shaft, to be finished in September, 1900. This shaft will go into commission as a regular producer in 1901. It was commenced four years ago and will strike lode next fall at a depth of 4600

feet. No. 5 promises to be one of the greatest producing shafts in the district. To the east and in front of it the Calumet & Hecla found the lode very rich in its Red Jacket shaft. The conglomerate in this territory has been the richest upon the Calumet property and has been continuous from the surface in No. 4 shaft.

OUTANAGAN COUNTY.

The Mountain iron mine, on the Mesaba range, has finished a shipping season that broke all previous records for a single year's shipment from any iron mine. The shipments amounted to 1,139,000 tons of ore. The Fayal, on the Mesabra range, is the only other mine that shipped over 1,000,000 tons this year. Minnesota's total for the year was 8,368,034 tons, against 5,874,258 last year.

MISSOURI.

The following is given by the State Mine Inspector as the depth of mining shafts in the Missouri zinc fields:

Twenty-six per cent of all shafts operated were between 20 and 30 feet in depth.

Fifty-three per cent were between 100 and 150 feet.

Twenty-one per cent were between 150 and 225 feet.

The average depth of all shafts operated in the country is practically 120 feet.

MONTANA.

SILVER BOW COUNTY.

Alex Tarbet of Salt Lake is reported to have bought the Thomas claim in Butte for $31,000. The claim lies west of Alaska street, on Granite, and takes in the county courthouse. Very little surface ground belongs to the claim, all having been sold for town lots. The former owners, however, have claimed title to an alley running along the rear of two lots adjoining the courthouse, and upon that they have been sinking a shaft, but some time ago they were enjoined by the District Court because of damage done to the building by blasting.

Anaconda Standard: A suit for $600,000 damages has been brought in the District Court by the Boston & Montana M. Co. against the Montana Ore Purchasing Co. for ore taken out of that portion of the Pennsylvania claim which is involved in the suit which Judge Clancy recently decided in favor of the Montana Ore Purchasing Co. The new suit is a revival of a case which had originally been brought in the United States court, but was dismissed there. The complaint in the case alleges that the defendant entered upon the ground by means of underground workings and removed 150,000 tons of ore, valued at $600,000, between April 1, 1895, and April 6, 1898. It is alleged that the plaintiff did not discover the trespass until December 1, 1896. It has been stated that the decision of Judge Clancy did not give the Montana Ore Purchasing Co. the right to mine the property, because there is in force an injunction against the company, issued by the Supreme Court in another case. For several days notices have been published by both the Boston & Montana and Butte & Boston companies offering rewards of $2500 for information leading to the arrest and conviction of parties guilty of stealing or removing ore from either the Pennsylvania or Michael Davitt mines. The notices are the result of a discovery that some one has been stealthily taking out a large amount of the richest ore from both mines in those portions upon which injunctions have been issued. Recently a visit was made to the Pennsylvania mine by a representative of the Boston & Montana and seventy-five sacks of ore, running 30% and 40% copper, were found ready to be removed.

Butte Miner: During the past year the equipment of the Butte mines has kept pace with their development. Heavier and larger machinery has been installed at many mines, and engines capable of developing to a depth of 4000 feet have been placed in position. Several new steel gallows-frames have been erected, one at the High Ore, one at the Diamond and another at the Stewart. The managers of the big mines are planning to dispense entirely with the shafthouses, in order to guard against fire.

Another new feature in the Butte mines is a combination skip and cage, which works successfully. In some cases double-deck cages are used, sometimes with the skip on top and sometimes with the skip below. The former are used where the dump chute is above the collar of the shaft, and the latter where the dump is below the collar of the shaft. These skips have a capacity of eight tons each. The Boston & Montana and Parrot companies are contemplating putting in position new steel gallows-frames and skips.

Butte mining men are giving attention to ventilation, as many of the Butte mines have attained such a depth that the natural mode of ventilation will in the near future be found inadequate. A number of the big mines are connected, the air from one mine passing to the other, but this method of ventilation being no longer satisfactory mine managers are planning separate air shafts with fans on the surface.

The flashlight system of signaling is now in use in all the mines of the district.

Horses are used in nearly all the large mines of the district and are stabled underground.

NEVADA.

The gold production of Nevada in 1899 is estimated at $2,442,000, a falling off of $500,000 from the figure of the preceding year. The silver output partially makes up the deficiency, with a gain of $250,000, the estimated production being $1,254,800. The yield of lead and antimony is greater than for any previous year.

EUREKA COUNTY.

Eureka Sentinel: Men are at work in the Eureka Con. mine clearing out the seventh level and the incline from the ninth level some distance down. Work in both places will open up good ground in parts of the mine where no work has been done for many years. All the work done in this mine recently, in the way of opening up ground, has resulted in improving the output and prospects of the mine.

OREGON.

The output of gold for southern and eastern Oregon for 1899 is estimated at $3,285,000.

UNION COUNTY.

(Special Correspondence).—Mining property has advanced since the recent strike in the Brian mine, which sold at $30,000 cash. It is claimed that there is $200,000 in sight.

An explosion of giant powder took place at the Robert Emmet mine to-day; damage light; cause, thawing the powder at the stove. There were several boxes in the room at the time but only four sticks exploded.

The Union-Companion 20-stamp mill and thirty odd mines, the property of J. H. Searles of New York, is under bond at $750,000 and is being developed by a force of sixty men.

Cornucopia, Jan. 1.

UTAH.

The total mineral product of Utah for 1899 is estimated to be: Copper, 9,968,000 pounds; lead, unrefined, 90,062,000 pounds; fine silver, 7,736,248 ounces; fine gold, 173,266 ounces. Total valuation, $12,025,540.

Utah mines paid $1,934,750 in dividends in 1899. There are eighteen dividend payers which have paid an aggregate of over $33,000,000 in dividends since the organization of the companies. About 300 new mining companies were incorporated in Utah during the year, with an aggregate capitalization of over $100,000,000.

JUAB COUNTY.

The Centennial-Eureka, of Tintic distaict, is reported leading the shipping mines of that district in output of ore. They shipped twenty cars the last week of December.

SALT LAKE COUNTY.

Salt Lake Tribune: The receipts of dust from the cyanide mills at the gold sampling rooms of the Con. Kansas City Smelting & Refining Co. during the year 1899 reached a total of 100,000 pounds, of the value of $1,713,600. From this volume of dust there was obtained 100,000 ounces of silver, of the value of $60,000, and 80,000 ounces of gold, of the value of $1,653,600.——Of the total receipts Mercur, Sunshine, West Dip and Lion Hill, in what is known as Mercur district, produced 85,000 pounds of dust, containing 60,000 ounces silver, valued at $36,000, and 65,000 ounces gold, of the value of $1,343,550, with a total of $1,379,550. In this total is included the output of the Golden Gate or De La Mar's Mercur mines for but seven months in 1899, the product during the remainder of the year having been reduced to bullion at the owner's independent refinery and gone into the volume of gold at large.

TOOELE COUNTY.

At J. R. De La Mar's Mercur mines, consisting of the Golden Gate group and others at Mercur, during the year four tanks were added to the leaching department, increasing the set to a total of twenty-six, each with a capacity of 225 tons, or a total of 6600 tons per month. During the same period three new furnaces have been added to the roasting plant. The refinery has undergone a complete change, the new method of refining introduced by Mr. Jackling overcoming all danger. This has been in operation since last July and has given satisfaction. In the mine there has been a large amount of development under Duncan McVichie, general superintendent, so that at this time it can furnish 1000 tons of ore daily. The output is through a shaft and incline combined. For 300 feet the shaft is vertical, then from its bottom to the point at which the incline begins. This shaft and incline is divided into three compartments, in two of which "skips," with a capacity of three tons each, are run in balance. The third compartment is used to handle timber and other supplies and as an exit for the men. The mine is operated on two shifts of eight hours each, and in sixteen hours over 1100 tons of ore have been raised to the surface.

The old Dragon iron mine is now operated and known as the Tintic iron. During the past year shipments were made aggregating 16,000 tons. The ore averages 51% iron excess, and mostly all of it has been used by the local smelters for flux. Several shipments were made outside of the State for the same purpose. The property has been bonded to Thomas Weir, and the latter part of May he began grading a road and getting ready to sink a shaft. The iron ore is taken from open quarries, which have reached over 100 feet in depth and have an area of over 100 by 200 feet. The shaft was started some distance from this quarry, and crosscuts will run from the shaft under the old works. This mine has been yielding an average of 10,000 tons of fluxing material for the past score of years or more.

SOUTH DAKOTA.

CUSTER COUNTY.

Another strike is reported in the Holy Terror mine near Keystone. With a 6-inch vein to commence with at the surface, whose average value was $29 in gold to the ton, it has grown to a 12-foot ledge, with an average value of $35 to the ton.

LAWRENCE COUNTY.

The Golden Reward Co., at Deadwood, are to add a refinery to their extensive plant—the Deadwood & Delaware Smelter, recently bought by them. The Oro Fino mine, in Strawberry gulch, which produces auriferous iron-sulphide ores, is to be reopened, and the Golden Reward Co. will develop their properties in Bear Butte and South Ruby districts. The Golden Reward Co. is now the second largest concern operating in the Black Hills, the Homestake Co. taking the lead.

WASHINGTON.

One hundred and seventy-one sacks of ore concentrates were brought to Tacoma this week from the mines near Singapore, in the straits settlement, for treatment in the Tacoma smelter, the first shipment of ore from the Orient to an American smelter. The product of these mines has been sent to England and this is a trial order.

STEVENS COUNTY.

(Special Correspondence).—A strike in the Lone Pine, of the Lone Pine-Surprise Con. Co., a north and south ledge, 5 to 8 feet wide, average value $22.48 so far as explored, is in soft milk-white quartz, and unlike any ledge in the vicinity. It was on this ledge that the high surface values were obtained two years ago, ranging $60 to $300.

The ledge of blue quartz crosscut by the drift from the 200-foot level on the Chico is of low grade where cut, but of fine appearance. Mgr. Aspinwall has gone to San Francisco to get a compressor plant to drift on the ledge.

There is a strike in the Belcher property, twelve miles east of Republic Camp, the winze sunk near the face of the tunnel at a depth of 85 feet, cutting into 4 feet of copper-gold ore.

Considerable work is starting lately on several different properties on Bridge creek on the south half of the reservation.

The Republic mine paid its thirteenth dividend of 1c per share last month, making a total of $565,000. While the old mill is being run experimentally ore shipments are being made to Trail Smelter, via Grand Forks, the wagon haul now being 30 miles.

Republic, Jan. 1st.

WYOMING.

The mineral production of Wyoming for 1899 was $6,091,763, as follows: Gold, $1,003,101; coal, $4,659,156; copper, $265,960; iron, $114,000; silver, $309,456. Of the gold the Carissa mine at South Pass, and owned by Salt Lake men, produced nearly $900,000. Of the copper the Ferris Haggarty produced $149,364 and the Rambler $55,000.

CARBON COUNTY.

The Battle Lake Copper Exploration Co. is installing a plant of machinery on its mine at Battle Lake and will push development work. This company owns a number of copper properties in Battle Lake district. Part of the claims are near the Haggarty and Doane groups, which are the largest producers of the district. A shaft 400 deep will be sunk near the Mayflower group, where the surface showing is good.

On the Newsboy claim 4 feet of ore running 25% copper has been found. The mine is four miles east of Grand Encampment. The vein has proven to be continuous by a number of shallow cuts along its length.

FREMONT COUNTY.

(Special Correspondence).—The old Carissa mine of this place, which has been a producer for thirty years, is being developed by air drills. It has large bodies of fair-grade ore in three levels and stopes. The shaft is being sunk to open a fourth level. This mine is equipped with a 10-stamp mill, two 60 H. P. boilers, 60 H. P. Corliss engine, three concentrators, electric plant, compressor and air drills, the most complete plant in the State, and is a paying proposition, owned by Chicago parties.

South Pass, Dec. 26th, '99.

FOREIGN.

AUSTRALIA.

During the first ten months of 1899 the gold production of Victoria was 681,366 ounces. The total production of that province since 1851 is stated to be £253,464,284.

The occurrences of cinnabar has recently been attracting attention in New South Wales, Queensland, Victoria and New Zealand. The last reported discovery is that of a lode in the Waitahuna ranges, twelve miles from Berwick and half-way between that place and Waipori. Small pieces of cinnabar have frequently been picked up on the river bank, and, in consequence, a number of prospectors have been engaged for several weeks looking for the main lode, which has been found. It is 16 inches wide. Cinnabar, nearly pure, occurs 3 inches thick on the hanging wall.

BRITISH COLUMBIA.

W. Hall, manager of the Iron Mask mine, at Rossland, recently testified that he also had had charge of three mines at Republic camp, where the wages were $3.50 for ten-hour shifts, and that he had managed the Iron Mask under both systems—the ten-hour and eight-hour shifts—and there was little or no difference in the work attained under either system. They made an average of 15 feet per week with two shifts in all the workings under the old law, and 14.87 feet under the present law. In drifting, from 15 to 22 feet per week was accomplished under both systems. It cost more under the eight-hour, as they were obliged to employ three more laborers at $2.50 per day to keep the ore sorters busy. They could employ more drills with the same staff as they now had, but a time would come when they would require to again increase the laborers in proportion, and so on from time to time the increase would be necessary. The ore in the Iron Mask and Le Roi was identical. Fifteen feet of drifting a week is about the average of the camp.

It is reported that W. R. Peck of New York has been in Vancouver, in the employ of John W. Mackay, looking after mining deals. He made payments on several properties on Frederick's Arm, 100 miles up the coast from Vancouver, the total amount being $90,000. It is also said that Peck had an interest in the purchase for $150,000 of a property known as the Boscowitz mine. He also visited several of the copper properties on Texada island, including the Van Anda, owned by H. W. Treat of New York. A smelter was erected some time ago on this property and is being enlarged.

Frank Robbins, general manager for Mackenzie & Mann, at Phœnix, reports work making good progress in the Brooklyn and Stemwinder mines. He reports a strike in the North Star, one of the mines owned by Mackenzie & Mann, near Cranbrook, East Kootenay, for which he is consulting engineer. Nine feet of clean galena was found by Frank Parker, superintendent of the mine, 210 feet south of the mouth of the 60-foot tunnel, and 150 feet down the hill from the old 20-foot stopes. It is thought to be a continuation of the main ore body of the mine. This is the most important find that has been made in the mine in the past two years.

The mines of Ymir are located on fissure veins, carrying principally gold values, with small amounts of silver, lead, zinc and iron, the zinc or iron having no commercial value. In the Ymir group the best gold values are in the galena ores, which in stamp mills yield from 50% to 60% of their gold values on the plate. The Ymir mine is operated by the Ymir Gold Mines, Ltd., London. The ledge is 6 feet wide on the surface and 35 feet at a depth of 300 feet. The ore is principally galena. The company has a forty-stamp mill, with a capacity of 120 tons a day, and are putting in forty more. They employ 100 men. It is reported that the question of wages has been settled.

The richest lot of ore ever shipped from Rossland was sent out from the I X L to the Trail smelter recently. It consisted of half a ton of high-grade, free-milling ore, the assay of which was nearly $2400 per ton. The carload of twenty-two tons shipped last week ran about $35 per ton.

Another carload of high-grade ore has been prepared for shipment. Drifting has been started in other directions in the ledge struck on the third level, and a station is being cut to start a raise on the second level.

The Department of Mines of the Government of British Columbia has forwarded seventy-one cases of nuggets and gold dust for exhibition in the provincial section at the Paris Exposition. The gold is representative of all British Columbia's creeks.

CHINA.

U. S. Consul Smithers, of Chuogking, in a late report says: "The usual manner of getting ore in Yunnan has been to follow a lode from the surface into the ground as long as possible, without going to the expense of sinking a shaft or driving profitless tunnels. The miners have usually been left to do as they pleased under ground, as the Government officials and private capitalists have considered it beneath their dignity to explore the caverns dug at their expense or under their orders. The miners, in most instances, have been very badly treated, both by official overseers and private capitalists, and have taken their revenge on their employers by deceiving them to such an extent as to ruin them. Their mode of operation in this respect has usually been to expend all the available capital in getting very poor ore—in some cases no ore at all—and leaving columns of the best-paying ore standing in various parts of the underground working, easily accessible whenever it was desired. In this manner, the miners have almost invariably succeeded in exhausting the resources, as well as the patience of the officials and capitalists, with the result that they have been forced to abandon the mines as unprofitable investments, and the miners were disbanded and driven away without pay. After enduring suffering quietly for a time, the miners managed to repay themselves for their former trouble by extracting in a quiet way the ore they had left in the mines and selling it to petty local manufacturers or themselves coining money, sometimes of superior weight and quality to the legal Government issue."

MEXICO.

For 1899 it is reported that Mexico's export of metals, including the precious metals and their ores, will reach a value of $60,000,000.

It is reported that at Tepic considerable mining property has been changing hands; a railroad will be built from Port San Blas to Ixtlan; a million dollar smelter is to be built, and altogether $5,000,000 in gold will be invested there in the next year.

NEW SOUTH WALES.

The gold yield for 1899 in New Sonth Wales was 509,418 ounces, an increase of 168,925 ounces over 1898.

NEW ZEALAND.

New Zealand's export of gold is $2,000,000 greater than last year.

TASMANIA.

An unusual accident recently occurred at the Mount Lyell mine. The mine is worked by a series of benches in a large cut. Deep holes are put down in series and "sprung" with a small quantity of nitro powder before the full charge is put in. The men at work were warned as usual when about to blast and those working near retired to a short distance to avoid rocks which might fly from the collar to the hole. The powder blew out the bottom of holes and a number of men were injured.

The value of the minerals exported from Tasmania during November amounts to $800,000, one-third more than in the corresponding month of last year.

Personal.

W. G. SCOTT has been reappointed Supt. Mt. Shasta mine, Shasta, Cal.

B. H. TOMKIN of San Francisco is examining mining properties in Shasta county, Cal.

HOWARD FIELDING, Denver representative of Warren Webster & Co., spent the holidays in Chicago.

CHAS. A. REED has resigned the superintendency of the Bellvue mine, near Ophir, Placer county, Cal.

M. L. REQUA has returned to San Francisco from an inspection of his recently acquired mines in Arizona.

T. C. HOPKINS has been elected a director of the Cochite G. M. Co. and Vice-Pres. Navajo G. M. Co.

A. E. LINDROOTH, Denver agent of the Link Belt Machinery Co., recently made a business trip to the home office at Chicago.

T. C. JAMES AND THOS. NICHOLS of Shasta county, Cal., go this week to San Salvador, C. A., to operate a cyanide plant.

J. C. NICHOLS, Grand Junction, Colo., goes to China as mining and consulting engineer for a Chinese and English mining corporation.

ROY D. HUNTER, representing the Sullivan Machinery Co. at Denver, Colo., visited the company's headquarters in Chicago last week.

G. F. MILLIKEN, late of New York City, will superintend the future operations in the Uncle Sam G. M. Co.'s property, Shasta county, Cal.

WM. STANTON of South Milwaukee, Wis., is supervising the building of a steam mining dredge near Folsom, Cal., to operate on the American river.

O. H. PACKER has returned to San Francisco from Durango, Mexico, where he had been examining a mining property for a San Rafael, Cal., lumber firm.

CHAS. S. FORD is building a 20-stamp mill for the Young America G. M. Co. at Tuscarora, Nevada. The mill is at the shaft, on level ground, the ore being hoisted 65 feet to allow gravity action through the mill.

W. H. STORMS, who, since Feb. 20th, '99, has held the editorial chair of the MINING AND SCIENTIFIC PRESS, has been appointed by Gov. Gage to make an examination of the mines of the gold belt of California for the State Mining Bureau. Mr. Storms formerly was an assistant in the field in connection with the Mining Bureau, serving from April, '92, to Sept., '96, and is familiar with the work he has been selected to perform.

Industrial Notes.

—San Francisco has voted to spend $9,000,000 in municipal improvements.

—The wages of 25,000 men in Pittsburg were advanced from 5% to 10% this week.

—A complete telephone system is now in operation among the mines in the vicinity of Wallace, Idaho.

—The Washington Red Cedar Shingle Manufacturers' Association will be continued during 1900.

—The Great Northern Ry. Co. will sell stock to its employes at par, the amount in each individual case to be limited to $5000.

—A Pullman sleeping car is now running through from Kansas City to Mexico City, a distance of 2,300 miles, via the Mexican Central.

—San Francisco, Cal., has 16,475 telephone subscribers—the largest number, proportionate to the population, of any city in the world, except Stockholm.

—Ottawa will incorporate the Fort Simpson, Teslin & Dawson Railway Company, for a railroad from a point on the Pacific coast near Fort Simpson to Dawson City, via Teslin lake.

—Besides the extensive piping system to be put in at Cape Nome, that northern Mecca is promised a $150,000 floating wharf, to be constructed between rows of piles driven out to a distance of 4000 feet from the beach.

—A railroad is projected from Ione, Cal., to Jackson and Plymouth via Sutter Creek, Amador City and Drytown, a distance of thirty-five miles, by the Jackson, Sutter & Amador Railway Co. Capital stock, $2,100,000.

—The Coast and Geodetic Survey reports finishing the inland boundary line between California and Nevada from Lake Tahoe to the Colorado river, a distance of 400 miles, extending over the White mountains, through Death valley and the desert.

—At the Union Iron Works, San Francisco, shipyard lies a 13-inch rifled gun for the battleship Wisconsin, now approaching completion. The cannon is 40 feet long, weighs 70 tons and will throw a projectile ten miles. The Wisconsin will have four of these, the largest guns ever put on an American battleship.

—The following table shows the growth of railroad lines in the Pacific States:

State or Ter—	1870.	1880.	1890.	1898.
Washington	...	289	2,012	2,809
Oregon	159	508	1,439	1,615
California	925	2,195	4,349	5,292
Nevada	593	739	923	920
Idaho	...	206	946	1,118
Arizona	...	349	1,094	1,416
Utah	257	842	1,265	1,479
Totals	1,934	5,128	12,025	14,649

—A water-driven electric plant is proposed in Brazil to obtain 16,000 H. P. from the Tiete river and transmit it electrically to the city of San Paulo, twenty-four miles distant. A masonry dam 1000 feet long and 35 feet high will be built, and the water will be conducted by a steel conduit 12 feet in diameter and a half mile long to the turbines. The electric transmission is to be at 20,000 volts, three-phase, and the current will be used by a company which owns 104 miles of street railway in San Paulo.

—The Chicago drainage canal was opened with appropriate ceremonies on the 22nd ult. This great artificial waterway, which has been described and illustrated in these columns several times, has cost about $30,000,000, is 33 miles long, 300 feet wide, 36 feet deep, and connects the Great Lakes with the Mississippi river for navigation purposes, besides draining the city of Chicago.

—A stove manufactory sends the following which tersely shows the existing situation in the lines it discusses: Since the last advance in prices of stoves there has been a continual increase in the cost of all materials, including about $5 per ton on pig iron, and corresponding advances on other raw materials. There has also been a shortening of terms on most of the staples to thirty days, with either 1% or no discount for cash. Materials we use largely have advanced since last summer as follows:

Materials.	Per cent.
Pig iron	125
Copper	81
Wire	132
Lumber	87
Pipe fittings	111
Oils	100
Steel	100
Tin plate	78
Nails	170
Bolts	111
Pipe	184
Rivets	110

These advances in stove materials average over 100%. There seems to be no possibility of reductions for some time to come; therefore we find it necessary at this time to make another advance of 5% in the price of stoves, and the changing of terms to those usual in other lines of trade, viz: Sixty days, 2% discount for cash, ten days.

—In his annual coal and pig iron report for 1899, J. W. Harrison says: It is singular to report a smaller consumption of coal this year than last, in view of the large quantity delivered to the Government transports, and the general belief here that every branch of trade is brisk, which invariably leads to a large fuel demand. The consumption of oil as a steam producer is being enlarged monthly, but its benefit as an economical adjunct to our industrials will be neutralized, as its market value is about to be established by the usual "commercial cancer"—a combination or trust. With recent discoveries of oil over a large section of our State, and its low cost of production, it was supposed that our most serious setback, viz., low-priced fuel, had been overcome, but the pooling of issues now being discussed means advantage to the few and detriment to the consumers. The various sources from which we have derived our supplies are as follows:

	1899. Tons.
British Columbia	623,133
Australia	139,333
English and Welsh	93,263
Scotch	None.
Eastern (Cumberland and Anthracite)	39,951
Seattle (Washington)	271,694
Tacoma (Washington)	355,756
Mount Diablo, Coos Bay and Tesla	189,507
Japan, and Rocky Mountains by rail	28,390
Total	1,740,027

The total amount of coke received amounts to 31,091 tons, against 41,630 tons received last year. Three-fourths of the coke consumed here is imported from England and Belgium. The ovens at Comox, British Columbia, are now in full blast, as they propose shipping all their surplus to this market in 1900. They make a very fair grade there. The total deliveries of pig iron aggregate 6593 tons—of this 952 tons are English, remainder is American. The imports last year were 11,180 tons, which intimates a large shrinkage this year and a large falling off in orders for structural and mining purposes. The high prices now ruling will naturally diminish consumption. But little scrap iron is now imported; only 198 tons of foreign arrived. The fuel problem is a most serious one to solve in California, and is today in a most sensitive position. Our yards are comparatively empty; there are only three or four collieries on the Coast of any magnitude whence we may derive supplies; hence, if a strike, lockout or any accident should occur in any one of these, the consequences locally would be most disastrous. It is a perilous position to occupy; the tension is too great.

Commercial Paragraphs.

THE Taylor & Brunton Ore Sampling Co. now have offices in the Boston Bldg., Denver, Colo.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING DEC. 26, 1899.

640,158.—WEIGHING SCALE—J. S. Cox, Escondido, Cal.
639,714.—THILL COUPLING—B. D. Crawford, Salem, Or.
640,109.—BRIQUETTE PRESS—J. T. Davis, S. F.
640,116.—SAIL—J. Duthie, Portland, Or.
639,172.—SAW SET—F. Hanna, Santa Ana, Cal.
640,133.—KEY FASTENER—Hazeltine & Dodd, Los Angeles, Cal.
640,136.—SOLDERING MACHINE—R. D. Hume, Gold Beach, Cal.
639,855.—SEPARATOR—R. W. Jessup, S. F.
639,899.—CAR COUPLING—A. Keusink, Tacoma, Wash.
639,856.—BOTTLE STOPPER—H. A. Knight, Alameda, Cal.
640,142.—GAS GENERATOR—W. F. Love, Spokane, Wash.
639,858.—IRRIGATING PIPES—Martin & Ormand, Riverside, Cal.
639,756.—RAISIN SEEDER—W. M. McConnaughay, Fresno, Cal.
640,023.—AIR PUMP—P. B. Perkins, Los Angeles, Cal.
639,766.—GOLD SAVING DEVICE—L. E. Porter, Los Angeles, Cal.
639,906.—FRUIT GRADER—R. M. Pratt, St. Helena, Cal.
640,034.—CANNING MACHINE—O. Rubarts, Newport, Or.
639,911.—BUTTER CUTTER—R. A. Simpson, Ferndale, Cal.
639,871.—RAISIN SEEDER—Snyder & Hansen, Fresno, Cal.
640,043.—CURTAIN PIN—S. F. Stenner, Portland, Or.
639,835.—SAWMILL CARRIAGE—A. J. West, Aberdeen, Wash.
640,062.—CIRCUIT BREAKER—E. F. Winfield, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BOTTLE STOPPER.—H. A. Knight, Alameda, Cal. No. 639,856. Dated Dec. 26, 1899. This invention relates to a faucet which is especially designed to be used in connection with bottles containing soda water or other effervescent liquid which it may be desired to partially draw off without destroying the value of the remainder by allowing the gas to escape. One portion of the stopper extends into the neck of the bottle and the other exterior thereto, and is provided with a surrounding flange. Spring clamps each have one end secured to the bottle neck and the opposite end free and adapted to spring over the flange of the stopper and hold it in place. An elastic clamp embraces the two clamps which are secured to the bottle neck at a point between the ends to hold them in place. A slidable cap is fitted on to the stopper portion and has a discharge nozzle, so that, when it is pressed inward, a valve which is carried by the cap will be opened to allow the liquid to escape. When released, the pressure forces the cap outwardly, and a spring closes the valve at the same time.

CORSET STAYS.—Mary E. Thompson, San Francisco, Cal. No. 639,463. Dated Dec. 19, 1899. This invention relates to a device for interlocking and securing the edges of clothing, wearing apparel and the like. It consists of metallic hooks and loops formed upon the edges of the meeting plates, the loops having perforations to receive the hooks and having the edges turned over so as to partially enclose the points of the hooks after the two have been engaged. These turned over portions may also have holes or slots made in them to completely lock the points of the hooks and prevent their being accidentally disengaged.

Recently Declared Mining Dividends.

Cloverdale Zinc M. Co., Joplin, Mo., quarterly dividend, 2%; payable Jan. 10.

Bunker Hill & Sullivan M. & C. Co., Wardner, Idaho, $21,000; Jan. 4.

Empire State-Idaho M. & D. Co., 3%; payable Jan. 15.

Arizona Eastern & Montana Smelting Co., 2%; payable Jan. 10.

Grass Valley Exploration Co., California, regular quarterly, 25 cents per share; payable Jan. 20.

Latest Market Reports.

SAN FRANCISCO, Jan. 4, 1900.

SILVER—Per oz., Troy: London, 27d (standard ounce, 925 fine); New York, bar silver, 58¾ cts. (1000 fine); San Francisco, 58¾; Mexican dollars, 47¼c.

The statement issued by the Director of the Mint shows that the total coinage executed at the mints of the United States during the calendar year ended December 30, 1899, was $139,243,191, as follows:

Gold, $111,344,220.
Silver, $26,061,519.
Minor coins, $1,837,451.

The coinage executed during December amounted to $9,711,884, as follows:

Gold, $7,469,952.
Silver, $1,886,605.
Minor coins, $355,327.

The quarterly statement of the value of foreign coins issued by the Director of the Mint shows that during the last three months the value of silver has decreased .118 cent per ounce and the value of foreign silver coins has decreased accordingly. These figures will be followed in estimating the value of all foreign merchandise exported to the United States on and after January 1, 1900.

Some $7,000,000 or $8,000,000 may be considered as a fair estimate of the number of Mexican dollars circulating in the Philippines at this period. Besides this, a large number of half dollars were exported for use in Morocco, presumably to pay part of that country's indemnity to Spain, until legislation put an end to the business. On the arrival of the Americans a large amount of United States gold was brought by the military. Some difficulty was experienced in the beginning, as the natives and Chinamen did not know the values. The exchange of United States gold or silver to the Philippine or Mexican silver is commonly accepted at $1 United States for $2 Mexican or Philippine; but the exchange varies at the banks and large commercial houses, according to the value of the Mexican dollar in London and San Francisco. Mexican dollars, irrespective of dates, have been recently imported through the banks in large quantities. There is a shortage of subsidiary coinage, no fraction of the Mexican silver dollar having ever been in circulation.

COPPER.—New York Lake, $16.25; electrolytic, $16.00; casting, $16.12½; St. Louis, $16@16.25; San Francisco, 17½@18. Mill Copper plates, 23¾c; bars, 25½@27c.

LEAD.—New York, $4.70; St. Louis, $4.55; San Francisco, $4.55; pipe 7½, sheet 8¾, bar 6¼c. London, Spanish Lead £16 7s 6d=4.55½c per lb.

SPELTER.—New York, $4.55; St. Louis, $4.50; San Francisco, ton lots, 5¾c; 100-lb lots, 6¼c.

ANTIMONY.—New York, 9¼c; San Francisco, 1000-lb lots, 10c; 300 to 500 lbs., 11@14c; 100-lb lots, 15@18c.

BABBITT METAL.—San Francisco, No. 3, 6¼@8c.

IRON.—Pittsburg, American soft, $25.25; Scotch, $26.50; San Francisco, bar, per lb., 3¼c.

STEEL.—San Francisco, bar, 11½@20c per lb.

QUICKSILVER.—New York, $52.00; London, £9 13s; San Francisco, local, $51.50 ₱ flask of 76½ lbs.; export, $47.

PLATINUM.—San Francisco, crude, $14 ₱ oz.; manufactured, $19@22.

FERRO-MANGANESE.—San Francisco, ₱ ton, $30.

ZINC.—San Francisco, 53½; slab, 6½c; bar, 8.

ASSAY LITHARGE.—San Francisco, 10c ₱ lb.

TIN.—New York, pig, $26; San Francisco, $29; bar tin, ₱ lb, 35c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c.

NICKEL.—New York, 40@45c ₱ lb.

FERRO-TUNGSTEN.—New York, 60c; San Francisco, 75c (60%).

CANDLES.—Granite 6s, 16 oz. 9½c; 14 oz., 8½c; 12 oz., 7½c; 10 oz., 6½c.

POWDER. F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9¼c; less than one ton, 11¼c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

COAL.—San Francisco coast, yard prices: Wellington, $8; Seattle, $7; Coos Bay, $5; Southfield, $7.50. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, bd., $14.50; Scotch, $8; Cumberland, $9; Cannel, $9.50; Welsh Anthracite, $12.50; Rock Springs' $10.05; Colorado Anthracite, $14.50.

Assessment Notices.

MAYDAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 29th day of November, 1899, an assessment (No. 3) of ten cents (10c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 24 Post street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of January, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 20th day of February, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. P. HEALD, Secretary.

Office—Heald's Business College, 24 Post Street, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of December, 1899, an assessment (No. 22) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of January, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 27th day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

SAVAGE MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 8th day of December, 1899, an assessment (No. 99) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of January, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 30th day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

E. B. HOLMES, Secretary.

Office—Room 50, Nevada block, No. 309 Montgomery street, San Francisco, California.

SOUTH PALOMA GOLD MINING COMPANY, Limited.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Directors, held on the 6th day of December, 1899, an assessment (No. 1) of six-tenths (6-10) of a cent per share was levied upon the capital stock of the corporation, payable immediately to the secretary, John F. Barnett, at Room 22, No. 222 Sansome St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of February, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on the 19th day of February, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

JOHN F. BARNETT, Secretary.

Room 22, No. 222 Sansome St., San Francisco, Cal.

QUINCY MINING AND WATER COMPANY.—Location of principal place of business, San Francisco, California; location of works, Spanish Ranch, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of January, 1900, an assessment (No. 2) of forty cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 439 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of February, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

THOMAS QUIGLEY, Secretary.

Office—No. 439 California street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of January, 1900, an assessment (No. 10) of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of February, 1900, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

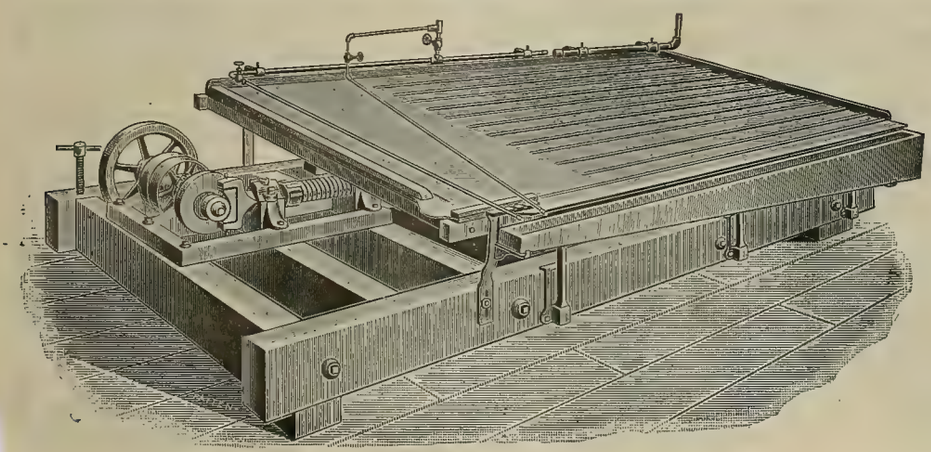
Principal Office: NO. 42 FREMONT STREET. - - - Works: Corners Bay, Kearny and Francisco Streets, SAN FRANCISCO, CAL.

SPECIAL DEPARTMENT OF

Hydraulic Mining Machinery,



Comprising Hydraulic Gravel Elevators, Double-Jointed Ball-Bearing and Single-Jointed Giants, Sheet-Iron and Steel Water Pipe and Fittings, Water Gates, Etc.

NOTICE.—All other forms of Hydraulic Gravel Elevators are simply poor imitations in construction and infringements of the patents held by us.

The Double-Jointed Ball-Bearing Giants recently perfected and patented by our MR. JOHN H. HENDY are incontestibly superior to any other form of Giants yet introduced.

We are prepared to furnish plans and estimates of cost of any proposed Hydraulic Mining Plants upon any specifications submitted to us, and tender the services of our Hydraulic Mining Engineer to erect and place same in successful operation under guarantee.

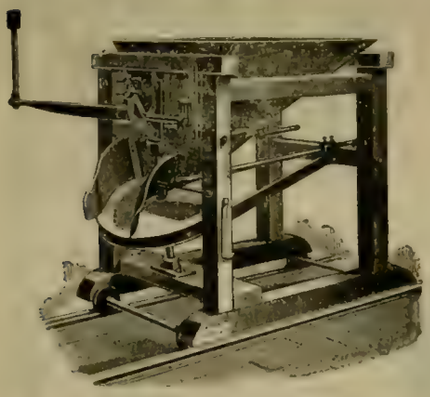
WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION.

SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.



MAKES HIGH PRODUCT.

CAPACITY FROM 5 TO 10 STAMPS.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes.

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

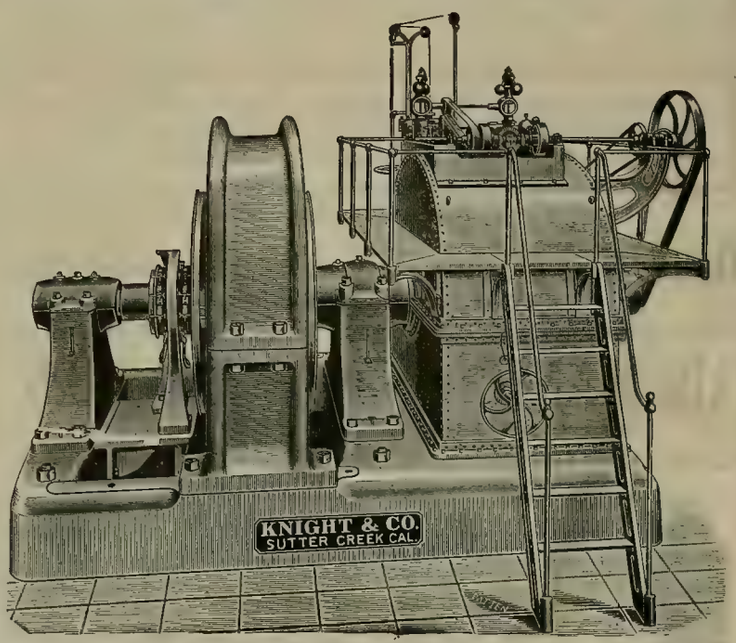
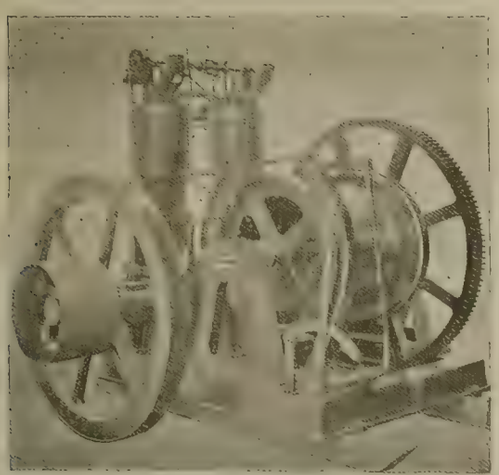
11-F



$1000.00 that there is no Belt Machine that will do more, cleaner, or better work than---

THE SPRINGER CONCENTRATOR.

The best 6-foot rubber belt machine in the market. You will see at a glance that this Concentrator embraces all of the best qualities of other good concentrators, besides many adjustments and improvements which none of the others contain. This machine is shorter than any other concentrator. See report of Supt. Lowring of Utica mine in "Mining and Scientific Press" of Jan'y 14, 1899, wherein he cut three 12-foot Frue vanners down to 8 feet in length and got a saving of 8 cents more per ton from the 8-foot than from the 12-foot machine after a thorough test of a run of thirty-five days. This is the strongest, simplest, most durable, less wear and tear, and takes less power to run than any other. It has only one-half as many pieces in its construction as in some concentrators. All belts are tightened by sliding boxes, and the shaking frame can be raised or lowered and leveled while running at full speed. Weight only 1500 pounds, thus a saving of one-half in transportation. This Concentrator is now running from Alaska to Mexico, and giving the best of results. All mining men should see thir Concentrator before purchasing any other. Price for 6-foot rubber belt machine, f. o. b., $400. Address all correspondence to **AMOS C. SPRINGER, 976 Pine Street, San Francisco, Cal.**



KNIGHT'S WATER WHEEL.

The accompanying cut shows the general arrangement of **The Knight Water Wheel,** direct coupled to a 750 kilowatt generator, with governor mounted on top of wheel casing.
These wheels are designed for **100 to 2500 H. P. Highest efficiency and regulation guaranteed.**
WHEELS FROM 6 TO 24 INCHES, ENCLOSED IN CAST-IRON CASING.
Wheels for mill and reversible hoisting works a specialty.

THE JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY : : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

Operator taking courses or horizontal angles with BRUNTON'S PAT. POCKET MINE TRANSIT.
If you wished to find the angle between two points below the horizontal with a sighting compass or an ordinary transit, you would first have to set up your tripod or staff and then level up your instrument. All this takes time.
If you only wanted to get the angle within a degree or so, you could take a BRUNTON TRANSIT, and, holding it in the position shown, take your readings in less time than you can dlace any other instrument. Send for descriptive catalogue B to

No. 044 BUTTON BALANCE. Sensibitity 1-100 milligramme. If you are in the market for the very best balance obtainable at a moderate price, write us for particulars about the No. 044. You will be surprised to find how cheaply it can be purchased for cash. While we cannot recommend this balance for fine gold work, a great many assayers are using it for such successfully. Send for illustrated catalogue A, for complete description and prices, to

NO. 3 LAMP.

McINTYRE'S DRY BATTERY

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

No. 1 weighs 2 lbs., 1½ C. P.	Price complete, $4.50.	For meter reading only.
No. 2 " 3 " 4 "	" " 6.00.	For Miners and general use.

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from morians or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

—SEND FOR CIRCULARS.—

These Machines are Kept in Stock Ready for Immediate Shipment.

"SMOOTH ON" CASTINGS

FOR LEAKS AND FRACTURES IN STEAM OR HYDRAULIC WORK IS MAGICAL.

It repairs a blemish in iron castings with a durable metallic iron finish that can be polished and will withstand a red heat. It makes a superior flange joint for steam, water or oil.

Write for Catalogue. Manufactured by SMOOTH ON MFG. CO., Jersey City, N. J., U. S. A.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and ½ inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

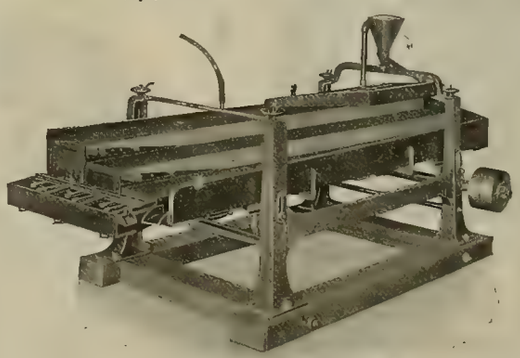
CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

THE BARTLETT CONCENTRATING TABLE.

One of these Machines will take the place of TWO or THREE Belt Concentrators of any make and do as good work.



Separates ALL the minerals from each other at one operation.
Gives THREE CONCENTRATES on the one Machine at the same operation.
The Machine is especially adapted to the separation of Zinc and Lead.

- PRICE: -

12-ft. Table, $[illegible]50.

SHIPPING WEIGHT - - - - - 2200 [illegible]NDS.

CAPACITY - - - 10 to 30 tons per [illegible]ours.

Parties desiring tests made can send 500 lbs. or more, charges prepaid, and a run will be made and reports forwarded of the results, free of all charges, except for the assays, which will not exceed $10.00.

CAN BE SET UP ANYWHERE.

REQUIRES NO SPECIAL FOUNDATION.

Licensee for the Manufacture and Sale, PARKE & LACY CO., 21 & 23 FREMONT STREET, San Francisco, Cal.

SOLE AGENT FOR

INGERSOLL-SERGEANT ROCK DRILLS and AIR COMPRESSORS.
KNOWLES PUMPS and PULSOMETER PUMPS, BULLOCK DIAMOND DRILLS.

PATENT AL.

CATALOGUES FREE ON APPLICATION.

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 2062.—VOLUME LXXX. Number 2. SAN FRANCISCO, SATURDAY, JANUARY 13, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Fig. 1.—The Lightner Mine, Angels, Cal.

Fig. 2.—A California Flume; Capacity, 6000 Inches.

Fig. 3.—Hydraulic Mine, Butte County, Cal.

Varied Mining Scenes.

The Lightner mine adjoins the Utica-Stickle mine at Angels, in Calaveras county, Cal., and is one of the latest properties on the central gold belt to attract attention. The headframe shown in the engraving (Fig. 1) is of the type commonly seen at California mines.

An idea of the size of an ordinary California flume may be gained from the accompanying picture (Fig. 2), which shows a horse and wagon being driven along it with abundance of room on either side.

The illustration of the pipe line crossing the mine on a suspension bridge (Fig. 3) is a scene in Trinity county, Cal. Three thousand miner's inches of water are conveyed by this pipe line, the water being used in hydraulic mining.

A typical hydraulic mine is illustrated in Fig. 4, although the monitors which give a characteristic appearance to such a scene are not in operation. The clearing of bedrock is the last act in hydraulic mining, and this process is in progress in Fig. 5.

Prospectors are prone to run their tunnels under a low hill and as close to the surface as they dare. The accompanying engraving (Fig. 6) illustrates a typical example.

Fig. 4.—Cleaning Bedrock in a Hydraulic Mine, California.

Fig. 5.—Pipe Line Crossing River on Suspension Bridge.

Fig. 6.—Entrance to a Fresno County, Cal., Mine.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Lightner Mine, Angels, Cal.; A California Flume—Capacity 6000 Inches; Hydraulic Mine, Butte County, Cal.; Cleaning Bedrock in a Hydraulic Mine, California; Pipe Line Crossing River on Suspension Bridge; Entrance to a Fresno County, Cal., Mine, 33. John Hays Hammond; Grand Central Mine, Tintic District, Utah; Current Wheels in Scott River, Siskiyou Co., Cal., 38. Latest Mining and Metallurgical Patents, 39. Arrangement of Receiver and Piping; Water Wheel Plant Installed at Columbus, Ohio, 40. Views in Esmeralda County, Nevada, 42.

EDITORIAL.—Varied Mining Scenes, 33. Future of the Rand; The Status of Alien Locators of Mineral Lands, 34.

MINING SUMMARY.—43-44-45.

LATEST MARKET REPORTS.—46.

MISCELLANEOUS.—Concentrates, 35. Notes on Ore Dressing; New Electrolytic Process of Manufacturing Chemicals, 36. Cyaniding in New Zealand; A Novel Application of Acetylene, 37. New Prices of Lead; The Grand Central Mine of Utah; A California Current Wheel; Premium on Gold Bars Removed, 38. Latest Mining and Metallurgical Patents, 39. A Water Wheel Plant; Price List of Leather Belting; Silver-Manganiferous Iron Ore, 40. Mine Ventilation; Construction of an Upraise; Colorado Coal Statistics for 1899, 41. Quicksilver Recovery from Greasy Refuse; Tungsten and Molybdenum Steel; In the Great Basin; Amendment to the Mining Law of British Columbia, 42. Precious Metal Product for 1899, 43. Industrial Notes; Personal; Commercial Paragraphs; Dividends; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Calendars, 45-46.

Future of the Rand.

The cyanide process is the cause of the present war in South Africa. The process made possible the profitable working of the banket reefs; the profit went too largely to the Boers to suit the Uitlanders, hence the war of conquest. These are the facts in short meter. They show the influence of modern metallurgy on modern history.

With politics—State, national, or international—this journal has nothing to do; the present conditions in the South African gold fields constitute a topic of interest to every metal miner and metallurgist, by reason of the magnitude of the gold mining and milling industry there, and its present cessation.

John Hays Hammond, a California miner, who has had foremost charge in Johannesburg, has been interviewed, and his interview has been made the basis of an article on the South African situation in the January number of the Engineering Magazine.

The Witwatersrand produced in '98 about 25% of the total gold product of the world, and Mr. Hammond thinks that had there been no interruption the gold output in '99 would have exceeded $100,000,000, coming almost entirely from a territory in a radius of twenty-five miles from Johannesburg. So vast a gold production exercises an enormous influence in the business, industrial, mining and engineering world, and the present war, occasioning interruption of that gold yield, evokes attention commensurate with the interests involved.

Mr. Hammond thinks that while destruction or impairment of mine equipage might not receive official sanction, there may be considerable wrecking of property, and that during the continuance of the war the Boer government will work the mines with a view to extraction of the maximum amount of gold with the minimum amount of care and development work; that the mines will be gouged and the machinery driven to death. He is also of the opinion that good will ultimately come of the conflict; the mines themselves—that is, the gold deposits—can not be destroyed, and with peace will come opportunities for reform and economy in mine operation that could not heretofore have been put in practise—increased tonnage of ore at decreased cost of treatment, thus compensating for present loss. Among the expected improvements upon the return of peace are cited the cheapening of cost of dynamite, and mining supplies in general, suppression of traffic in stolen amalgam and gold, improvement in means of securing native labor, regulation of liquor traffic, and, in general, the dominance of advanced methods. Mr. Hammond deems it within the limits of practical probability to work the Witwatersrand mines to a depth of 8000 feet. This, of course, involves considerable development work, and an assurance of continued security that could not be afforded during Boer dominance.

The future of South Africa's gold fields affects indirectly gold mining everywhere. It looks as though England may smash things ultimately and achieve final conquest, not solely for commercial aggrandizement, but as a "military necessity." England must conquer the Boers or be assailed in every part of her empire. In such event it can, therefore, be assumed with considerable degree of certainty that next year or the year after the gold deposits of the Witwatersrand will be exploited to their fullest extent, and that there will be a renewal in at least equal volume of the golden stream that has been pouring into the arteries of commerce from there since 1887.

As against the opinion of ultimate English success many unprejudiced men maintain that England has no likelihood of winning. In the Boston News Bureau of the 5th inst. a financier's opinion on the subject is thus given: "The fall of Ladysmith should be a favorable financial fact, because it should mean the near consummation of the war and the reopening of the South African gold mines for the benefit of the world's industry and commerce. There is only one result to this war, and that is the defeat of the English sooner or later. There is only one way for the Boers to fight and they have pursued that way perfectly, and that is on the defensive, behind entrenchments. They have not attacked the British in the open, and so long as they refrain from doing this they cannot be crushed without a sufficient number of men to surround them or flank them. England cannot spare from her own country enough men to surround the Boer armies. The Indian monetary commission unanimously reported that to place India on a gold basis, it would be necessary to sacrifice the English agricultural interests. The English yeomanry are not now available for foreign war. They have migrated to Australia and Canada and from Canada into the United States. The English yeomanry in the colonies are rallying to the support of the home government very admirably, and in time England may command enough men, if her colonies are loyal, to defeat the Boer armies in the field, but the certain result of this is the practical destruction, at least for some years, of South African gold mines. The machinery will have been destroyed one way or another, and the mines made practically unavailable for any immediate production. English success in South Africa means the obliteration of the Boers, the reconstruction of the gold mining industry and the repopulation of the country. The task is too great for the British Empire, and in the interest of civilization and the protection of the world's gold supply, a halt should be called, and the sooner the better. I believe our English cousins would be very glad if the United States would head a movement for the stoppage of this war, a settlement of the whole Boer question by arbitration, and the reopening of the South African gold mines under some kind of an international guarantee. England is whipped, and she can do no good to herself or anybody else by prolonging a useless war."

THIS year is as prolific in mining frauds as any of its predecessors. Gold mines are not as much a subject for the swindlers as formerly. Oil and copper are the favorite forms of spurious offerings at present. Eastern papers and magazines contain seductive advertisements of oil and copper mines in California and elsewhere, stock in which is offered with alluring statements concerning alleged profit. This stock is doubtless bought extensively by people who know no more about mining than mining does about them, and with money that many purchasers can ill afford to lose. There is little use in exposing those schemes; the kind of people who buy on the basis of such misrepresentation never see a mining paper and the journals that publish the lying prospectuses take good care to make no reference to any expose of the swindle. As for the mining public, they are, of course, too well posted to put the slightest faith in the ridiculous statements published. The one surprise is that apparently reliable and respectable journals will prostitute their columns and help swindle their readers by accepting such advertisements. The worst of these copper swindles, so far as California is concerned, at present emanate from Philadelphia.

The Status of Alien Locators of Mineral Lands.

The receipt of letters calling attention to the location of mining claims within United States territory by aliens, and particularly in Alaska, brings the existing and unsatisfactory condition of the mining laws relating to this matter into unusual prominence, in view of conditions now obtaining in Alaska.

The United States statutes plainly state that the mining lands belonging to the United States, both surveyed and unsurveyed, are subject to location by citizens of the United States or those who have declared their intention to become citizens. It is clearly evident that the intention of the law is that only citizens, or those who have declared their intentions to become such, shall locate and appropriate mineral lands; but aliens not infrequently do locate mineral claims, and to dispossess them is not, under existing laws, a simple matter. Instances where aliens locate or purchase from citizen locators and transfer the mineral lands of the United States are of frequent occurrence.

There has been much litigation arising from the transfer of mining claims by citizen locators to aliens, and of the latter to others, but the courts do not appear to have determined the status of an alien at all satisfactorily, and there has been a diversity of opinion. Concerning this, Lindley on Mines says:

Out of the chorous of discordant sounds it is difficult to evolve harmony. We think, however, that, considering the underlying principles which should govern the construction and administration of the law, the weight of authority, as well as motives of public policy, we are justified in deducing the following conclusions on the subject of alienage as affecting titles to unpatented mining claims on the public domain: (1) An alien may locate or purchase a mining claim, and, until 'inquest of office,' may hold and dispose of the same in like manner as a citizen. (2) Proceedings to obtain patents are in the nature of 'inquest of office,' and in such proceedings citizenship is a necessary and material fact to be alleged and proved. (3) In all other classes of action between individuals with which the Government has no concern, citizenship is not a fact in issue; it need be neither alleged nor proved. (4) Naturalization of an alien at any time subsequent to either location or purchase is retroactive and enables him to proceed to patent by reason of his alienage being removed. These conclusions are not altogether palatable, but we consider that they are forced upon us by the logic of the law. There is only one limitation upon these conclusions which may be plausibly asserted, and that is this: A qualified locator may relocate a claim in the possession of an alien who has not declared his intention to become a citizen, if such relocation may be made without force or violence and prior to the naturalization of the alien, as the alien might be deemed a mere occupant without color of title. The relocator is then in a position to contest the alien's right to patent. He would have the status of an adverse claimant, without which he would have no standing in court. * * * * We are loth to believe that a location by an alien is, under all circumstances, such a segregation of the tract from the body of the public domain as will inhibit a relocation by a qualified locator who enters peaceably and in good faith for that purpose.

From the above it will be seen that the matter is in very unsatisfactory condition. The alien may not attempt to patent his claim, as that is not required by law, but he may work it and derive large pecuniary benefit from it, while depriving a citizen of that privilege, for under most circumstances it is difficult to conceive a "peaceful" relocation of a rich mine being worked by another.

The Government only can intervene and dispossess the alien by "inquest of office," which means that an official investigation as to the citizenship of the locator may be instituted by the Government, and this in most cases would not be done promptly.

Under the laws governing agricultural filings, a citizen may file an adverse claim and thus at once institute a contest which invariably results in the dispossession of the alien. The matter should either receive immediate congressional action or officers should be appointed by the Government for the several mining districts, particularly those of Alaska, to protect the mineral lands of that section from wholesale location by aliens, as is now being done.

The entire matter is another instance of the pressing need for a Federal Department of Mines and Mining, when all subjects relating to the vast and rapidly growing industry which is the real basis of the nation's prosperity may receive the same prompt attention and intelligent consideration that is given other resources of the nation.

Concentrates.

THERE is a "permanent and available market for platinum" in New York and San Francisco.

BEYOND a yellow discoloration sulphur oxide or sulphurous acid would have no effect on asbestos.

THE mineral from Borax lake, Cal., is northupite—a double chloride and carbonate of sodium and manganese.

MODERN METALLURGY began in 1850, but has made greatest advances during the past ten years.

SULPHIDE OF GOLD has as yet never been isolated from any of the ores, and its existence in nature is a matter of doubt.

WITH few exceptions California mining dividends are carefully concealed. In Utah and Colorado they are widely published.

"P & B" PAINT is probably the best to use around a mine, either for wood or metal. It is fire and acid-proof and is an excellent preservative.

A MAGNET is demagnetized by a red heat. Temperatures produced by steam under 100 pounds pressure would not so affect a permanent magnet.

WITH a forfeited mining claim go the improvements thereon to the relocator. This includes buildings, machinery, etc., on the claim at the time of legal forfeiture.

HYDROGEN PEROXIDE added to the cyanide solution effects more rapid oxidation of the cyanide, and hence shortens the time occupied in dissolving the gold from the ore.

"JOSHUA WOOD" is the trunk and limbs of the yucca palm in the White Hills, Arizona, district. A cord of it will serve as fuel for a 25 H. P. hoisting and pumping engine for ten hours.

WHERE a note is given by one party and accepted by another with whom he has had dealings, the presumption obtains that it was intended as a settlement and satisfaction of all antecedent demands.

RUSTY steel can be cleaned with a mixture of—tin putty, 10 parts; prepared buckshorn, 8 parts; spirits of wine, 25 parts; mix to a paste; rub on the part to be cleaned, and wipe with blotting paper.

A GOOD magnesium flashlight can be made by sandwiching magnesium powder between sheets of paper impregnated with potassium chlorate. This, when properly prepared, is safe and satisfactory.

A PROMISE by a debtor to pay his creditor out of a designated fund, of which the debtor retains control, when the same is received by him, is a personal agreement only, and not a lien upon such fund.

MAGNESIAN LIMESTONE can be converted into hydraulic lime by burning it just hard enough to expel the dioxide of the magnesium carbonate, but not so hard as to expel that of the calcium carbonate, i. e., about 400° C.

IT was an ancient superstition among miners that tin would grow if the mines were to remain idle thirty or forty years. This idea has been traced through the centuries from the Phœnician miners in Spain to our own day.

THOUGH divisible by four this will not be a leap year. No leap year occurs between 1896 and 1904. Every fourth century has twenty-five leap years. The next century, the twentieth, will thus be one day longer than this one is.

THE Red Jacket shaft at the Calumet & Hecla mine cuts the lode at 3200 feet but is over 2000 feet deeper. Its size is 13½x23 feet inside timbers. The weight of the cage is 3000 pounds; the maximum speed of hoisting is 2000 feet per minute.

MICA in small flakes is a common constituent of granite, but is of commercial value only when in sheets over 4 or 5 inches square. The sample sent is of no value. A. O. Schoonmaker, 158 William St., N. Y. City, deals in marketable mica.

NOTHING about a mine, large or small, should be given more care than the making of good, substantial ladders, and placing them securely in the shaft or where needed. Frail structures of this class, poorly placed, are a menace to the lives of all who use them.

THE Mt. Morgan, Australia, mine has yielded gold 997 fine. The purest gold so far found in nature was taken from the Pike's Peak mine, Cripple Creek, Colorado, in '94—999 fine. Gold has been found in Calaveras and Tuolumne counties, Cal., 994 fine.

THE best work on gold milling in California is Bulletin No. 6, issued some years ago by the California State Mining Bureau. Its author is E. B. Preston. It is out of print. In case the Bureau can spare a few dollars it is possible another edition might appear.

PRECISE data as to the temperature of the sun is difficult to procure, no two observers agreeing. Recent minute calculations indicate a solar temperature of 5130° C., or 9266° F. Thirty-eight of the seventy-four chemical elements are found in the sun.

THE Zymean process does not receive much consideration from practical men. It consists of treating gold ore with sulphur chloride and a saturated solution of common salt. Sulphurous acid is given off from the dissolving tank and is used to precipitate the gold from the filtrate. If sulphur is not present in the ore, then sulphur must be added. The inventor adds nitrate of soda when gold is present in the ore. The theory is a pretty one, but the practise has not proved profitable.

WHERE the number and date of any U. S. patent are given, this office will undertake to supply printed copies thereof at ten cents each. The illustrated notices of recent mining and metallurgical patents that weekly appear herein are specially prepared for this paper.

IT would be difficult to determine where "the best mining is now carried on." Perhaps, all things considered, the work in the Lake Superior copper mines would compare favorably with any other metal mining for scientific advance, economy and improved appliance.

THE essential difference in quality between magnet and annunciator wire is in the insulation, the latter having paraffine in the insulation, the former having a thin insulation of cotton alone. To run too high an amperage through a wire will melt it; 25 amperes is a safe carrying capacity for No. 18 wire.

A GOOD fire extinguisher is made as follows: Eight parts common salt, six parts sodium bicarbonate, two parts Glauber's salt, two parts calcium chloride, two parts sodium silicate. Another mixture to put out a fire is made of: sal-ammoniac, 5%; sodium sulphate, 30%; sodium bicarbonate, 20%.

THE reports of the United States Geological Survey may be obtained through the agency of Congressmen. The maps may be had by purchase, few of them costing over 25 cents each. Communications should be addressed to Chas. D. Walcott, Director United States Geological Survey, Washington, D. C.

A GOOD resolve for 1900 is at the earliest opportunity to secure a United States patent for a mining claim. It is always well, it saves further assessment work, avoids litigation, and in case of desiring to sell is of prime importance. A good claim is easier of sale when the vendor can show title of U. S. patent.

PLATINUM mining, as such, is not known in California, though from California comes most of the platinum found in the United States. It is associated with placer gold, but is a "by-product" in this country. Platinum and vanadium have both been found in the ashes of certain coals in New South Wales.

A POSITIVE INDICATOR on a hoisting engine is a device geared positively to the drum shaft, and moving a target or indicator just as certain as the revolution of the drum raises or lowers the cage. Indicators arranged to work by use of a string or wire should not be depended on where men are raised or lowered in the shaft.

PURE gold will volatilize at a high temperature. It melts at 1045° C. (copper melts at 1050°, silver 945°), and, if kept at the melting point or slightly above, will not volatilize appreciably. When, however, that temperature is greatly increased, gold volatilizes, and, in the case of impure gold, that metal is volatile at considerably lower temperature than that stated.

MAGNETIC saturation is the maximum magnetic force which can be permanently imparted to a steel bar. A bar may be magnetized beyond this point, but soon sinks to it. The magnetism produced in a bar is prevented from depolarization by the retentivity or the coercive force of the bar. The higher the degree of magnetism the greater the tendency to depolarization.

METEOR STEEL resembles in its superficial substance the wavy appearance of Damascus steel. Twenty-four parts of zinc, four of purified nickel, and one of silver are put into a refractory crucible, the surface covered with charcoal powder, the cover luted on, and the whole subjected to heat till fused. When melted the mixture is poured into cold water to make it brittle.

AUROCYANIDE OF POTASSIUM is prepared by dissolving metallic gold, auric oxide or aurous cyanide in a solution of potassium cyanide, the salt crystallizing out upon evaporation of the solution. So long as the solution contains free potassium cyanide it is quite stable, but the aqueous solution of the crystalline salt is readily decomposed by the addition of salts of zinc, iron, tin or silver.

COLORADO has produced about $230,000,000 in gold; of this nine-tenths has been produced by modern methods. California has produced about $1,350,000,000; of that amount probably 75% has been produced by amalgamation. As late as 1868 this paper offered a reward of $5000 for a successful method of treating the gold sulphurets. "The best all-round process of metallurgy" is smelting.

A HORIZONTAL tubular boiler of ordinary proportions, 60 inches in diameter, 16 feet long, containing 83 inch tubes, has a surface area of 40,716 square inches. If operated with a working pressure of 100 pounds per square inch, the boiler sustains a total pressure of 4,071,600 pounds. The energy set free by the explosion of such a boiler at such a pressure is equal to the explosion of 1290 pounds gunpowder.

A COPYING INK that will copy legibly on tissue paper without water or a copying press can be made by taking 10 oz. nigrosine, C. P. fine, glucose A, 1½ oz., hot water 1¾ pints, and glycerine 1¼ oz. The nigrosine is to be dissolved by trituration in the hot water, the other ingredients to be then added and the mixture strained through a piece of silk. If too thick to flow from the pen readily it can be diluted with water.

THE Rossland, B. C., Miners' Union has 1500 members; of these 850 were born on British soil. The union pays $10 a week sick benefits. The prevailing rate of wages in that section is: Machine men, $3.50; hammer men, $3. The large mines use machinery. Muckers get $2.50 a day; a certain class of machine men, called shaftsmen, receive $4, and in some instances $4.25. It is customary to pay more in wet shafts or where the ventilation is bad.

ELECTRICITY direct from coal is not deemed an impossibility. It has not yet been produced in a commercial way, but has the attention of practical scientists. If carbon could be dissolved in a fluid, as metals are, the problem could be more readily solved. Harder things to do have been done, and the right way will be discovered sooner or later. Direct production of electricity from fuel, and light without heat, will probably be among the first discoveries of the twentieth century.

MINING SCHOOLS are doing a good work and are not to be decried. In one sense every mine is a "school" for those therein, but in the mining school the opportunities for study are exceptionally good, coupled with subsequent practical work requisite for those who realize how precious time is, and how much quicker and better one can learn things necessary to know amid such favorable surroundings. Such thorough grounding in technical education makes the earnest miner valuable to himself and his employer.

THERE is nothing new that is good or good that is new in the use of magnets in recovering gold from black sand. It is an old device and extensively used. In the bed of the Galisteo river, in the vicinity of Santa Fe, N. M., a placer mining company has had some success in saving gold from the black sand by magnets, placed on the circumference of a cylinder, iron adhering thereto, the gold, non-magnetic material and water passing on to a revolving screen and run over amalgam plates into a series of boxes containing quicksilver.

TELLURIUM is a constituent of the ores of gold, silver, mercury, bismuth and lead, forming with the metallic tellurides. Tellurium is soluble in sulphuric acid, giving a red solution, from which a blackish-gray powder of tellurium is precipitated by diluting in water. Sylvanite is a gold-silver telluride-tellurium 55.8%, gold 28.5%, silver 15.7%. Hessite is a silver telluride. Petzite is hessite with silver partly replaced by gold. Nagyagite is a foliated tellurium in leaves like graphite, and contains tellurium, lead, gold, silver, copper and sulphur.

MASSIVE eruptive rocks such as diabase and diorite, granite, syenite, andesites, etc., differ so greatly in physical appearance that samples of such rocks from any particular locality would not be useful in determining rocks elsewhere from their physical appearance alone. A material difference in the texture of a rock will make a great difference in its appearance, though the composition of each may be essentially the same. In the greenstone schists it is not always an easy matter to determine whether the original rock was diorite, diabase or a fragmental rock, as the original constituents are all more or less altered and little of the original structure remains.

HEAT-RESISTING powers of different materials suitable for steam boilers and pipe coverings may be rated as follows, a combination of asbestos, hair felt, air space and wood being given 100%: asbestos, hair felt and chopped straw, the latter mixed with lime putty, 87%; plastic cement, with ½-inch half felt outside, 86%; paper pulp mixed with lime putty, 1 inch, covered with sheeting of wood pulp, 85%; mineral wool cased with wood, 81%; mineral wool cased with sheet iron, 79%; charcoal, 60%; sawdust, 41%; loam and chopped straw sealed with wood, 32%; asbestos, 29%; coal ashes, 24%; air space, 20%; firebricks, 15%; red bricks, 12%; sand, 9%.

THE full official text in the recent decision in the case of the rights of tunnel cross-vein locators was published in the issue of Dec. 9, '99. The decision by the Supreme Court of Colorado had the practical effect of giving prior locators the right of all veins crossing their side lines, and to all blind lodes existing within the territory embraced within the side and end lines of the claim, and made side lines as well as end lines the limits of operation in following a vein on its vertical dip. The crossing of two veins practically parallel on their dip was also considered by the Court and the same principle held to apply. The Calhoun Company has appealed to the Supreme Court of the United States on a writ of error.

THE leading mining machinery firms advertise in these columns, and our readers can be supplied by them with what they need at fair prices. It is their trade announcements that enable us to furnish this journal at such a small subscription price. The contents of this one issue—costing the subscriber less than 6 cents—if bound in a technical volume would cost him from $3 to $10. It is the advertising patronage that pays the most of this expense; were it not for such patronage this journal as edited could not live unless it charged $25 per year instead of $3. Of course, the advertiser doesn't have his announcement in these columns just to insure the regular appearance of a publication even of such merit; he advertises for profit, for in no other way can he get so wide an audience at such small cost. When any of our readers have occasion to buy machinery or appliances of any kind, there are two good reasons why they should buy from firms advertising herein: First, because it is those firms that make it possible for them to get this journal for $3 per annum; and, second, because none but reputable concerns are announced herein, and, being the leaders in their respective lines, can guarantee satisfaction in price and quality to their customers.

Notes on Ore Dressing.

Written for the MINING AND SCIENTIFIC PRESS by A. W. WARWICK.

Possibly there is no department of mining work of more interest than that of ore dressing. The literature on this subject is rich and varied, but so badly scattered through the journals of various scientific societies that it is necessary to have access to a large library in order to reach it.

The importance of the subject was recognized at a very early date. Pliny has preserved for us a sufficiently explicit account of the Roman system of mining to show that considerable attention was given to the washing of ores. The famous work of Agricola, "De re Metallica," published at Bale in 1561, gives a splendid idea of the miner's work at the time of the Reformation. In a series of quaint woodcuts there is shown the framing of a stamp mill, the methods of spalling and sorting ores, jigging, buddling, sluicing, etc., as practised in Bohemia and the Tyrolese mountains. Any one who has seen Agricola's book and the small mining operations going on at the present day in some of the European districts, will readily recognize how slowly progress is made, and that the old system had valuable features enough to warrant its survival. Indeed, some of the illustrations might well pass in a description of some of the out-of-date Cornish mills to-day. According to Matthesius, in his work entitled "Sarepta," written in 1589, it appears that a Tyrolean, Paul Grommenstetter, invented the jigger in 1519, and that the first stamp mill was erected at Dippoldswalde, in Saxony, about the year 1512.

About this time the Fugger family, the bonanza kings of their day, by their extensive operations in mines, gave a great impetus to the art of ore dressing.

The great religious wars, however, broke up most of the mining operations on the continent of Europe, and very little advance was made for centuries. But such inventions as were made were spread by the immigration of the old German miners, until they reached England and even the then newly found mines in Mexico and South America.

Pryce, in his book, "De Cornubiensis," published at the end of the last century, gave an account of ore dressing as practised in Cornwall at that time. This account showed that very little advance had been made since the time of Agricola, except in some small particulars.

However, Karsten (1831) gives a very good and clear account of ore dressing, and shows that, since the invention of the steam engine, a great advance had been made. Gaetzschmann ("Die Aufbereitung," 1864,) and Rittinger ("Lehrbuch der Aufbereitungskude") gave for the first time a scientific basis to the subject. Von Dem Borne, Pernolet and Von Sparre about this time published the results of their brilliant researches, and, in fact, it is chiefly to the labor of these men that we owe our exact knowledge of the principles underlying ore dressing operations.

The recent work of Monroe (1890) has done much to add to our knowledge.

During the last twenty years a great deal has been done to systematic dressing operations, especially by the introduction of automatic machinery and by improving the methods of construction. A curious feature has been the steady reversion to an old type of slime-handling machines. Until quite recently, belt vanners were everywhere replacing the shaking or bumping tables; it seems, however, that the newer forms of tables are coming into favor. One good feature of the tables is that several classes can be made, instead of two, as in the belt machines.* For simple concentration—that is, when it is simply desired to make a rich product and a class of waste stuff, the belt machine still holds its own.

The greatest difference between a modern mill and one erected, say, twenty years ago, is in the character of labor required. Then, a large corps of skilled men were required, whereas to-day one highly skilled man, with a crew of ordinary unskilled labor, can handle a plant of moderate capacity.

The laws which govern the various operations have not been added to, to any extent, since the time of Pernolet and Von Dem Borne; but a thorough sifting and assimilation has removed many erroneous ideas and enabled us to properly apply them.

In order to effect the separation of the component minerals of an ore, advantage is usually taken of the difference in their specific gravities. If two grains, of about the same size, one of quartz (sp. gr. 2.6) and one of galena (sp. gr. 7.5) are subjected to the action of water or air in motion, it will be found that, under certain conditions, the grain of quartz will be transported, while the particle of galena will remain in statu quo, or, in any event, will not be transported as rapidly as the quartz grain. This is the principle underlying most dressing or concentrating operations. It fortunately happens that in most cases the valuable minerals have a higher specific gravity than the vein fillings or the worthless minerals. It should be added, in parenthesis, that coal, ozokerite, etc., are exceptions, each being lighter than the minerals from which they have to be cleansed.

It happens in some cases, however, that the specific gravities of the minerals are too close to allow of separation, for example, wolfram (sp. gr. 7.1) and cassiterite (sp. gr. 7.0), zinc blende (sp. gr. 4.0) and sidrite (sp. gr. 3.8). In these cases it is necessary to take advantage of other properties than the variation of specific gravities.

It may also happen that the mineral itself may be impure; thus it is impossible to separate the lead and antimony in the mineral jamesonite by the specific gravity method, inasmuch as the mineral is a chemical compound of lead and antimony. In such cases the properties taken advantage of are (a) difference in friability, (b) magnetic qualities, (c) as a last resource, the differing chemical reactions.

Wherever possible, however, advantage is taken of the difference in specific gravity, since the chemical treatment is expensive and the other methods are uncertain and difficult. Of course, exception is made in the case of magnetic concentration of iron ores, which is certain, rapid and inexpensive.

The course of treatment in an ore-dressing plant, treating such a material as a galena ore, would be in a wet plant:

1. Crushing to a suitable size.
2. Sizing by screens and hydraulic classifiers.
3. Treatment of coarse grains on jiggers.
4. Handling of sands on vanners, buddles, etc.
5. Treatment of slimes.

Such a method of dressing or concentration is known as the German system, and is frequently adopted.

The ore may, however, be treated and good results obtained without preliminary sizing and in such cases the treatment would be about as follows:

1. Crushing.
2. Rough sorting on jiggers into (a) poor mineral and (b) wastes.
3. Retreatment of poor mineral on finishing jiggers.
4. Treatment of slimes on suitable machines.

This is the old English method; it is largely used in the lead districts of the Middle States, but hardly anywhere in the West.

These methods are all wet, involving the use of enormous quantities of water. Many attempts have been made, with varying success, to dress ores without the use of water. In spite, however, of some most ingenious machines, the dry method has made practically no headway.

The specific gravity of the commonly occurring minerals are shown in the following tables:

TABLE I.

SPECIFIC GRAVITY OF PRINCIPAL ORES, ETC.

Mineral.	Sp. Gr.
GOLD—Native	17.0—19.4
Sylvanite	5.7— 8.2
Nagyagite	6.8— 7.2
SILVER—Native	10.1—11.1
Cloride	5.5
Argentite	7.1— 7.3
Stephanite	6.2
Ruby	5.5
MERCURY—Cinnabar	9.0
NICKEL—Smaltite	6.5— 7.0
Kupfenickel	7.3— 7.6
Chloanthite	6.5
Garnierite	2.3— 2.8
LEAD—Galena	7.2— 7.6
Cerussite	6.4— 6.5
Anglesite	6.2— 6.4
Wulfenite	6.3— 7.0
Pyromorphite	6.6— 7 0
COPPER—Native	8.8
Glance	5.7
Pyrites	4.1— 4.3
Malachite	3.7— 4.0
COAL—Anthracite	1.1— 1.8
Bituminous	1.2— 1.4
GRAPHITE	2.0
ZINC—Blende	3.9— 4.2
Calamine	4.0— 4.5
Smithsonite	3.2— 3.5
ANTIMONY—Stibnite	4 5— 4.6
Jamesonite	5.7
BISMUTH—Native	9.7
ARSENIC—Mispickel	6.3
Realgar	3.5
IRON—Magnetite	5.0
Spathic iron	3.8
Pyrites	4.8— 5.1
Hematite	4.5— 5.3

TABLE II.

SPECIFIC GRAVITY OF MINERALS ASSOCIATED WITH ORES.

Mineral—	Sp. Gr.
Barytes	4.6
Witherite	4.4
Wolfram	7.2
Flourspar	3.3
Calcite	2 5
Quartz	2.6
Selenite	2.3
Celestite	3.9
Chlorite	2.7
Feldspars	2.0—3.0
Hornblende	3.0—3.4
Shale	2.5—2.7

However, in using these tables, it must be noted that minerals of high specific gravity are not necessarily easily saved. For example, chloride of silver is notoriously difficult to save; where it occurs as horn silver no great difficulty is experienced; but, as it usually occurs as an extremely soft, friable powder, there is great difficulty in saving it.

The question of friability plays a very considerable part in ore dressing operations. As is well known, the fine material as it comes from the mine is nearly always richer than the larger lumps. By systematic screening the large waste dumps at the Cripple Creek mines and shipping the fines a great deal of the values were obtained; even after these operations, by washing the larger lumps, to free them from adhering dust, settling the slimes and drying the resulting mud, a further yield was obtained. It will be seen, therefore, that the friability of a mineral is of considerable importance, especially from the point of view of the ore dresser, owing to the fact that the fine sands and slimes are not only richer than the balance of the ore, but that it is more difficult to save the values.

It can be easily seen that, in designing a concentration works or dressing mill, a great number of considerations must be taken into account. A few principles which govern the design of a perfect mill, and which may even be called rules, are:

1. Absolute automacity and perfect separation is a practical impossibility. Any attempt to make the best possible separation of a complex ore with an automatic mill generally results in the overcrowding of certain parts of the mill or the reduction of its capacity.
2. The system of crushing is the best which produces the smallest quantity of fines. There is always a size below which it is unnecessary to reduce the ore, Any stuff finer than this is a waste of energy, and
3. The more finely divided is the material to be treated the greater the loss and the greater the cost of treatment.
4. It is desirable to save and separate the minerals as early in the process as possible.
5. The site of the mill should be chosen so as to have (a) ample room for machines without crowding, (b) a good head of water at command, (c) ample dump room and (d) facilities for cheap transportation from mine to mill.

*The Luhrig vanner is, however, a belt machine that is capable of making several classes of ore. The writer has made some fair separations with this machine.

New Electrolytic Process of Manufacturing Chemicals.

There has just been started at Farnworth, near Liverpool, England, the Hargreaves–Bird new process to separate chlorine and sodium by the direct decomposition of salt by electrolysis, without the introduction of other ingredient. The salt used is in its cheapest form—that of brine pumped from its native bed, the salt of which, delivered into the actual apparatus of the factory, costs 6 cents per ton, as against $1.70, the usual price for the rough salt used in the older alkali works. The apparatus is a narrow tank, with porous walls. Brine is pumped into it, and on the passage of electricity a solution of soda flows slowly down from the outside of these wet walls, yielding at once soda crystals; the chlorine in like automatic manner passes away for the production of bleaching powder, chlorate of potash or such other chlorine compounds as may be required. No furnace, nor sulphur kilns, are longer necessary. No waste materials are produced, unless as such be reckoned the ashes from under the steam boilers which produce the motive power for the generation of the electric current. Even the smoke from the boiler fires and the waste steam from the engine are used in carbonating and dissolving the soda thus formed. In the actual production scarcely any hand labor is required. All moves on in silent regularity, and it is only in the necessary handling and packing up of the materials produced that labor comes in. One distinction of the cell is the peculiar diaphragm used. It is a sheet of asbestos composition, non-porous in the ordinary sense of the term; but when forming the walls of the cell, the contents of which are electrically excited, it allows molecules of sodium hydroxide to pass, but very little sodium chloride. It is claimed that the above process is much more economical and simple than the former, including the rival electrolytic methods. One difference between the Hargreaves–Bird process and the Kastner–Keller process is that mercury is used in the latter process, but not in the former. Large sums of money have been spent in experiments with different electrolytic methods with varying success, and it is too early yet to say whether the new process will meet expectations.

IN putting on the twenty-five bunches of laths, or 1250 laths, which constitute a day's work, 7500 nails are driven. Over half of the laths are handled twice, and some are handled three times. Every whole lath has at least four nails, and with the broken laths it will average six nails to the lath. It takes two distinct blows of the hatchet to drive each nail, making 15,000 blows, or 1875 blows of the hatchet for each of the eight hours. The men must build their own scaffolding and handle the laths from the floor to the scaffolding. They must stoop to pick up each lath

and place it against the ceiling and walls and arrange the breaks and fit and space the laths, making fifteen more distinct moves, or 18,750 in handling the 1250 laths. Add to this the 15,000 strokes of the hatchet, making 33,750 motions in a day, or 4218 motions an hour, or a little over one motion a second, not allowing for the time and extra labor in building the scaffolding. It is an utter impossibility for the lather to put on an average of more than 1250 laths in a day and do his work right. They receive $3 a day. The best men average three days work a week, or $9 a week.

Cyaniding in New Zealand.*

Written by JAMES PARK, Thames, Auckland, N. Z.

Apart from three or four small plants for the treatment of tailings in the South Island, there is no cyaniding of any moment in New Zealand, outside the Hauraki gold fields in the province of Auckland.

The Hauraki peninsula is eighty-five miles long and varies from four to twenty miles in width. The surface is broken and everywhere densely wooded. The principal physical feature is a rugged axial mountain range, running in a somewhat sinuous course from one end of the peninsula to the other. It varies from 1200 to 3200 feet in height and forms the main divide or watershed from which innumerable subsidiary ranges or spurs, generally bold and precipitous, descend to the sea on both sides.

The average yearly rainfall is about 52 inches, and although the configuration of the peninsula forbids the existence of large rivers, there is no lack of small, never-failing streams which, as sources of power, make up for their deficiency in volume by the steepness of their descent.

Except at the Thames and Coromandel, the mining camps are much scattered.

GEOLOGICAL CONDITIONS.—The principal gold-bearing formation is of volcanic origin, consisting of a great accumulation of andesite lavas, tuffs, breccias and agglomerates. These are found in all stages of decomposition or alteration; and in many mines the hard, blue andesite can be seen to pass by a series of almost insensible gradations into a soft, or fairly hard, greyish yellow or blue altered rock to which the name propylite has been applied.

It is in this altered andesite that the veins yielding pay ore occur. They vary from a few inches to 40 feet in width, but in linear extension they can seldom be traced for any considerable distance. The ore values are also irregular, and in no case is the same vein or lode worked with profitable results in two adjoining mines.

TREATMENT OF ORES BY AMALGAMATION.—In the northern gold fields the ores, with a few exceptions, are free milling, consisting for the most part of greyish-blue quartz which generally carries pyrites ranging from $\frac{5}{10}$% to 2%. The gold is alloyed with silver to the extent of nearly one-third, its average fineness at the Thames being .680 and at Coromandel .760; but in most mines the fineness is subject to great variation, and even in the same lode the value will sometimes vary several shillings per ounce within the height of a stope. The gold occurs in leafy plates and in the form of a fine pepper-like dust scattered through the stone. It seldom exists in the sulphurets, and it is a matter of universal experience that in the battery tailings the values lie principally in the coarse sands.

In a pay ore, which means anything over 5 dwts. per ton, "colors" of gold are plainly visible in the stone; and conversely, an ore in which no gold is visible to the eye is seldom or never pay ore.

These ores are treated by wet crushing, plate amalgamation and blanket concentrations. The tailings are concentrated on Cornish buddles, and, if they contain a value of 2 dwts. or more per ton, are ground and amalgamated in some pattern of continuous overflow pan. The blanketings are ground and amalgamated in pans.

At the Moanataiari 60-stamp mill I tried, for a time, plate amalgamation, followed by close concentration with vanners and buddling of coarse sands. But after a few months' run this experiment was abandoned as unprofitable, principally on account of the low grade of the ore and resulting concentrates, and the high cost of cyaniding the latter. Subsequently the vanners were run so as to collect the coarse sands as well as the sulphurets, which were afterwards ground and amalgamated in pans.

The treatment by this method of 576 tons of high-grade ore, lately finished, gave a recovery of gold amounting to 82.51% of the assay value.

The 576 tons of general ore yielded eighty-five tons, or 14.75% of coarse concentrates, having a value of £9 4s 6d per ton, giving a total value of £784 2s 6d, of which 86.11% was recovered by pan amalgamation at a cost of 5s 5d per ton for quicksilver, water, labor, etc.

The crushing, milling and amalgamating costs of the general ore and concentrates amounted to 6s 10.78d per ton of 2240 pounds, or 6s 0.12d per ton of 2000 pounds.

TREATMENT OF ORES BY THE CYANIDE PROCESS.—In the southern portion of the peninsula the pay ores consist of whitish-grey chalcedonic or crypto-crystalline quartz, often possessing a wavy, banded structure of alternating layers of grey and blue flinty quartz. They are comparatively free from base sulphurets.

The gold is about .645 fine and usually associated with silver sub-sulphide (Ag_2S) in varying proportions. It is generally extremely fine, being seldom visible to the eye, and in the great bulk of the Waihi ore it is impossible to get even a color by panning.

DRY CRUSHING.—Prior to the introduction of the cyanide process these ores were treated by dry crushing and hot pan amalgamation with chemicals, by which a recovery of 65% was effected.

When cyanide treatment was adopted, dry crushing was naturally continued at the different mills, the dry pulverized material being charged into shallow vats and treated directly with cyanide. From 65% by pan amalgamation, the recovery rose at a bound to 85% and in some cases to 90%, and the results were so satisfactory that no further improvement was considered possible.

In a few years, however, it became apparent that dry crushing possessed many disadvantages, as compared with wet crushing, the principal ones being the cost of the preliminary drying of the ore, the low duty of the stamps, and the large number of vats required for leaching. In 1897, mine owners began to turn their attention to wet crushing, and one by one, since the beginning of 1898, the different mills have been adopting wet crushing, until at the present time dry crushing is the exception and not, as it was two years ago, the rule.

The practice of dry crushing as carried on at the Waihi Co.'s mills, although not an example to be followed, may be of some interest.

DRYING THE ORE.—The ore is dried in brick-lined kilns, which consist of open circular holes excavated in the solid rock. The kilns at the old 90-stamp mill were 37 feet deep and 20 feet in diameter, their capacity being about 100 tons. At the new 100-stamp mill the kilns hold a charge of 500 tons each. The lower part of the kiln is finished off with a brick arch, having a door and an iron chute for discharging the dried ore into trucks, which have access to the kiln by means of a tunnel.

The kilns are charged with alternate layers of ore and wood, the layers of wood being about 5 feet apart. When the kiln is fully charged the wood is lighted, and after it is all burned up about half the charge is withdrawn and an equal portion of raw ore is added on top, together with the necessary firewood. When this second charge is burnt the lower half of the charge is withdrawn and another charge of ore and wood added on the top. Thus the successive charging and drawing off is carried on continuously.

This method of drying has very little to commend it and possesses many serious disadvantages, of which the most obvious are: (1) the high cost of fuel and labor, and (2) the risk of unconsumed charcoal remaining in the ore. In the case of pyritic ore the varying temperature to which the ore is subjected, especially in large kilns, also tends to have a pernicious effect.

At the other dry-crushing mills in New Zealand automatic revolving driers are used, the consumption of fuel being only about one-quarter of that in the open kilns.

CRUSHING AND PULVERIZING.—The dried ore is trucked to the stamp mills, passing first through a No. 5 Gates crusher and thence through a trommel, the coarse material falling automatically into a No. 3 Gates. From the crushers the ore is trucked to bins lined with sheet iron, as a precaution against fire.

The stamps weigh from 900 to 1000 pounds and drop from 103 to 105 times a minute. The height of drop varies from 7 to 8 inches. The ore is crushed through 30 or 40-mesh wire-wove screens, the duty of the stamps varying from 1.5 to 1.7 tons of 2240 pounds per day.

The dust nuisance, which at one time was intolerable, is now kept down by an exhaust air pipe, with which each mortar box is connected. The dust is caught in a dust chamber and from time to time collected and mixed with the general ore. It is a somewhat curious and interesting circumstance that the finer the dust the higher the value.

At my request E. G. Banks, the company's metallurgist, sampled the dust that had settled on the rafters and timbers of the mill house, with the following results:

		Value per Ton.		
		£	s.	d.
A.	Dust from floor of mill to 10 feet high.	6	16	4
B.	" " 10 feet to 20 feet high.....	7	2	4
C.	" " 20 " 30 " "	7	3	1
D.	" " 30 " 40 " "	7	19	11
E.	" " 40 " 60 " "	8	13	8

The average value of the ore from which the dust was obtained was £4 1s 4d per ton.

CONVEYING THE PULVERIZED ORE.—At the old mill the pulverized ore is conveyed to storage hoppers by means of screw conveyors. From the hoppers it is trucked to the leaching vats. At the new mill a long line of screw conveyors carries the dry pulp direct to the vats.

THE CYANIDE TREATMENT.—At the old mill there are thirty-two wooden vats 22.5 feet in diameter and 4 feet deep, with the necessary sumps, tanks, extractors, etc. At the new mill there are ten rectangular concrete leaching vats, 50x40 feet in area and 4 feet deep.

The wooden vats hold a charge of thirty tons and the concrete vats of 150 tons each. The depth of the charge in each case is about 24 inches. With a greater depth of material the difficulties attending percolation became too great for economical working.

After the charge is leveled the strong solution, containing from 0.33% to 0.4% of cyanide, is run under the filter cloth until it shows on the surface of the pulp. The balance of the solution is then run on top of the charge. The portion of solution remaining below the filter is also pumped on top.

The strong solution (in the proportion of 1 to 3 of ore) is allowed to percolate for thirty to forty hours. The weak solutions (1 to 3 of ore, and containing 0.1% to 0.03% of KCy) and the water washes are then applied in rapid succession, their filtration being assisted by an artificial vacuum of 20 to 25 inches of mercury. Each ton of ore gets washed with one ton of water in four separate portions.

About five days are required for the washings, and the total treatment of each vat occupies about six and a half days.

The residues are sluiced out through side doors, one man emptying 150 tons in eight hours.

The solutions from the leaching vats are clarified by running them through two filters, whence they pass to the zinc extractor boxes, which are of such a capacity that 1 cubic foot of zinc is provided for every ton of solution per day.

The consumption of cyanide varies from two to two and a half pounds per ton of ore treated, and that of zinc is about six and a half ounces, costing 5d per pound.

The drying and smelting of the slimes call for no special notice.

I am indebted to Mr. Banks for the following schedule of costs:

MILLING COSTS PER TON.

	s.	d.
Drying the ore, labor and fuel.....	1	0.60
Crushing, including maintenance.....	1	3.34
Stamping, including maintenance.....	1	10.69
Total.....	4	2.63

CYANIDING COSTS AT NEW MILL PER TON.

	s.	d.
Wages of labor.....	0	4.46
Cyanide.....	2	0.00
Zinc.....	0	2.00
Filter cloths.....	0	0.70
Cleanup and smelting of slimes.....	0	4.10
Total.....	2	11.26

The total cost of milling and cyaniding is 7s 1.89d per ton, not including management and general expenses, which are not given.

The actual recovery is reported by the management to be 89% to 90% of the gold, and 55% to 60% of the silver, from ore ranging from £3 10s to £4 per ton.

For a year or more bunches of high-grade pyritic ore have appeared in the lower levels of the company's Martha lode, and, with increasing depth, will probably become more abundant. It has been found that the treatment of this ore by dry crushing is not successful, on account of the partial roasting occurring in the kilns, resulting in the formation of basic sulphates, etc., which cause a large consumption of cyanide, accompanied by low extraction. Wet crushing and concentration of sulphurets, followed by cyaniding of sands and slimes, naturally suggest themselves as the proper treatment; and experiments in that direction are now being made at the old mill.

At the other dry-crushing mills on these gold fields the milling and cyaniding practise is practically the same as at Waihi, except at the Whangamata Proprietary, where the ore is pulverized by ball mills, and at Talisman, where both stamps and ball mills are used. In all cases the ore is dried in revolving driers, the use of which results in a great saving of cost of both labor and fuel. At the Talisman mill one ton of firewood dries twelve tons of ore, while the consumption of the same amount of wood is required to dry only three to four tons of ore in the Waihi open kilns.

(TO BE CONTINUED.)

A NOVEL application of acetylene has been made in lighting a mine near Ottawa, Canada. The manager of the silver and lead mine, where the application mentioned was made, recently described the installation in a paper presented to the Canadian Institute of Mining Engineers. The generating plant was placed in an out-of-the-way shaft, and $\frac{3}{8}$-inch tubing conducted the gas to the point where it was consumed in a portable burner, which could easily be fastened in any crevice in the rocks. It is claimed that the increased amount of work resulting from the use of the light more than compensated for the additional cost, not to mention the health of the men, which was said to be better, and the convenience of the portable light.

*Condensed from Transactions of American Institute of Mining Engineers.

New Prices for Lead.

Written for the MINING AND SCIENTIFIC PRESS.

The fiction of "brokers' prices" that fooled nobody has been done away with in 1900, and hereafter the basis will be the prices that ruled in New York the preceding week. That is what the American Smelting and Refining Co. will do, and for the present at least that "goes."

T. R. Jones, district manager for the combine at Salt Lake, Utah, writes: "After January 1, 1900, the American Smelting and Refining Co. wishes to do away with the brokers' quotation on lead, and in its lieu the quotation of the average actual sales in New York for the previous week will govern the settling price of lead for the week following. The full price of these average sales will be paid, less a deduction of ⅛ of a cent per pound."

The plan is to have the average price of lead which ruled in New York City during the week wired the different managers of the different districts every Monday morning, and the settlement for the current week will be on that basis—less ⅛ of a cent per lb.; for instance, to-day's quotations, $4.70, less ⅛, would make the price $4.57½.

That the market will fluctuate is manifest; that the system will not induce or insure general satisfaction is equally plain; but it is deemed an improvement over the old way. The fact that the purchasers have the making of the market, the setting of the pace and price, and can arbitrarily raise or depress values, is too obvious to need more than reference. With the lead producers of Colorado, Utah and the coast rests the final verdict.

The first effect is satisfactory, in an increased price. Lead has fluctuated so much, and "brokers' quotations" have so spoiled markets as to occasion an annual loss of many hundreds of thousands of dollars. The present quotations are the best in many years. Ten years ago lead was $3.85 (and silver was $1.05¾). In August, '90, lead went to $5, and in October of that year $5.25. In January, '91, it went down to $4.05, silver being quoted at $1.03¾. January 1st, '92, lead was $4.25; silver, 94⅝c.; and in June, '93, lead ruled at $3.40, silver 62c. Lead drooped during '94 and '95, and in August, '96, went down to $2.50 per hundred lbs. On January 1st, '97, it had advanced to $2.90; January 1st, '98, $3.70; December, '99, $4.45. The quotation of $4.57½ looks well alongside the above figures. In the new deal it is understood that the National Lead Co. has got the worst of it.

The result must be the stimulation of the mining of plumbiferous ores, for they are a prime requisite in the smelting of dry ores. It will also affect the present international relations in the importation of British Columbia lead ore. Indirectly it will also aid the producer of silver-lead ores. There is an increase in the working charges, nothing is paid for the lead in lead ores containing less than 5% of that metal. Nevada complains: "Ninety per cent of the assay of lead at New York quotations is now paid, less $30 per ton, which, with the ½ of 1 cent per pound added, makes a deduction of $32.50 per ton. In the past from $23.50 to $27.50, depending on the percentage of lead, was deducted. This will make a difference of from $4 to $9 per ton on lead. We also pay $1 per ton more for treatment charges."

The Smelting & Refining Co. say "this is the best we can do. In Utah the increased price of coke, coal and iron ore makes an additional expense to our Salt Lake smelters of $175 per day."

The new adjustment can not give universal satisfaction, but will tend to postpone the inevitable opposition that the combined smelting interests in the districts affected must inevitably meet.

The Grand Central Mine of Utah.

The Grand Central mine in Tintic district, Utah, lies between the Centennial-Eureka and Mammoth mines. The work of opening the property began in 1895, and for three years the owners were engaged in sinking and developing the mine, having to sink deep to reach the ore bodies.

Grand Central Mine, Tintic District, Utah.

John Hays Hammond.

(See page 34.)

In June, 1898, they had accumulated a surplus from which to begin paying dividends of $31,250 each, and by the end of the year they had thus divided among stockholders $218,750. In 1899 they paid $287,500, bringing the total to 1900 up to $506,250. During 1899 they paid $22,000 in the purchase of three more claims to add to the eight which the group contained, making their aggregate holdings about 220 acres. The shaft was sunk 200 feet deeper and is now down 900 feet. About 3000 feet of drifting and other cuttings were made in the mine during the year, an average of 130 men being employed. Besides this work a steam hoist capable of going to a depth of 2000 feet was put in along with a shafthouse, constructed of steel, and these with the compressor and power drills make it one of the best plants in the district. The cost of these improvements of the year aggregate $65,000, and includes a portion of the cost of the water system, of which nearly all was put in the year before. The product of the mine for the year 1899 was over 14,000 tons.

The ore is high-grade and of a desirable smelting quality. The property belongs to an incorporation with but few stockholders, and its directors are C. E. Loose, L. Hallrock and Reed Smoot, all of Provo, and George Q. Cannon and William Hatfield of Salt Lake City. L. Hallrock is manager and J. R. Twelves of Provo is secretary and treasurer.

In the mine there are large bodies of high-grade ore, while the second-class is very extensive. In mining, this second-class has accumulated to the extent of 20,000 tons.

MOUNTAIN toothache is a new addition to our bodily ills. It has attacked engineers and laborers on the Jungfrau railroad at a height of 8500 feet above sea level as a jumping toothache that attacks several teeth at a time, lasts seven or eight days and leaves the patient with aswollen face, which it takes another week to reduce. After that, the teeth are acclimated and give no further trouble.

IRON rust is a hydrated sesqui-oxide of iron. It is composed of: Iron, 56 parts; oxygen, 24 parts, and water, 20 parts. In every pound of rust there is a quarter of a pound of water. It is a case of water solidifying without freezing.

AT Cripple Creek, Colo., the combine places smelter price for gold at $19.50 per ounce, an indirect advance in treatment charges, it being an increase of $2 per ton on 4-oz. gold ore.

A California Current Wheel.

Readers familiar with the appearance and operation of current wheels in irrigation ditches or along the margins of valley streams will be interested in the use of the same device in the mountain stream known as Scott river, Siskiyou, the most northerly county of California. In streams which run low in summer and move around in their beds as they see fit the water lifter who wishes to use the wheel has to establish his construction wherever the channel may be, or else do a lot of diversion to bring the water to his wheel. In the case shown in the engraving the conductor of the enterprise evidently preferred to take his wheel to the water. He has made cribs of rock to sustain his sideworks and hung his wheels where he could get the longest run of power. The device was installed for river mining, but other arrangement can readily be constructed to convey the water, which the engraving shows has been raised several feet from its natural surface, through a flume for irrigation of adjacent lands which lie below its flow. The upper wheel is rigged not for water lifting, but for power, and this can also be conveyed by belt or cable and put to various uses. In irrigation a current wheel is sometimes used to deliver water on the bank, where it can be distributed therefrom by ditch or it may be run for power to operate a pump to deliver water at a higher level than that to which the wheel could directly lift it by its own revolution.

There are objections to current wheels, one of which is that their effective labor is limited in several ways. Another, and one which would suggest itself to any one who looks upon this picture, is that there is danger of a rise in the stream, which would tear out the wheel and land it in the next county. This is sometimes a menace to a current wheel, whether it be by the bank or in midstream, and it has to be provided for—sometimes by taking out the affair until the season for torrential flow is over. Windmill irrigators near Sacramento, Cal., unship their windmills during the wet season, so that wear and tear and danger of blowing to pieces may be prevented, and the current wheel man has to be similarly circumspect in saving his mechanical bacon.

Current Wheels in Scott River, Siskiyou County, Cal.

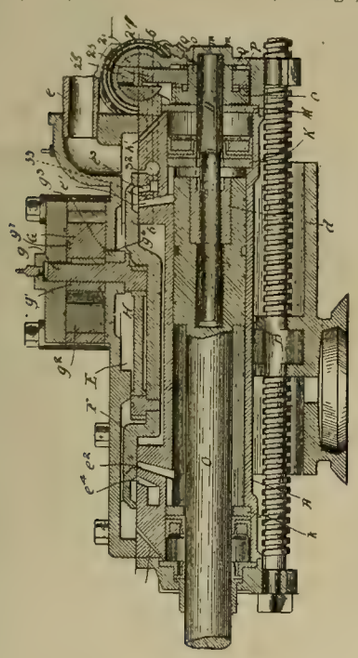
Premium on Gold Bars Removed.

To discourage the shipment abroad of gold coin the Treasury Department will remove the premium on gold bars at the assay office. This premium at present amounts to an export charge of one-tenth of 1%, and has helped the shipment abroad of gold coin instead of bars. This practice works directly disadvantageous to the Government. Our gold coin is now full weight and is as acceptable for export as gold bars. Exportation subjects gold to abrasion, reducing the coins in weight and thereby causing the Government considerable loss in mintage and metal. The cost of coining gold by this Government is ½%, and this may be said to constitute the loss on abraded coin. No action has been taken by the department for the removal of this premium. The officials, however, believe the premium to be so wholly disadvantageous to the Government that if any applications were made for its removal from gold bars for shipment the request would be granted. The situation at present simply lacks an application on which a decision may be made by the department to establish a precedent.

The premium of one-tenth of 1% on gold bars in-

tended for shipment abroad was established during 1895. The premium for a time was paid by exporters rather than risk light weight in abraded coin. Now that the coin is full weight the advantage of sending bars is nothing, and gold coin has formed almost the total bulk of shipments abroad. The removal of the premium was recommended in the recent report of the Director of the Mint, made to the Secretary of the Treasury.

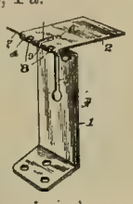
The Director says in this report:



"The Superintendent of the New York Assay Office calls attention to the fact that, although about $30,000,000 in United States gold coin was exported last year, no bars were taken for export, and suggests that the export charge of one-tenth of 1% which is exacted is operating to our disadvantage. There is no object in forcing the public to take our coin out of the country by making it more expensive to take bars. We had better furnish the raw material than the manufactured article. These bars will have to be shipped, melted and worked into coin at some waste and considerable expense to replace the coin exported, while the bars would have served every purpose for export. The export charge was put on bars several years ago, when gold exports were heavy, and some means to discourage them was sought. When the current coin is abraded exporters will pay a slight premium to get bars which are full weight, but our current gold coin is now largely new, and on the average close to the standard, and exporters are preferring to ship it rather than to pay the bar charge."

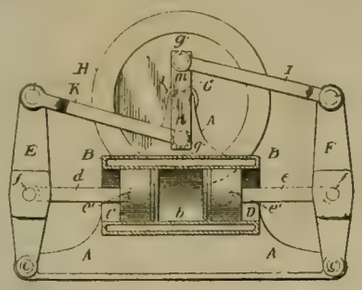
Latest Mining and Metallurgical Patents.

Patents Issued Jan. 2, 1899.



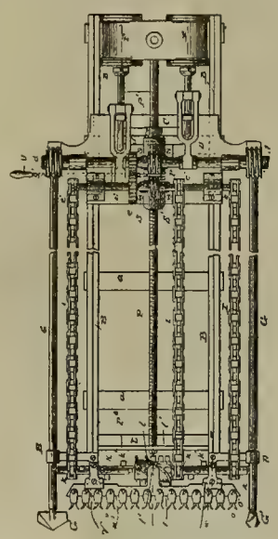
Specially Reported for the MINING AND SCIENTIFIC PRESS.

ROCK DRILL.—No. 640,341; G. D. Whitcomb, Glendora, Cal., and W. K. Milholland, Chicago, Ill.



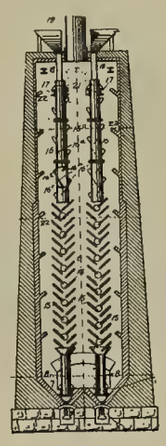
A fluid-actuated rock drill, in combination, a cylinder, a piston reciprocating therein and carrying a drill bar, a valve chest, ports leading from chest to the opposite ends of the cylinder; an angular rotating bar on the axis of the cylinder and in sliding engagement with the piston, a ratchet wheel fixed upon the rotating bar and having teeth on its disk face, an annular pawl concentric with such bar and having annularly arranged teeth for co-operating with the teeth on the ratchet, a spring for forcing the pawl into engagement with the ratchet, an arm projecting radially from the pawl, a piston for oscillating the pawl, such piston having a transverse recess and a shoe reciprocating therein, with which shoe the arm of the pawl is pivotally engaged; a cylinder within which the last named piston reciprocates, ports leading from the valve chest to the opposite ends of the last named cylinder, a valve for simultaneously controlling the ports of both cylinders, and motor for shifting the valve.

BRACKET FOR MINERS' LAMPS.—No. 640,387; T. R. Jones, Wilkes-Barre, Pa.



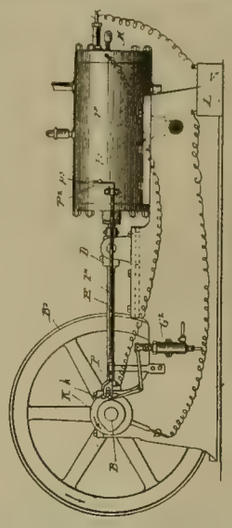
A lamp bracket for miners' caps having a bend in its upper portion and eyes formed thereon, a slot extending through bend and adapted to receive the shank of lamp hook and an opening in the rear of slot for the point of the hook, in combination with a lamp retaining device consisting of a wire or pin removably arranged within eyes and extending across slot.

MOTIVE POWER.—No. 640,710; J. A. Secor, New York, N. Y.



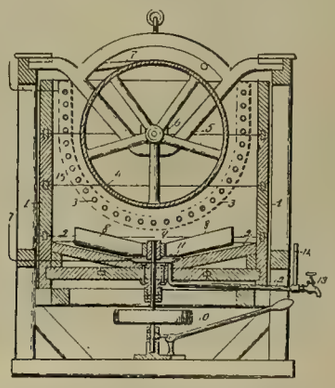
Combination with bedplate, cylinder bedded thereon with the ends of the bedplate extended beyond the end of the cylinder, duplicate pistons arranged for movement in opposite directions within the cylinder, and a crankshaft the cranks of which extend in opposite directions, of levers fulcrumed at their lower extremities to the extended ends of the bedplate, crankrods which connect the free ends of the levers with the cranks of the crankshaft, and connecting rods which connect the pistons with the levers at points between their fulcra and their pivotal connections with the crankrods.

MINING MACHINE.—No. 640,621; A. Bailey, Philipsburg, Pa.



A mining machine, combination with bed, carriage, two reciprocating cutters each forming a separate kerf and means for simultaneously reciprocating cutters in opposite directions whereby they balance the machine laterally, of a drill mounted on each side of the carriage and forming an aperture at the end of the kerf.

VERTICAL AUTOMATIC DRYING AND ROASTING FURNACE.—No. 640,715; J. Stoveken, Milwaukee, Wis.



Combination with vertical ore roasting chamber having an ore inlet at the top and a discharge opening at the bottom, of means for maintaining a vertical column of ore between these two openings and in a central position in the roasting chamber, whereby the heat is allowed to pass upward around the ore, comprising inclined shelves supported by the furnace walls, and located in the lower part of the furnace, the wall of the chamber being provided with openings opposite the ore supporting means to permit access to the column of ore, and detachable plugs normally closing openings.

GAS ENGINE IGNITER.—No. 640,392; G. W. Lewis, Philadelphia, Pa.

A gas engine having an electrical sparking device or devices, a bifurcated contact piece one arm of which is adapted to be temporarily moved into position for completing the circuit through a revolving contact when the crank arm is past the dead center, the other arm of the bifurcated electrode being permanently in position to give electrical contact when the crank arm is approaching the dead center in the direction of its operative revolutions, in combination with means for breaking the circuit within the cylinder by hand.

PROCESS OF EXTRACTING PRECIOUS METALS.—No. 640,718; C. P. Tatro and G. Delius, Seattle, Wash.

Separating precious metals from ores, process comprising following steps: reducing the ore to a fine pulp; dissolving the metals from the foreign matter by immersing and agitating the pulp in a bath comprising an aqueous solution of common salt, a small percentage of bromine, caustic lime and other reagents for precipitating undesirable metals from the electrolyte; gathering a portion of the precious metals from the bath by revolving a cathode drum partially immersed in bath while latter is in contact with an anode, at the same time scraping the metallic deposit from the drum, also simultaneously depositing other portions of the precious metals in the same bath upon a cathode of sodium amalgam, an electric current passing through anode, cathodes and bath and during third step of the operation.

PROCESS OF MAKING SMOKELESS POWER.—No. 640,213; H. Maxim and R. C. Schupphaus, New York, N. Y.

Pulping or reducing a pyroxyline to a fine state of division, then treating it with a solvent, and before it is completely freed from the solvent treating it with a size, then granulating and drying.

CANADIAN silver coins in Spokane and Sound cities pass at their par value, as does the American silver on the Canadian side of the boundary. Oregon and California banks discount Canadian bills 1% or 2%; a greater discount is made on silver, a Canadian quarter passing for 20 cents, a discount of 20%. Anywhere along the boundary line the silver coins of both countries pass on an equal footing, for there is very little difference in their value, and people keep crossing back and forth across the boundary.

A Water Wheel Plant.

The water wheel plant installed in the pumping station of the city of Columbus, Ohio, by the American Impulse Wheel Company of New York consists of two impulse water wheels, each direct connected to a Western Electric 120-light arc dynamo. The surplus capacity of the pumps supplying the city with water was used for furnishing water to the wheels at seventy pounds pressure. The high speed required for direct connection necessitated the use of wheel runners of very small diameter for the power furnished, six 18-inch runners being used in each unit with three nozzles to each runner, making eighteen nozzles in all.

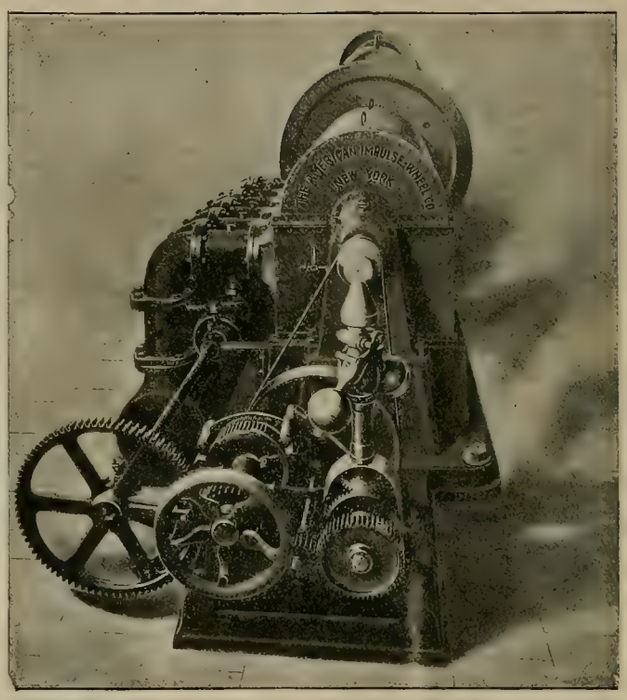
Fig. 1 shows the arrangement of receiver and piping for conveying the water to the six runners. The large number of nozzles precluded the use of contracting nozzles, because of their high cost and of the complicated gearing necessary for connecting them to the governor. Six butterfly valves, one to each runner, were accordingly used, and the effect of the low efficiency of a partly closed butterfly valve in reducing the total efficiency of the machine was neutralized in the following manner:

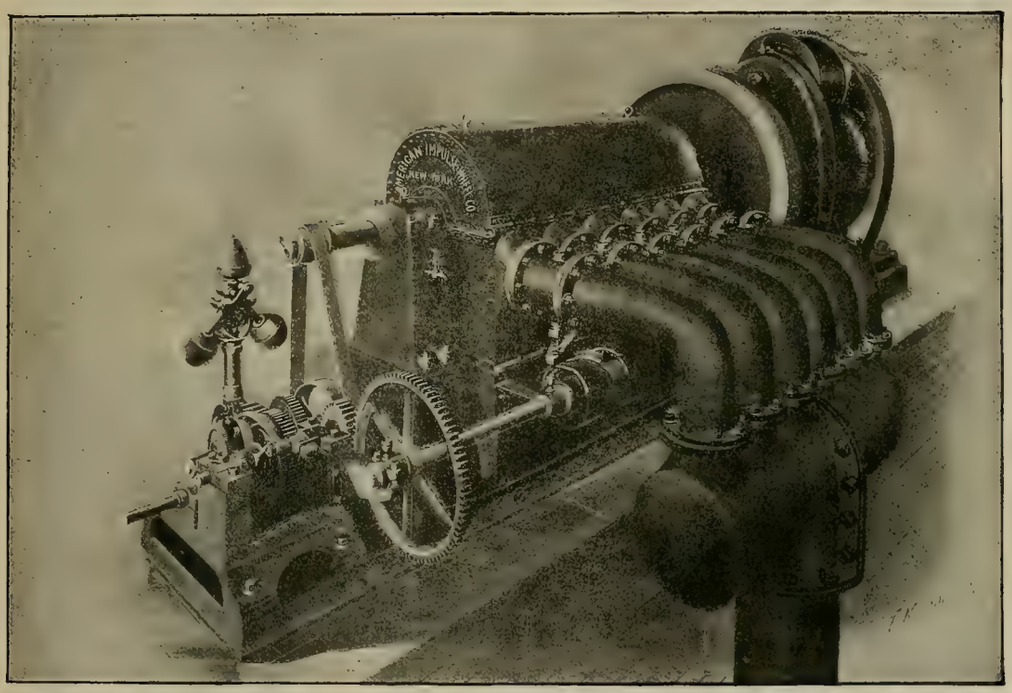
As shown in Fig. 1, six cams were so arranged on a shaft connected by a gear to the governor as to close the valves one after the other, each valve remaining wide open until the next preceding valve is completely closed. Thus only one of the six valves is partly closed at any time, all the others either being entirely closed or entirely open. There are thus six valves of the load giving a maximum jet efficiency and all of the valves in action, except one, are always working at their maximum efficiency. The strict speed regulation requirements and the small diameter of the runners made necessary the use of a heavy flywheel. The high speed precluded the use of the ordinary cast-iron flywheel and it was therefore made of a heavy steel rim shrunk onto a cast-iron web. A mechanical relay governor was used for actuating the cam mechanism.

The water chamber is cast in two pieces, and is connected to the valve chambers by means of long turn elbows, as shown in Fig. 1, the valve stems coming down through the bottom of the valve chambers and being connected to the cams by means of a lever arm and roller pin. The governor is placed on an extension of the cast iron base of the wheel, power for actuating the cam being derived from a small pulley on an extension of the wheel shaft. The wheel base was also extended at the other end to receive the dynamo, the whole plant being compact and self-contained, an arrangement rendered necessary by the very limited space available.

The base by which the nozzle chambers are also supported is of cast iron and is arranged to carry off all the water that may condense on the outside of the casing. The casing is of riveted boiler iron, built in two parts, bolted together, the upper part being provided with eye bolts for lifting. The bearings are ring oiling and spherical seated.

This plant has now been running for over a year, supplying light to the surrounding districts.





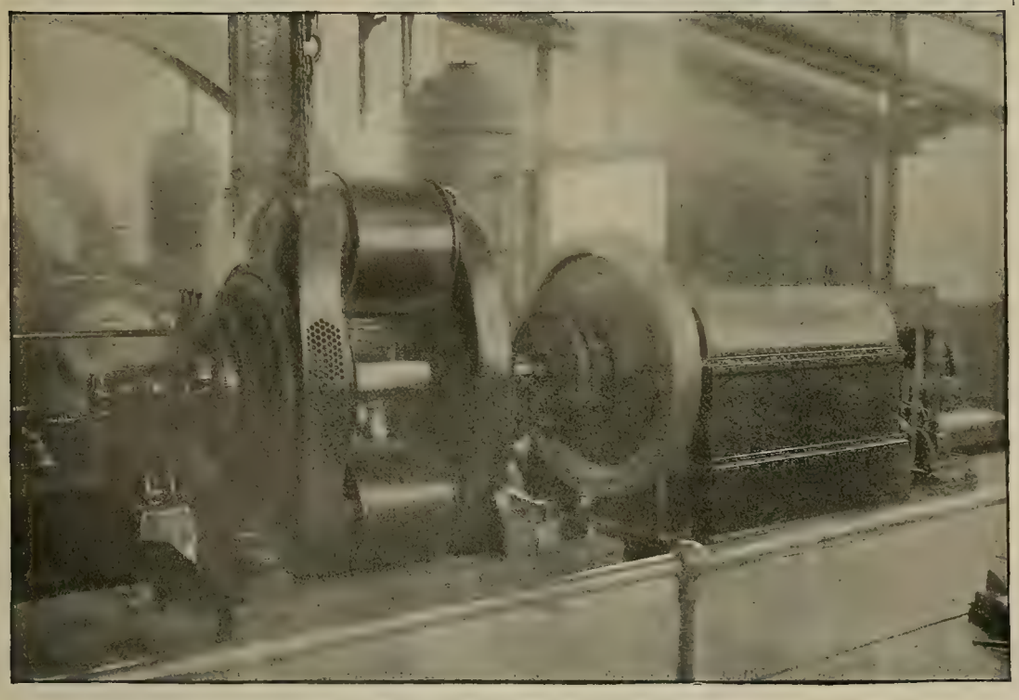


Fig. 1.—Arrangement of Receiver and Piping.

Water Wheel Plant Installed at Columbus, Ohio.

Price List of Leather Belting.

Following is the list on leather belting adopted by the Leather Belting Manufacturers' Association at their last annual meeting, held in New York City:

Width, inches.	Price per ft.	Width, inches.	Price per ft.	Width, inches.	Price per ft.
½	$0 8	5½	$1 01	23	$4 26
⅝	10	6	1 11	24	4 44
¾	12	6½	1 20	25	4 63
⅞	13	7	1 30	26	4 81
1	14	8	1 48	27	5 00
1¼	19	9	1 67	28	5 18
1½	24	10	1 85	30	5 55
1¾	20	11	2 04	32	5 92
2	34	12	2 22	34	6 29

Silver-Manganiferous Iron Ore.

Statistics regarding the production of manganiferous iron ores in Leadville, Colo., are given in Charles D. Wolcott's report on the production of metals, as Director of the United States Geological Snrvey.

A distinctive schedule shows the production of manganiferous iron carrying silver of over seven ounces per ton, which is shipped to the smelters, and the manganiferous iron ore containing less than seven ounces of silver, which is shipped to Pueblo or Chicago, where it is used in the manufacture of Bessemer steel. The mining of manganiferous or non-silver bearing iron ore, began in 1890, when 2075 tons were shipped to Chicago. The production grew steadily until, in 1898, the output is given at 18,848 tons. In the same nine years, beginning with 1889 and ending with 1898, the amount of argentiferous, or silver-bearing manganiferous iron, increased in production at Leadville from 64,987 to 99,651 tons. For the mining of manganiferous iron it should not contain more than $\frac{55}{1000}$ of 1% of phosphorous, as a greater amount than that is detrimental in the manufacture of steel, and the companies who purchase it will tax the purchaser 1 cent for every one-thousandth of 1% of phosphorous it carries in excess of that amount.

Mine Ventilation.

No problem with which the miner has to contend is of greater importance than that of ventilation, and in many cases too little attention is given the matter, either theoretically or practically.

The following remarks are condensed from a paper written by James Grant of Victoria and published in the Australian Mining Standard:

As long as bad ventilation was a mining question the world bore it with resignation as something unavoidable. But when it was found that the railway tunnels, through which the public had to travel, were badly ventilated—some of them being dangerous to human life—it became a different question altogether.

There are three methods employed—natural ventilation, furnace ventilation, and machine ventilation, either plenum or exhaust. Natural ventilation depends upon the inequality of weight betwixt two columns of air, the heavier of which displaces the latter. This is exemplified in the action of chimneys and in the ventilation of dwellings, and its efficiency is affected by friction in the airways. In mines it is very effective in level free workings where a tunnel connects with a shaft or winze on a vein; but where mines have to be wrought by deep shafts it is not so reliable. There the motive power, inequality of height in the air columns, being usually very little, and the extent of rubbing surface creating friction being very great, causes the current to be feeble and unreliable, and as a result the mine is badly ventilated. This is especially the case where carbon dioxide is the prevailing impurity, which stagnates on the floors of the mines and in winzes, even when a current exists. The stagnation of carbon dioxide is caused by the absence of any force corresponding to solar radiation on the surface of the earth.

In a deep mine the high temperatures and humidity that prevail are very prejudicial to ventilation. Besides the actual carbon dioxide, the displacement and rarefaction of the pure air constituents may cause a much greater deficiency of oxygen than is owing to the excess of carbon dioxide alone; and the nearer the temperature rises to that of blood heat the less readily will the respired air from the lungs rise and flow away with any current that may exist. A common temperature in badly ventilated deep mines is 90° Fahr., or thereabouts.

The cooler the incoming surface air is the more readily will the noxious gases evolved flow away; but when the pure air is heated to a high degree the noxious gases lose their comparative buoyancy, and, sinking down, become stagnant. This was found out at an early period, and furnace ventilation was introduced on the continent centuries ago to remedy it.

Fan ventilation was also introduced in Germany in the year 1621, but the early efforts in that direction do not seem to have been satisfactory. Furnace ventilation is capable of being made effective from a very great depth, but there should be two shafts to ensure the greatest efficiency. However, this method of ventilation can never be satisfactory in gold mines, owing to the cost of fuel. It was held by Atkinson and other eminent mine engineers in England that the furnace was superior to the fan as a ventilating agent, especially at depths below 900 yards.

There is one form of furnace ventilation sometimes spoken of as being exceptionally clever, namely, to run an air pipe under the grate of a steam boiler, closing the ash pit thoroughly. This is considered to kill two birds with one stone—to ventilate the mine and get up steam. This was introduced at the Chicago water works in 1867 to ventilate the tunnel that goes under Lake Michigan. There were sixteen to eighteen men employed in each shift—no blasting—and some mules kept below. The smoke from the candles, the respired air, with the perspiration from the men and mules, formed a mist so thick that the engineers could not see to align the tunnel in working hours, although after a Sunday's or holiday's spell the air got so clear that the light of a candle could be distinctly seen at a distance of 2000 feet. A fan was ultimately installed and an engine erected to drive it. The former is the most stupid method of ventilation I know of. It ought—in contradistinction to the terms natural and forced draught—to be called strangled draught, for the beauty of it is that the friction in the air pipe acts in opposition to the draught in the chimney, and you have only to make the air pipe long enough to stop all draught whatsoever as effectually as a damper would.

Another plan is to employ a jet of compressed air, as is done with the exhaust steam in locomotives. This was tried by General Morin, the French ventilating engineer, with an efficiency of $\frac{1}{28}$ of the theoretic power of the jet of air, or, taking the efficiency of the compressed air at 50% of the steam power, 1.78% of the actual force of the steam. Jets of steam and water have also a low efficiency. We may, then, take fans as the most efficient ventilators. Some of them are credited with over 70% of efficiency. But there is a great misapprehension as to the respective merits of various fans or blowers as ventilators. It is not the fan or other agent that ventilates, but the current of air induced. One fan or blower may be more effective or economical than another, but the currents of air induced will—velocity and volume being equal—be exactly the same. If a current of air induced by one agent does not give satisfaction, no current of the same volume and velocity induced by any other type of agent will make any difference; a remedy must be sought in another direction. Another misapprehension that exists is that the current of pure air will drive the foul air out of the mine before it. That is a mistake. What a current of pure air does in a space filled with foul air is to make a bee line through it to the nearest avenue of escape, carrying a portion of the impurity with it—but only a portion, so that, as one practical observer said apropos of the trials of the Massie scheme, "it takes the best air out of the mine." It just acts as a river would do—floats along material lighter than itself, and scours out a portion of the heavier material with which it comes in contact. That this is its action is indisputably shown by an observation made by Prof. Mica Smith at the Beaconsfield mine when all the men were driven out by foul air. The air issuing from the exhaust showed by analysis 1.07% of carbon dioxide. If we suppose the average proportion of carbon dioxide in the mine air to have been 3%, then the current of pure air must have taken up about one-half of its volume of the dense foul air of the mine, which I consider to be very good work indeed.

Another proof lies in the fact that in many mines the air is never clear of smoke from week's end to week's end, like the Chicago tunnel. But on Sunday it all clears out, and on Monday morning the air is perfectly clear. That is because in the working time the impurity is added to as fast as it is being removed, so that there is no real improvement; but on Sunday the production is stopped, while the work of purification is still going on. In the British coal mines the reason given for only working two shifts was that unless the mines got a spell during the third possible shift they would become unworkable, which indicates an excess accumulation of carbon dioxide in working hours. Coal miners assume that because a current of air takes out firedamp effectively it will also take out carbon dioxide as well, but that is a fallacy which has been proven indisputably in the ventilation of railway tunnels. For in these, although currents of air calculated to clear out all the gases of combustion have been passed through, they have failed to have the desired effect. The reason is obvious. The great bulk of the pure air passed along the upper part of the tunnel, taking with it only a portion of the noxious gases, as noted in the case of the Beaconsfield mine, leaving the remainder lying on the floor of the tunnel. Prof. Mica Smith notes a similar occurrence in his report on the Allendale mines. A thorough draft had been established between two shafts in one mine, and two mines had been connected, yet in neither case was there any improvement, although the current was so strong as to render it difficult to keep the candles burning. This may seem incredible, yet it is quite consistent with what I have pointed out in the comparison of air respired from the lungs and mine air of high temperature. It is possible that in summer the fresh air at a high temperature may pass over the foul air in the mines and leave it practically unchanged. There is no doubt that is the case with many mines at the present time, the small quantity of fresh air forced in being insufficient to do more than keep the proportion of impurity in a state of statu quo. Even when the noxious gas is diffused through the current of air it does not follow that it will be carried along as buoyant material would be carried by a current of water.

Construction of an Upraise.

Written for the MINING AND SCIENTIFIC PRESS by F. SLETCHER.

A rather peculiar 450-foot upraise in the Summit mine, the property of the Marina Marsicano G. M. Co., in Shasta county, Cal., was recently completed by Mr. L. F. Barlow, contractor, a description of which may be interesting to those of your readers who are operating power drills and conduct underground mining generally:

The croppings of the Summit vein trend along the east side of the crest of a ridge at an altitude of about 2200 feet. The course of the vein is nearly north and south, dip 80° east. The predominating country rock is apparently a hard, tough, diabase, schistose in places, and often resembling chert.

The principal workings of former owners consisted of a crosscut tunnel (adit), 200 feet in length, driven to the vein from the east. The ore body intersected was found to extend some 400 linear feet north and nearly 100 feet high. The pay ore extracted occurred in kidneys of base ochre (red brown oxide of iron) ore, and yielded at reduction works shipped to at the rate of $290 in gold per ton.

The present owners intersected the vein with a lower tunnel 1100 feet long—some 128 feet north (horizontally) of and 319 feet lower (perpendicularly) than the upper old tunnel. Levels were then run on the vein north and south, showing fairly good walls from 3 feet to 9 feet apart, still containing similar ochre ore as above. One hundred and ninety feet north of where the lower tunnel intersects the vein a small but high-grade ore body was stoped for 30 feet in height, being apparently a sectional continuation of the ore met in the upper tunnel. For this and other obvious reasons it was determined to begin a working raise here on the vein and connect it with where the upper tunnel intersects the vein—a linear angle (north and south) of 45° (451 feet), and lateral angle (east and west) of 80° (56 feet).

Mr. Barlow accepted the contract and completed the raise in sixty-five working days, at the rate of 7 feet per twenty-four hours, with eighteen men employed in eight-hour shifts.

From the dump to the foot of the raise is nearly 1500 feet, over a T-rail track, cars run by hand.

A station was cut at the foot of the raise and provided with a rock bin and chute, from which the car was loaded. The raise is 6 feet high by 7½ feet wide, separated into a 3x6-foot and 4½x6-foot compartment, the two being divided by a strong post every 5 feet, to which lagging were nailed inside of the 3-foot dumping compartment. In the 4½x6-foot compartment is an 18-inch track of T rails, on which a truck conveyed materials, tools and machine to the face (head) of the raise, where a ½-inch wire rope ran over a single block hitched to a cross timber, being operated by a 6x8 compressed air hoist at the station. In the same compartment were also an 8-inch galvanized air pipe, two 2-inch pipes carrying compressed air to the 2¾-inch drill machine, and a ¾-inch pipe conducting water under 350 feet pressure to clean drill holes.

At the mouth of the lower tunnel a boiler furnished steam for all the motive machinery, consisting of: A two-pipe air compressor having an 8-inch air cylinder with 9-inch stroke, making eighty revolutions per minute.

The distinctive peculiarity of the double-pipe compressed air system is that it requires two pipes to conduct the air to and from the drill machine.

Mr. Barlow, who has had considerable practical experience in machine drilling, prefers the double-pipe system to any other he is conversant with, on account of its reliability and ease in operating, saving not less than 30% power, of less weight and requiring less space, and less cost of plant. He asserts that cost, placing and keeping in order the extra small pipe is too insignificant to compare with the numerous economical advantages obtained by the two-pipe system.

The additional machinery were a 6 H. P. engine driving a blower for smoke-expelling purposes, carrying the air in an 8-inch pipe continuously; a small duplex steam pump, elevating the tunnel water 350 feet high to a tank on the hillside above, from which a ¾-inch pipe connected, through the tunnel, with the raise, where the water was utilized to clean drill holes.

Three-fourths of a cord of oak wood per twenty-four hours was used to produce steam for all purposes.

Ten holes, 4 feet deep each, consuming thirty pounds of No. 2 giant powder, generally constituted a round, the broken rock descending, through the dumping compartment of the raise, to the rock bin at the station by gravity.

Colorado Coal Statistics for 1899.

Specially Prepared for the MINING AND SCIENTIFIC PRESS by HARRY A. LEE, Commissioner of Mines for Colorado.

BRIEF STATISTICS, 1899.

Number of mines in operation	88
Total tonnage of coal produced	4,806,879
Number of men employed	7,321
Number of fatal accidents	41
Number of men employed for each life lost	178
Tons of coal mined for each life lost	117,241
Number of non-fatal accidents	97
Number of men employed for each non-fatal accident	75
Tons of coal mined for each non-fatal accident	49,555

PRODUCTION BY COUNTIES, SHOWING INCREASE AND DECREASE.

Counties.	1898.	1899.

Quicksilver Recovery from Greasy Refuse.

Written for the MINING AND SCIENTIFIC PRESS by D. B. HUNTLEY.

In cleaning up the old DeLamar pan amalgamating mill a year ago, the management had a peculiar experience which is given for the benefit of others who may face similar conditions.

Under the pan line shaft there had accumulated piles of dirty grease, the drippings of oil from the pan shaft and line shaft bearings and of compound from the pan-driving spur gear. This grease was full of small globules of quicksilver from leaking pan bottoms above. Every old-time mill man has seen such a combination, much to his disgust.

The accumulations of this material for eight years under twenty-eight pans were of so large an amount that some method of treatment had to be devised. The richer parts of the greasy mass contained 10% to 40% of quicksilver and assayed hundreds of dollars per ton in gold and silver. No smelter would treat it, not caring to salivate their employes.

After several unsuccessful attempts to handle portions of this mass, the following course was adopted: The least greasy or poorer portion of the slime collected under the pans was dumped into a settler, the muller being kept in motion and a large stream of water running in and out. The muller was raised as found necessary to accommodate the increasing layer of heavy sand, etc., at the bottom, while the light slime and some of the free oil floated away.

The entire bulk of mud, sand, grease and quicksilver thus concentrated was wheeled to a patch of hard ground in the mill yard and allowed to sun dry for some weeks. It was then put through a screen of 1-inch mesh which separated the large lumps of grease, and by mixing the moist grease with the sand and mud it became lumpy enough to be easily handled. The lumps were stored in boxes. The fine material was again sun dried and screened through a ¼-inch mesh screen, being beaten and rubbed on the screen to get rid of all the sand possible. The small, greasy lumps were added to that already stored in boxes.

The sand that passed through the ¼-inch mesh screen was washed over 16 feet of ordinary silver-plated copper plates which caught the quicksilver and amalgam. It seemed very queer to a mill man to see the mixture of oil, grease and muddy water running over copper plates, and see drops of quicksilver and specks of amalgam catching easily on the plate; but they did so. It was found better to clean off the plates every half or three-quarters of an hour with a rubber, as is usual in gold mills, and then to give them a mopping with lye or cyanide solution. We used both without notably different results. The quicksilver ran down the copper plates, keeping them very "wet," and dropped off at the lower edge where it was caught in tight riffles. After passing over the plates the sand was found to be free from quicksilver and amalgam, but the very small, greasy lumps still contained a considerable value. This mixture of sand and greasy lumps could not be handled in an amalgamating pan with a large quantity of lye added. That was tried, without other result than to aggregate some small lumps into larger ones and to enrich them from the quicksilver employed. Having no roasting furnace, this fine material was therefore allowed to go to waste. Many hundred pounds of quicksilver and considerable amalgam were secured cheaply and quickly by a simple washing of the sand over copper plates as above described.

The boxes of greasy lumps were burned in a rude improvised furnace. Some old castings were used to make a semi-circular furnace 4 feet in radius and 6 feet long. Old grate bars were used and the ends bricked up, leaving space for one small feed and ash door at one end and one 8-inch smoke pipe at the other. The 8-inch galvanized-iron smoke pipe ran horizontally for about 25 feet and then entered an old sheet-iron drum 3 feet in diameter by 10 feet long, for a condensing chamber. A spray of water from an adjacent creek kept the condensing chamber and the horizontal 8-inch pipe cool. A fire of wood splinters and charcoal was made on the grate bars, and then lumps of the greasy material, perhaps seventy-five pounds at a time, scattered over the fire. The oil burned out; the quicksilver volatilized and much of it condensed in the pipe, and the rich, burned-out lumps of sand dropped through the grate bars into the ash pit. One laborer attended the furnace and usually burned 500 pounds per day. The laborers employed here were paid extra, were furnished with a respirator and changed works with others each two days, to keep from becoming salivated. (It has been a general rule of this place that salivated mill men were given work as carmen in some hot place in the mine and profuse perspiration soon made them in good form again.)

The ashes and several tons of sand from this rude furnace were screened and hand-sorted to separate the copper rivets, bolts, pebbles, etc., and shipped to smelters where it netted $900 to $1200 per ton in gold and silver. A few hundred pounds of deformed copper rivets and burrs were thus collected for sale to copper smelting works.

The quicksilver did not condense in the rude condenser to liquid quicksilver. It deposited more on the walls of the pipe than in the entire condensing chamber. It was in thick crusts or layers of greasy masses, 1 to 2 inches thick of minute quicksilver globules mixed with soot from the smoky fire. This, I suppose, is the "stupp" of the quicksilver metallurgists. Thousands of pounds of this "stupp" accumulated and was stored in cast-iron boxes. The condenser pipe required cleaning every two or three days. We had much trouble reducing the greasy "stupp" to clean liquid quicksilver. We tried agitation with acids, lye and lime without success. Finally it was retorted in large silver-mill retorts. These treated it successfully. A small percentage of greasy quicksilver globules that passed through the retort had to be re-retorted. The black, sooty residue from the retort was bulky and very light. It assayed about $500 in gold and silver and was sold to smelters with the sand. In the above way about eighty flasks of quicksilver were recovered, while doubtless a considerable percentage escaped condensation. The above metallurgical treatment was very wasteful, yet probably a more expensive condensing plant, counting the cost of such a plant, would not have yielded the net profit that was secured.

Views in Esmeralda County, Nevada.

In such rude ways as above mentioned the cleanup of the DeLamar mill, outside of the pans and settlers, secured a total of 8160 pounds of quicksilver, 24¾ tons of sand and 1866 1/10 ounces of gold and silver bullion, at a cost of $3731.18 and which realized a profit of $20,837.84.

Tungsten and Molybdenum Steel.

Steel alloyed with a small proportion of tungsten has been used for some years in the manufacture of tools and other articles requiring a hard and tough metal. Some years ago Prof. V. Leepin of St. Petersburg, Russia, suggested that molybdenum might be used for the same purpose, as it strongly resembles tungsten in its properties. After some discussion he succeeded in having molybdenum steel made at the Pubilov Iron Works, and carried on a number of tests, the results of which were published in the Russian Mining Journal for 1897. In making these tests great pains were taken to have the steel, both tungsten and molybdenum, made under the same conditions. Both steels were made in Siemens regenerative furnaces from a charge consisting for the molybdenum steel of 20.6 kilograms of basic open-hearth steel, 2 kilograms Swedish charcoal pig iron, 2.3 kilograms Swedish charcoal blooms, 0.1 kilogram ferro-silicon, and 1 kilogram molybdenum in a metallic form, but combined with a small quantity of carbon. For the tungsten steel the charge consisted of 16 kilograms basic open-hearth steel, 3.7 kilograms Swedish pig iron, 2.9 kilograms Swedish charcoal blooms, 0.1 kilogram ferro-silicon, and 1.8 kilograms ferro-tungsten having 48% tungsten. Both steels were cast into ingots, which were afterwards rolled into rods of a suitable size for the testing machine. By analysis the percentage of tungsten was found to be 3.8 and that of molybdenum 3.7.

The experiment showed that the molybdenum steel is somewhat softer than the tungsten steel. Oil tempering and high heating after hardening increased the limit of elasticity in the molybdenum steel. Common tempering in oil has a greater influence on the tungsten steel than on the molybdenum, but, on the other hand, the molybdenum steel was stronger than the tungsten after heating and hardening in water. Tungsten steel was more apt to split than the other when worked, and broke sooner when bent cold.

In many respects the properties of the two kinds of steel were very similar, but the molybdenum steel seems to stand forging and hardening better, showing that in some cases it may furnish a better metal than the tungsten steel.

We have heretofore referred to the use of molybdenum, tungsten and some other of the rarer metals in the processes for making armor plate at the Krupp works in Germany and the Creusot works in France. At both these establishments the alloys are kept secret, but it is probable that a mixture of several of the rarer metals is used, including both tungsten and molybdenum.—Journal Franklin Institute.

In the Great Basin.

Mining has been the principal industry in that vast region lying between the Rocky mountains and the Sierra Nevada called the Great Basin. The name is somewhat misleading, as the high plateau country lying between these two great ranges of mountains is scarred by numerous mountain ranges, between which lie fertile valleys or wood and plains; but nearly every hill is the site of a prospector's hopes, and some of the greatest mines of the West have been developed in this wilderness of rugged hills and alkali flats.

Esmeralda county, in western Nevada, is typical of the region as a whole, and the accompanying illustration conveys an idea of the appearance of the country. In this county mining brought about the settlement of the county and is still the chief industry. At one time it was a noted silver producer, but, with the decline of the white metal, gold mining grew more active and many veins have been discovered and developed. The Silver Peak district is one of the most noted in the county. There are found veins 100 feet and more in width containing good values, but the property lies idle, owing to litigation.

Recently attention has been attracted to Esmeralda by reason of the discovery of new gold ledges and also of large copper deposits near Hawthorne. These are being developed and the outlook for a revival of mining in Esmeralda county looks promising.

A RECENT amendment to the mining law of British Columbia provides that the owners, agents or managers of every mine shall make yearly returns to the Bureau of Mines of the quantity of metal or ore wrought in their properties, and the number of persons employed above and below ground. The individual returns will not be published by the department without the consent of the owners, nor will the figures be available to the public save in the aggregate as given in the departmental publications, the information being intended for statistical purposes only. A maximum fine of $100 may be imposed for failure to comply with these regulations.

MINING SUMMARY.

Precious Metal Product for 1899.

ANNUAL PRODUCTS OF LEAD, COPPER, SILVER AND GOLD IN THE STATES AND TERRITORIES WEST OF THE MISSOURI RIVER, INCLUDING BRITISH COLUMBIA AND YUKON TERRITORY, 1870-1899.

YEAR.	Product as per W. F. & Co. statements, including amounts from British Columbia and west coast of Mexico.	Product after deducting amounts from British Columbia and west coast of Mexico.	The Net Products of the States and Territories West of the Missouri River, Exclusive of British Columbia and Yukon Territory, Divided, are as follows:			
			LEAD.	COPPER.	SILVER.	GOLD.
1870	$ 54,000,000	$ 52,150,000	$ 1,080,000	.....	$17,320,000	$33,750,000
1871	58,284,000	55,784 000	2,100,000	.....	19,286,000	34,398,000
1872	62,236,950	60,351,824	2,250,000	.....	19,924,429	38,177,395
1873	72,258,698	70,139,860	3,450 000	.....	27,483 302	39,206,558
1874	74,401,045	71,965,610	3,800,000	.....	29,600,122	38,466,488
1875	80,889,057	76,703,433	5,100,000	.....	31,635,239	39,968,194
1876	90,875,173	87,219,850	5,040,000	.....	39,292,924	42,886,035
1877	98,421,754	95,811,582	5,085,250	.....	45,846,109	44,880,223

The exports of silver during the past year to Japan, China, the Straits, etc., have been as follows: From London, $33,923,252; from San Francisco, $5,963,543; total, $39,886,795, as against $32,622,032 last year. Pounds sterling estimated at $4.8665.

STATES AND TERRITORIES.	Gold Dust and Bullion.	Silver Bullion by Express.	Ores and Base Bullion by Freight.	Total.
California	$15,391,498	$315,304	$3,246,315	$18,953,117
Nevada	2,294,343	600,672	14,400	2,909,415
Oregon	1,780,910	75,423	3,560	1,859,893
Washington	380,840	175,200	73,125	609,165
Alaska	4,645,646	.....	195,200	4,740,846
Idaho	2,495,210	4,235,150	6,006,500	12,736,860
Montana	5,187,500	8,725,000	36,802,500	50,695,000
Utah	3,681,407	132,775	9,950,500	13,654,682
Colorado	26,348,050	13,344,596	3,488,267	43,180,913
New Mexico	674,612	100,262	1,543,084	2,317,958
Arizona	2,965,160	739,113	16,659,148	20,363,421
South Dakota	6,750,000	250,720	46,000	7,046,720
Texas	3,100	290,200	.....	293,300
Wyoming	208,950	23,600	85,126	317,676
Br. Columbia and Yukon Ter'y	17,622,941	4,210,000	2,030,000	23,862,941
Totals	$90,190,167	$33,208,015	$80,143,725	$203,541,907

The gross yield for 1899, as shown above, segregated, is approximately as follows:

Gold	44 31-100	$ 90,190,167
Silver	19 7-100	38,804,498
Copper	29 11-100	59,244,994
Lead	7 51-100	15,302,248
Total		$203,541,907

MEXICO.

STATEMENT OF THE PRODUCT OF GOLD AND SILVER IN THE REPUBLIC OF MEXICO, REVISED AND CORRECTED FROM 1877 TO 1899.—VALUES UPON MINTAGE BASIS.

Years.	Gold.	Silver.	Total.
1877-1878	$747,000	$24,837,000	$25 584,000
1878-1879	881,000	25,125,000	26,006,000
1879-1880	942,000	26,800,000	27 742,000
1880-1881	1,013,000	29,234,000	30,247,000
1881-1882	937,000	29.329,000	30,266,000
1882-1883	956,000	29,569,000	30,525,000
1883-1884	1,055,000	31,695,000	32,750,000
1884-1885	914,000	33,226,000	34,140,000
1885-1886	1,026,000	34,112,000	35,138,000

SUMMARY.—Totals: Gold, $13,189,655; silver, $618,488,873; copper, $203,296; grand total, $631,881,824.

EXHIBIT OF THE COINAGE OF MEXICO FROM THE ESTABLISHMENT OF THE MINTS IN 1537 TO THE END OF THE FISCAL YEAR OF 1899.

COLONIAL EPOCH.	GOLD.	SILVER.	COPPER.	TOTAL.
Unmilled coin from 1537 to 1731	$ 8,497,850	$752,067,456	$200,000	$760,765,406
Pillar coin, 1732 to 1771	19,889,014	441,629,211	.....	461,518 225
Bust coin, 1772 to 1821	40,391,447	888,563,989	342,893	929,298,328
INDEPENDENCE.	$68,778,411	$2,082,260,656	$542,893	$2,151,581,960
Iturbide's imperial bust, from 1822 to 1823	$ 557,392	$ 18,575,569	.....	$ 19,132,961
Republic eagle, 1824 to June 30, 1873	45,040,628	740,246,485	$5,235,177	790,522,290
REPUBLIC.	$45,598,020	$758,822,054	$5,235,177	$809,655,251
Eagle coin, from July 1, 1873, to June 30, 1899	$13,189,655	$618,488,873	$203,296	$631,881,824

SUMMARY.—Colonial Epoch, from 1537 to 1821, $2,151,581,960; Independence, from 1822 to 1873, $809,655,251; Republic, from 1873 to 1899, $631,881,824; total, $3,593,119,035.

ARIZONA.

MARICOPA COUNTY.

Placer gold is reported discovered in the bed of the Arizona canal on the Indian reservation east of Phœnix.

YAVAPAI COUNTY.

J. C. Baumann of Prescott is developing copper claims at Swiss Girl camp with a diamond drill three miles from the Agua Fria river and fourteen miles in an air line from the United Verde.

Courier: The Octave M. Co., three-quarters of a mile from Weaver, is grading for a 40-stamp mill. Sinking on Genung's Leviathan group is in progress. A bucket tramway will be put in between the Johnson mine and the mill.

ALASKA.

The conditions between capital and labor at Cape Nome are peculiar. The beach diggers claim that the transportation companies which own the mines on the higher slopes are trying to get Congress to give them possession of the beach. The tide sands, up to 16 feet above high water mark, may not be taken up for ordinary mining claims. The United States authorities have been giving them out to all comers at the rate of 50 feet per man; this has made possible the statement that Nome is a "poor man's camp." This condition of affairs has resulted in a great scarcity of labor. No one wants to go to work by the day as a hired miner when he can make more money cradling for himself on the beach. Consequently, the companies are said to be playing for the beach in order that the diggers may be thrown on the labor market.

CALIFORNIA.

ALAMEDA COUNTY.

A sampling plant at Oakland is talked of by the Puget Sound Reduction Co. of Everett, Wash.

CALAVERAS COUNTY.

At the Vorlander mine, at Middle Bar, a crosscut will be run from the 150-foot level to locate a place for a permanent working shaft. The quartz formation, composed of a series of veins, is about 200 feet in width, so this cut will be run in order to explore the different veins. The Prospect says when this is accomplished machinery will be installed and the company will prepare to go down 1000 feet.

EL DORADO COUNTY.

(Special Correspondence).—The Ribbon Rock and Superior (or old Tincup) mines have been bonded by E. A. Davis for Mr. Hayward, and twelve men are now employed. The past record of the old Tincup is first class as a bullion producer. The Minnehaha mine, near El Dorado, is now running a small mill, and the Supt. claims it is milling about $18 per ton in free gold. The Chapman & Parker mill, near Texas hill, is now nearly completed and will soon be in operation.

The Kohn & Kimball mill, south of Placerville, is running steadily and employing twenty-five men. The Poverty Point mill of fifteen stamps is running and the lessees claim to be doing well.

The Larkin mine is said to be looking well on the 600-foot level and the mill is running. Prof. Jacobs has superseded C. H. Dunton as Supt.

The Coalman mine, south of Mathenas creek, in clearing out the old works, exposed some fine ore, and the owners feel jubilant. The Selby mine has again closed down temporarily.

The big mill at the Blue Gouge will be ready for operations in about thirty days. The old Schnider mine, near Diamond Springs, is being operated by new owners, who claim 4 feet of $10 ore in the tunnel level and 400 feet of backs for stoping. A contract has been let to sink the shaft deeper on the Little Gem mine, at Volcano. Smart & Lane are operating the old Van mine, near Georgetown. The Vandelia mine, below Mud Springs, is cyaniding forty tons of ore per day and making a handsome profit. The Orofino mine, owned by Hayward & Lane, has been running thirty stamps satisfactorily.

Placerville, Jan. 11th, 1900.

HUMBOLDT COUNTY.

Supt. H. Lawrence of the Stone Lagoon M. Co. is prospecting the Lagoon bottom with a sand pump. The beach sand mines along the Lagoon are to be worked.

INYO COUNTY.

At Saline valley this week the Western Borax Co. is pushing work on its large new steam plant.

KERN COUNTY.

At a depth of 220 feet the Buckboard, near Randsburg, is working a 12-foot vein and shipping ore to Barstow.

Miner: The Slate Range Milling Co. are putting up a rotary mill near the new borax works at Borax lake, with a capacity of twenty-five tons a day. The mill is almost completed.

Land values are appreciating near Bakersfield because of oil strikes. It is only four months since the first standard rig was placed in operation in the field and now there are 100 at work day and night. The oil is found in a fine sand, through which it percolates and with which it has become so thoroughly mixed that the mixture will flow slowly. This sand is from 200 to 600 feet deep. The S. P. has surveyed a route for a branch line to run into Discovery to haul the products of this section. Some of the oil will go 70% lubricating, but its principal value is for fuel purposes, and its development means the partial solution of the fuel problem on this coast.

MADERA COUNTY.

The Coarse Gold Gulch M. Co. has organized at Coarse Gold. Capital stock, $100,000; subscribed, $500.

MARIPOSA COUNTY.

Coulterville reports the Mary Harrison mine temporarily closed down, except sinking in the main shaft.

The News Bureau hears that the Merced gold mine is earning above all construction $1.25 to $1.50 per share per annum. The annual stockholders' meeting of the company will be held at Butte, Mont., on the 24th inst.

NAPA COUNTY.

The following number of flasks of quicksilver were shipped from the mines in this county during December just closed: Ætna 305, Napa 450, Great Western 100, Mirabel 20, Vallejo 69, Sulphur Bank 37, H. B. Lawley 1; total 982, or a decrease of 253 flasks from the November shipment, which was unusually large.

Four California quicksilver mining companies in this county paid quarterly dividends this week as follows: Ætna, 10 cents, and 5 cents extra; Napa Con., 10 cents, and 10 cents extra; Boston, 10 cents; New Idria, 10 cents, and 10 cents extra.

NEVADA COUNTY.

The construction of a dam on the Truckee river for the General Electric Co. has begun a mile from Floriston, 200 feet long, 10 feet high.

Supt. Turner is about to resume development work at the Coe mine, near Grass Valley.

Union: In the new shaft at the La Suerte mine there is a 20-inch ledge at a depth of 100 feet. The incline will be continued to the 300-foot level before drifting begins. The ore is expected to mill at least $10 per ton.——The Excelsior Water Co. is having the wing dam on Deer creek rebuilt.

PLACER COUNTY.

At Gold Run the South Yuba ditch is running water to its fullest capacity and the Gold Run Gravels Co.'s ditch is full. The company is running two hydraulic pipes.

The Herald reports that J. E. Spencer, who has bonded the Crandall quartz mine for $30,000, will sink 500 feet.

The late heavy storm has put water in all the mountain ravines, and will furnish a good head for ground sluicing.

Peter Oest is developing a copper vein near Bear river. A ton of unassorted ore is reported to have yielded $40.

PLUMAS COUNTY.

R. R. Gumbert of the West Elizabeth M. Co. is at Johnsville, where a tunnel has been run 1535 feet and auriferous gravel has been tapped.

At La Porte the Claybank is in operation. The Yankee Hill mine is ready for work.

SAN BENITO COUNTY.

The Victor Gold, Copper and Cinnabar M. Co. has organized at Hollister. Capital stock, $125,000; subscribed, $75,000.

SAN BERNARDINO COUNTY.

A 40-stamp mill is to be built at the

group of gold mining claims at Gold Hill, recently bought by J. De Lamar.

SAN DIEGO COUNTY.

Mica has been discovered by W. E. Cook and W. Brenfleck near Mountain spring, five miles east of Jacumba, near the Colorado desert. Four claims have been staked. The ledge is about 30 feet wide.

SHASTA COUNTY.

At Bully Hill a large body of high grade ore has been found in the lower tunnel. The company is running a third tunnel to tap the ore body 200 feet deeper than the Salee lowest tunnel.

The Mammoth group of copper claims are reported bonded to-day to Nova Scotian and English investors for $103,000. Three thousand dollars is paid, $50,000 to be paid Feb. 10th, and $50,000 April 1st.

SISKIYOU COUNTY.

The Schroeder mine is being worked by fifteen men.

The high or dry gulch diggings are well supplied with water.

Dr. G. W. Dwinnell, of Montague, has located nine quartz claims in Gazelle district, under the requirements of the State and Federal laws, with a view towards procuring patents for the same. He has made the preliminary location under the State law supposed to be invalid, but not so decided yet by the Supreme Court, and will then file final notice after sixty days' time, and $50 worth of work. The claims have also been located under the U. S. laws, with the required Federal yearly assessment work. By this action the doubt about the validity of the State law will be overcome. If the State law is good, his locations will be all right, and if not, no harm will accrue to issuance of patents under the Federal laws.

The Journal learns that fifteen new quartz mills are to be shipped into Siskiyou county next spring and summer, and that this winter so far is one of the best ever known in Siskiyou county for successful mining.

The upper works of the dredger on Yreka creek, near Hawkinsville, are being constructed.

The Superior Court has rendered a judgment in favor of plaintiff for the sum of $25,000, in the case of W. C. Stanley vs. The Ock Co., the Wing Ching Leng Co. and the Lee Jack Co., on a written agreement for the promotion of a sale of certain mining property at Happy Camp, bonded for $75,000. The agreement was that Stanley should get $25,000, and Ock $50,000, but Ock acting independently at a later period, sold the property for $50,000. The property was disposed of on the report and maps made by Stanley. Defendant's counsel contended that Stanley had abandoned the undertaking before he found a purchaser, and was therefore not entitled to commission on a subsequent sale, and the defendant sought other assistance to effect a sale. The Court decided that Stanley continued his efforts under the agreement, and that it was an independent transaction, regardless of the claim that the sale was effected after the expiration of the bond, no time having been stipulated for making the sale.

TRINITY COUNTY.

At the Brown Bear mine at Deadwood the main tunnel is in over 2500 feet. The ledge is supposed to be about 1500 feet farther. The tunnel is driven about 7 feet a day and is expected to strike the ledge 340 feet below the lowest level of the mine, a total depth of over 800 feet. Should the tunnel strike the ledge and find pay rock the works will be moved to the mouth of Thorn gulch and the company will build a 20-stamp mill.

TUOLUMNE COUNTY.

The shaft at the Pauper's Dream is 290 feet deep and sinking continues.

Democrat: At the Mt. Jefferson preparations are being made to start the three compartment vertical shaft on hanging wall. This will be driven down 1000 feet, though it is expected to strike the vein at a depth of 500 feet. Supt. M. Meighan says he will have the new 10-stamp mill in operation by the 15th inst.

COLORADO.

In their annual summing up, the Denver Times puts the gold output of Colorado for 1899 at $35,081,516, silver $14,650,274; the Republican puts it at $33,000,000 gold, $15,500,000 silver; the News at $31,329,056 gold and $12,680,256 silver.

BOULDER COUNTY.

The values of the various minerals mined during the past year are as follows:

Gold	$523,170
Silver	47,934
Lead	500
Copper	2,537
Total	$574,141

CHAFFEE COUNTY.

At Granite placer miners have built a ditch nine miles long, costing over $100,000. The mine yields from $150,000 to $200,000 each season from April to November, and employs about 250 men.

At Winfield a smelter is completed.

The Gladstone mine, idle since '93, is now being worked.

The amount of ore shipped from all the different mines of the county is figured at 500,000 tons.

CLEAR CREEK COUNTY.

(Special Correspondence). — Contracts have been let to push work on the Pennsylvania tunnel. It starts in the mountain between north and south forks of Clear creek and will run toward Bald mountain. The work has progressed well and several lodes are said to have been cut.

The Fairmount, in Hukill gulch, worked steadily for a while, but it is now closed under a court injunction. Numerous mill runs made show values ranging from $21 to $125 per ton.

The Sun & Moon, on Seaton mountain, is now in charge of H. N. Sims. The Mynott shaft on this group, now 400 feet deep, is sinking to greater depth. Two other shafts were made on the group in former years.

The Anderson mill of ten stamps and two grinders is running steadily and averages about thirty tons per day. Values are saved on the plates and in concentrates. G. Carlson is in charge.

The Jackson mill, managed by J. G. Roberts, milled 13,000 tons of ore in 1899, reducing same to 2600 tons of concentrates. No amalgamating is done here, being purely a concentrator, and runs entirely as a custon mill.

The Shafter group, on Bellevue mountain, is shipping about 300 tons per month, all of which is milled. The main shaft is 700 feet deep, from which various levels reach the ore body. The work approximates 3000 feet. It is owned by a New York company, whose Mgr. is J. H. Shepherd.

Dr. Frank G. Carpenter, connected with mines and smelters of the Black Hills, S. D., has been investigating various properties in this county and may become interested.

The Freeland Extension, bought last year by Massachusetts parties, is being developed and equipped under the management of J. H. Le Moyne. Incidental to development work, about 100 tons of ore per month are being milled. The work is carried on through the old Freeland level. A new shaft is being sunk to tap the main level. Two carloads of machinery were recently shipped to the property. The ores carry gold, silver and copper.

A bond and lease on the Mayflower for three years has been acquired by J. H. Le Moyne. WASCOTT.

Idaho Springs, Jan. 3, 1900.

The county is credited with producing in 1899:

Gold	$666,080
Silver	959,636
Lead	254,468
Copper	43,117
Zinc	25,000
Total	$1,948,301

HINSDALE COUNTY.

The production of the county for '99 of all ores in tons was 7280, of a value of $728,000.

An enterprise during the past year has been the erection of the Golden Fleece mill. The Golden Fleece has paid a monthly dividend of $18,000 for over two years. The Golden Fleece people are running a long tunnel to cut their ore bodies; and when connections with the old workings are made, the Golden Fleece ore will only have to be hauled half a mile. At present the company is leasing a good portion of their ground, and each leaser is averaging from $150 to $200 per month.

LAKE COUNTY.

During '99 the county produced:

Gold	$2,257,018
Silver	4,200,000
Lead	1,554,494
Copper	967,666
Manganiferous iron and zinc	500,000
Total	$9,479,178

PITKIN COUNTY.

The Denver News credits Pitkin county with a gold production of $67,419 during '99. Other values were: Silver, $2,200,922; copper, $700; lead, $605,957. Total mineral output, $2,874,998. The tonnage to produce these values, excepting the gold, is given as 185,000. The figures were obtained from smelters and reduction works.

PUEBLO COUNTY.

The output of Pueblo's three smelters for '99 was as follows:

Gold, oz	405,907	$ 8,390,097 69
Silver, oz	13,713,859	8,174,831 35
Copper, lbs	7,356,613	1,239,589 29
Lead, lbs	115,698,735	4,935,708 08
Total		$22,740,226 37

SAN JUAN COUNTY.

The mineral production of San Juan county for 1899 was:

Gold	$1,500,000
Silver	710,591
Lead	657,000
Copper	170,000
Total	$3,037,571

SAN MIGUEL COUNTY.

The cyanide plant of the St. Louis Gold Recovery Co., at Gold Run placers, has begun the treatment of 100 tons tailings daily.

The estimates for the Tomboy and Smuggler-Union place the '99 output for each of these properties at between $600,000 and $700,000 respectively.

SUMMIT COUNTY.

Summit county's production for last year is given at:

Gold	$430,000
Silver	266,350
Lead	212,972
Copper	2,224
Total	$911,546

TELLER COUNTY.

According to the Post, the Isabella, at Cripple Creek, will make no more extraordinary shipments of high-grade ore, but will take the average as it runs in the vein and let it go at that. They have experienced some trouble in settling with the smelters on their very rich consignments, and also with the railroads, which object to hauling ore worth $8000 per ton at the same rate charged for carloads of medium grade. It is said that in the tenth level the miners are now breaking 5 feet of stuff that will average, without sorting, from thirty to fifty ounces gold per ton.

IDAHO.

There have been a number of inquiries made of the Attorney-General as to the fee for recording affidavits of annual work on mining claims when an affidavit covers more than one claim. Some of the recorders have been demanding 50 cents for each claim. The Attorney-General, in response to an inquiry from the Recorder of Elmore county, says: "Replying to your question as to what the legal fee is for recording affidavits of annual labor, I will say that the statute seems to provide that the fee shall be 50 cents and no more. There is no reason why the affidavit may not cover more than one claim, and I find no authority in such case for a greater charge than 50 cents."

The Helena-Frisco Co. of Montana has sold the Helena-Frisco mine on Canyon creek to the Frisco Con. M. Co., Ltd., organized under the laws of New Jersey, capital stock $2,500,000. The action of the Helena-Frisco stockholders completes the consolidation of the Helena-Frisco, the Black Bear, Gem and Galena mines, and makes the biggest mining corporation in the Cœur d'Alenes. Joseph McDonald, Mgr. Helena-Frisco, will be Mgr. of the consolidated company. The Helena-Frisco represents a little more than one-half of the new company. About $1,200,000 will be paid for the Black Bear, on which $200,000 has just been paid, and the Galena and Gem.

BLAINE COUNTY.

Hailey Times: J. R. Blackhart has leased to the Cœsus M. Co. for five years, with the privilege of ten, 30 inches of the waters of a spring on his ranch for $25 cash in hand and $150 a year, payable "the 11th day of each year."

OWYHEE COUNTY.

In Aug., '99, Mgrs. Huntley of the De Lamar and Hutchinson of the Florida Mountain, made a wager as to which set of men would make the greater progress during the remainder of the year, the two tunnels on Sept. 1st being each in about the same distance, 250 feet. Mgr. Huntley's men won. Work was prosecuted from Sept. 1st to Dec. 31st. Total time of operation 120 days. Monthly progress was as follows: Sept., 279 feet; Oct., 389 feet, and 6 feet for a powder thawing crosscut; Nov., 402 feet; Dec., 436 feet. Total, 1512 feet. Average progress per 24 hours for four months, 12.6 feet; average progress per 24 hours for Oct., Nov. and Dec., 13.54 feet; average daily progress for Nov. and Dec., 13.96 feet; average daily progress for Dec., 14.5 feet. The size of the tunnel is 7½x7 feet wide. The formation is a black basalt, at times for over a week having bands of very hard, short, tough, seamy ground, standing on edge. The best three weeks records are 107, 110½ and 120½ feet; the poorest 25, 60 and 78 feet. The tunnel is comparatively dry, only a few water seams being encountered. No timbering of consequence was required. The tunnel is ventilated by an exhaust fan and a 12-inch air pipe. A candle can be seen for its whole length. The track is of 12-pound T rail, with 4x4 stringers. A 2-foot wide plank walkway is placed beside the track and over a ditch, which is 18 inches wide and 12 inches deep. The total cost of the tunnel for these four months, including labor, track, pipe, tools, blacksmith's coal, fuel for compressor, lights, explosives, timber, oil, etc., has averaged $12.41 per foot, which is not excessive in that district and present high prices. Two machine drills were used. Labor was in eight-hour shifts, except during the last six weeks, when drillmen worked six-hour shifts only. Mules were used after 500 feet to haul six to ten cars to the surface. The entire work was under the supervision of Thomas Davey, foreman of the De Lamar mine, and the De Lamar Nugget, from which the above is condensed, says to him is largely due the credit for the rapid progress.

During 1899, at the United States Assay Office in Boise, the deposits amounted to $1,813,988.61, an increase of $436,399.79, or 31.6% over 1898.

MICHIGAN.

The production of refined copper by the lake mines in 1898 was 157,835,729 pounds; an estimate of last year's production is 157,500,000 pounds.

MONTANA.

SILVER BOW COUNTY.

The bill of costs in the suit of the Montana Ore Purchasing Co. against the Boston & Montana Co. over the veins of the Pennsylvania mine has been submitted to the court by the plaintiff. The Inter-Mountain says it is the largest ever presented in a Montana suit, aggregating $324,134.68. Of the total $258,373.01 is placed to the credit of development work. The amount paid the attorneys does not come under the heading of legal expense, and therefore no reference is made to it in the document. The various items of expense are as follows:

Deeds	$46 70
Witness fees	1,641 00
Surveying	3,500 00
Development work	258,373 01
Preparation of maps	5,184 57
Models	3,494 41
Stenographic work	1,050 80
Assaying	1,516 00

The expert work necessitates an outlay of $21,891.64, divided as follows:

O. A. Palmer	$3,496 50
J. W. Neill	1,925 18
F. L. Sizer	1,740 00
A. H. Brown	276 50
W. S. Kelley	2,654 30
G. W. Towne, Jr	436 66
James Macfarlane	1,800 00
C. H. Robinson	7,650 00
J. H. Trerise	1,912 50
Total	$21,891 64

The document further shows that over five miles of development work was done in the property by the plaintiff, while preparing for the trial. It is divided as follows: Open cuts, 885 feet; tunnels driven, 775 feet; shafts sunk, 393½ feet; winzes sunk, 307 feet; raises driven, 6312½ feet; drifts and crosscuts driven, 20,133 feet; making a total of 28,806 feet at a cost of $8.95 per foot.

The laws of Montana now provide that persons filing water rights must state the amount of water they claim in cubic feet per second. The old law recognized the time-honored Western measurement in miner's inches, each being the amount of water which would flow through a hole 1 inch square under a head of 6 inches. With slight variations, this rule held good from the Missouri to the Golden Gate. One cubic foot per second equals 40 miner's inches.

NEVADA.

ELKO COUNTY.

At Elko last week the property of the Gold Creek M. Co. was sold to satisfy a judgment in the sum of $17,061.35. It was bid in for the amount of the claim.

WASHOE COUNTY.

Tests are being made at the Reno Reduction Works of the Jackson & Libby new method of working copper ores by electrolysis.

NEW MEXICO.

The Territory figures for '99 a yield of $1,800,000 gold. The value of copper was about the same as gold, one-third of it being treated in El Paso and Pueblo, and the rest at Silver City. Santa Rita and Hanover were the largest producers. The copper carries gold, but in this estimate the values are separated, the copper value alone being about $1,800,000. Iron ore valued at $75,000 to $100,000 has been shipped to Pueblo.

The only lead properties shipping largely are at Cook's, near Deming. The mines have in some years shipped $250,000 and probably reached $200,000 this year. Large bodies of zinc in Grant county have been worked slightly. Silver to the extent of $650,000 has been mined in straight and mixed ores.

The coal mines at Gallup have doubled

their output. The mines of the new White Oaks region ship a trainload of coal daily. The mines of the Colorado Fuel & Iron Co. at Cerillos and elsewhere are not increasing in production.

SIERRA COUNTY.

The Hillsboro mines during 1899 produced 6,156 tons of ore. Of this, 5,325 tons of milling ore showed an average value of $19.43 per ton, and 831 tons shipped to the smelters was worth $83 per ton. The placers yielded $8000, making a total production of gold of $181,500. For every $5 of gold there were also $1 in copper and silver.

OREGON.

BAKER COUNTY.

The Baisley-Elkhorn mine shaft is to be sunk deeper and an electrical installation is contemplated. The December output of the Bonanza mine was over $100,000.

Arrangements for deep mining at the Red Boy, in Sumpter district are perfected. The owners, who so far have been taking out ore by tunnel, will now sink a deep shaft.

JACKSON COUNTY.

H. E. Ankeney, of the Sterling mine, is operating his hydraulics night and day under a full head of water and expects to sweep a large area of bedrock. He has twenty-six men at work.

SOUTH DAKOTA.

State Mine Inspector Cusick estimates the State output of '99 as follows:

Homestake M. Co	$2,674,336
Highland M. Co	936,000
Horseshoe Co	562,100
Holy Terror	900,000
Hidden Fortune	200,000
Golden Reward (chlorination)	648,000
Blacktail mines	60,000
Golden Reward Smelter	2,300,000
Rapid City (chlorination)	24,000
Allen, Small & Asso (cyanide plant)	19,000
Spearfish cyanide plant	63,000
J. R. stamp mill	6,000
Central City cyanide plant	8,000
Cochran quartz mill	9,000
Placer mines	12,000
Other mines and mills	10,000
Ore shipped out of Black Hills	700,000
Total	$9,131,436

UTAH.

JUAB COUNTY.

During 1899 there was produced from the mines of the Centennial-Eureka Co. 58,250 pounds of lead, 666,547 pounds of copper, 238,981 ounces of silver and 13,-702$\frac{200}{1000}$ ounces of gold. This property paid its owners 142 dividends of 50 cents each, a total of $2,100,000, the amount which was received by them for the property from its present owners.

The Bullion-Beck & Champion operated its concentrating mill four months during 1899. It has a capacity of 200 tons of ore per day. During the year it shipped: Concentrates, 1954 tons; ore, 14,545 tons; total, 16,499 tons. It also paid $100,000 in dividends, bringing the total in dividends to the company up to $2,557,000. No surface improvements were made.

WYOMING.

During the year 1899 Wyoming's mineral output amounted to $6,091,763.85, divided as follows:

Coal	$4,659,156 25
Gold	1,003,191 00
Copper	275,960 50
Iron	114,500 00
Silver	39,456 10

FOREIGN.

AUSTRALIA.

A Melbourne dispatch says the gold yield of that colony in 1899 was 854,500 ounces, an increase of 17,242 ounces.

BRITISH COLUMBIA.

The Minister of Mines has issued a notice terminating the tenure of office of all gold commissioners and mining recorders for the districts the boundaries of which have been changed, and reappointing them to the newly described districts. Transcripts must be made of all records of claims affected by the boundaries, even in cases where claims have become vacant or have been abandoned.

LOWER CALIFORNIA.

The Boleo Copper Co., at Santa Rosalia, is credited with having bought 12,000 tons of coke to be shipped to Guaymas by rail and across the gulf to its destination.

MEXICO.

In the Santa Barbara mining district, near Parral, the Guggenheim Bros. and the Kansas City Smelting & Refining Co. have recently invested $4,000,000 in mining. The Guggenheims have bought the Tecolotes mine from the Etquicia M. Co. for the round sum of $700,000. The Kansas City company has bought more than 100 claims, among them the Alfareria mine, for $125,000 in gold, the Santa Gertrudis for $70,000, the Rosario for $60,000, the Remedious for $10,000, all these in Mexican currency, and the Mina Del Auga. The Kansas City company, through its representative, H. L. Bridgeman, has secured a concession for a section six miles square, for which it paid the Government $50,000. All these purchases have been made for cash paid on delivery of the title deed. The mines on the average produce low-grade ore. None are more than 150 feet deep. The Mexican Central has surveyed an extension of its line from Parral to several miles south of Santa Barbara.

SOUTH AFRICA.

The DeBeers Mining Co. announces that it has a message from the board of directors at Kimberley instructing the London office not to pay the semi-annual dividend now due, as the company must husband its resources, and it is uncertain whether it will be able to resume work in the mines.

THE KLONDIKE.

Engineer J. C. Tache, at the Five Fingers, will blow up those dangerous rocks as soon as the river is well frozen around them, and will also clear the Rink rapids. This will almost make navigation in the Upper Yukon or Lewes river safe. The Yukon begins at Fort Selkirk where the Pelly joins the Lewes. The creeks leading into the Stewart river are said to be showing up well. The Stewart runs into the Yukon, seventy-five miles this side of Dawson, where there is plenty of timber and an ample supply of water, just what a miner most desires with a thawing machine.

From the number of free miners' licenses issued at Dawson during '99 indicates there are 10,000 men mining in that district. From Nov. 1, 1898, to Nov. 1, 1899, were issued 10,018. During those twelve months there were issued 11,349 placer mining grants, 4,967 for original locations, 5,161 renewal of extent grants and 1,221 for relocations. There was filed a total of 1,705 relocation applications, about 30% of which were refused because of insufficient proof as to the validity of alleged claims of forfeiture.

The total number of quartz claims which had been granted in the Dawson district up to and including Nov. 7, 1899, is 525. These grants are for 1500x1500 feet each. To date annual assessment work had been performed only on seventy-nine of these claims, while applications for final crown grant has been made for only four. As to hydraulic concessions there have been filed about 245 applications, covering nearly 830 miles.

Commercial Paragraphs.

THE San Francisco agency of Schaw, Ingram, Batcher & Co. is now at 539 Mission St.

J. D. HEINZMAN has become a partner of A. M. Donaldson, Denver, Colo., buyer of bullion, wastes, ores and metals.

THE Hercules Gas Engine Works, of San Francisco, will in future be found at their new and handsome headquarters, 141 and 143 First St., where Manager Poindexter will have on display and in running operation different sizes of their manufacture.

JOHN A. ROEBLING'S SON'S COMPANY, 117-119 Liberty street, New York City, and Trenton, N. J., has the contract for the steel cables, bands, suspenders, coverings, sheaves and their appurtenances for the new East River bridge at New York City. This company was the only bidder. The contract price is $1,398,000. There will be 4000 tons of material required in the work.

WM. AINSWORTH & SONS, manufacturers of assay balances and scientific instruments, Denver, Colo., are constantly increasing their facilities for work, now having a force of twenty men. A new feature in their assembling department is an iron frame, 20 feet long, sustaining 40 feet of bench room for all kinds of fine lathe work; and upright arms holding line shaft and counter shaft, thus doing away with ceiling hangers. Messrs. Ainsworth have established an agency and put in a stock in the City of Mexico.

Calendars.

Literally a "flood" of calendars sweep in for 1900. Bright and brilliant is that sent by the Wm. Powell Co. of Cincinnati, Ohio, whose regrinding star-valve is becoming so well known. The handsomely bound catalogne supplied by the Joshua Hendy Machine Works, San Francisco, is also a thing of beauty and a joy for 365 days, and the Gates Iron Works, Chicago, Ill., furnishes a fine celluloid one that is good for the first half of the twentieth century.

Personal.

GEO. JACOBS succeeds C. H. Dunton as Supt. Larkin mine, Placerville, Cal.

ROBT. E. TALLY, assayer at the Reno. Nevada reduction works, has resigned his position.

D. H. JACKSON, of El Dorado county, Cal., has returned from San Francisco to Placerville.

C. M. DOBURY is in San Francisco to organize the Tuolumne, Cal., Power & Electric Co.

JUAN F. TREVINO has been appointed general manager Chihuahua (Mexico) Mineral Railway.

CHAS. DOBLER, Supt. Brown Bear mine, Deadwood, Trinity county, Cal., is in San Francisco.

T. W. PAYNE, Gen. Mgr. Grand Reef mine, has returned from New York to Wilcox, Arizona.

J. R. DILLON, president Jerome, Arizona, Copper Co., is examining mining property in Mexico.

W. H. THOMAS, former manager Niagara M. Co., Bingham, Utah, is at the smelter, Madera, Cal.

OSCAR SZONTAGH has taken charge of the metallurgical work at the Bully Hill mine, Shasta county, Cal.

FRANCIS JANNEY succeeds D. C. Jackling in the superintendency of the Golden Gate, Mercur, Utah, mill.

JOS. S. WOODRUFF is traversing Oregon and Washington, collecting mineral specimens for the Paris Exposition.

A. F. HOLDEN, president Centennial-Eureka M. Co., Utah, has gone to Costa Rica to inspect mining property there.

A. J. BAYS, of Juneau, has been appointed deputy U. S. Marshall at Cape Nome. He will go in this winter over the ice.

CHAS. R. WARDLE of New York is in San Francisco, en route home from examination of mining property in northern California.

WARNER MILLER, of New York, is reported to be at the head of a movement for a new railroad from Salt Lake City to San Francisco.

LOUIS GLASS, of San Francisco, has returned from a visit to the Cherokee mine, Butte county, Cal., of which he was formerly superintendent.

MAJOR W. H. HEUER, U. S. Engineer Corps, and member of California Debris Commission, at San Francisco, is promoted to be Lieutenant-Colonel.

LEO VON ROSENBERG has returned to New York City from California, after examining mining properties in California, Arizona and New Mexico.

JAS. BEVERIDGE, recent Supt. New Mammoth, Utah, M. Co., goes to Ecuador, S. A., to manage the mining property of the American Development Co.

W. A. HEWITT, of the Compressed Air Machinery Co., 11-13 First St., San Francisco, has returned from an extended business sojourn on the Atlantic coast.

JAS. R. KEENE, who once ran a milk wagon in Yreka, Cal., is credited with "cleaning up" $3,000,000 in stock deals in New York City in the past sixty days.

A. L. WATERS, formerly with the United Globe, Arizona, smelter, is now Supt. Val Verde smelter, on the Agua Fria, twenty miles from Prescott, Arizona.

WILLIAM H. NUTTING, of Colorado, will superintend the construction of the pyritic smelter, with which the ores of the Bingham C. & G. M. Co., at Bingham, Utah, are to be reduced.

W. E. COOKE, representing the Kalgoorlie Electric Power & Lighting Corporation of London, and Kalgoorlie, Australia, is inspecting the mines and power plants of Cripple Creek, Colo., district.

W. M. THORNTON is in San Francisco, en route to Anaconda, Montana, from the Philippines, whose mineral resources he thinks will be worth developing by American miners after peace has been restored.

FRED NOWELL, of the American G. M. Co., at Skaguay, Alaska, from a trip to Berner's Bay, says that on the Kensington mine of the Northern Bell G. M. Co., development work progresses. Work at the Comet is showing good quality of ore, and thirty stamps will be operated through the winter.

W. C. GREENE, Pres. Greene Con. M. Co., Arizona, is in San Francisco on his way to New York. He says 300 men are at work in the Cananeas at the mines and at the smelter of his company. Six carloads of copper matte are monthly shipped via Naco, a 45-mile haul. Geo. Mitchell, formerly of the United Verde, is in charge. Naco, Ariz., is his address.

WILLIAM H. BAKER, vice-president and general manager of the Postal Telegraph Co., says: "The telephone and telegraph companies, with the electric light and trolley car concerns, consume a large part of the copper produced. But we cannot pay the present exorbitant price. Our company has reached the conclusion that aluminum wire is preferable. The wire must be twice as large to obtain the same conductivity, but in spite of its increased size it is much lighter than copper, and already cheaper. If the present price of copper holds aluminum will be generally adopted by all concerns which require wire to transmit electricity."

GOVERNOR THOMAS has appointed the following delegates to represent Colorado at the National Mining Congress to be held in Milwaukee next June: H. A. Lee, W. S. Stratton, Alva Adams, W. F. Buckley, James Doyle, John R. McKinney, Frank M. Woods, J. F. Burns, W. S. Montgomery, Clark W. Roe, Victor G. Hills, C. J. Moore, A. V. Bohm, C. T. Carnahan, Henry I. Higgins, S. J. Sullivan, Francis Carney, T. S. Walsh, F. H. Cane, George S. Newman, S. I. Hallack, Frank E. Wheeler. D. A. Tarrell, E. J. Elliot, James H. Robin, E. G. Stoiber, W. Z. Kinney, S. V. Newell, W. H. Graves, Charles Painter, Mead Hammond, J. A. Minor.

Industrial Notes.

—Iron and steel of the value of $7,600,000 were produced in Colorado last year.

—The Santa Fe and the Southern Pacific Companies have perfected an agreement dividing California business.

—The Wilmerding School of Industrial Arts began its existence in San Francisco on the 8th inst., with eighty pupils.

—The Southern Pacific Co. will lay double tracks on every line radiating from San Francisco for a distance of 100 miles.

—The Telluride Electric Power Co., Colorado, has ordered increased amounts of aluminum wire for conveying current.

—The O. R. &. N. Company and the Oregon Short Line have contracted for a $300,000 new equipment, to give double service between Portland and Granger.

—A. Bodyuuski, V. Patapoff and F. Brevisoff, of Russia, are in San Francisco as commissioners from Russian colonists to report upon the Pacific point best suited for a colony.

—"To raise and maintain prices" the shingle mills of Whatcom county, Wash., were closed last November. The secretary writes that that object has been attained, and the mills will resume.

—The torpedo boat destroyer Goldsborough, which the Wolff & Zwicker Iron Works of Portland have completed, was given her trial on the Columbia this week and attained a rated speed of 32½ miles per hour.

—The French embassy in Washington informs the State Department that the Government at Paris has consented to suspend the customs duties on advertising matter from the United States intended for circulation at the Exposition.

—Regarding that California eight-hour law, the State's Attorney-General has decided that "a watchman or special policeman who performs no labor is not a laborer within the meaning of the statute, nor is he either a workman or a mechanic."

—The contract for construction of twenty-three miles of the Colorado Springs & Cripple Creek Railroad is let. The brokers of the Colorado Springs Mining Stock Exchange have subscribed the bonds. The entire sale of bonds amounts to $1,200,000.

—The United States will have a more extensive exhibit at the Paris Exposition than any other country with the exception of France, which will utilize one-half the total space. The American exhibit will be several times larger than Great Britain's, and as large as Russia's and Germany's combined.

—Two large corporations have been formed in New Haven, Conn. One, the Ontario, Lake Superior Company, with a capital of $20,000,000, will operate timber lands and engage in transportation business in conjunction with the Canadian Pacific. The other, the War Eagle Consolidated Mining Co., with a capital of $15,000,000, will develop mines near Boise City, Idaho.

—The Dawson telegraph line paid an aggregate of $13,000 for October and November in tolls. One day in December $400 was taken in at Skaguay. Messages of a commercial nature come and go between the United States and British Columbian points, Germany, France, England, Belgium and New Zealand. Messages received at Skaguay are dispatched by the first steamer leaving under American or other flag for the south, and are telegraphed to destination from the first point touched by the ship having connection with wire with the outside world.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING JAN. 2, 1900.

640,264.—SKATE—S. S. Black, Pasadena, Cal.

640,445.—METAL PARTITIONS FOR BUILDINGS—C. Collins, S. F.

640,178.—SPRING HINGE—J. W. Currier, Los Angeles, Cal.

640,277.—TROUSERS' PROTECTOR—P. E. Daniels, Oakland, Cal.

640,637.—HASP FASTENER—J. Davey, Oakland, Cal.

640,642.—HAT FASTENER—A. B. Enns, Dallas, Or.

640,372.—HEADER AND THRASHER—J. G. Evans, Waitsburg, Wash.

640,463.—HYDRAULIC ELEVATOR—P. J. Gildea, S. F.

640,378.—OIL BURNER—C. A. Hammel, Los Angeles, Cal.

640,285.—RAILWAY TIE—W. M. & E. G. Hodson, Roseburg, Or.

640,569.—NUT LOCK—J. Jorgensen, S. F.

640,304.—CLAMP—E. L. Lowe, S. F.

640,578.—TEMPORARY BINDER—E. Marsky, San Jose, Cal.

640,477.—STREET SWEEPER—J. Maxon, Burbank, Cal.

640,411—PLOW—W. H. Parlin, Seattle, Wash.

640,695—CARBURETOR—E. D. Parrott, Portland, Or.

640,487.—BICYCLE SUPPORT—V. A. Pernot, Colegrove, Cal.

640,488.—MUST PUMP—J. A. Philpott, Windsor, Cal.

640,496.—CARTRIDGE LOADER—G. E. Standish, Selby, Cal.

640,714—LOOM—Simpson & Northrop, Tustin, Cal.

640,117.—EXTRACTING PRECIOUS METALS—Tatro & Sharpe, Seattle, Wash.

640,718.—EXTRACTING PRECIOUS METALS—Tatro & Sharpe, Seattle, Wash.

640,242.—STEAM STEERING GEAR—Turner & Miller, Seattle, Wash.

640,341.—ROCK DRILL—G. D. Whitcomb, Glendora, Cal.

640,248.—PAPER FOLDER—F. Wulff, Colusa, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

METAL PARTITION AND FURRING FOR BUILDINGS.—C. Collins, San Francisco, Cal. No. 640,445. Dated January 2, 1900. The object of this invention is to construct a light and rigid metallic frame work which will serve for partitions, furring, ceilings and other subdivided structures. It consists of strips or sheets of metal which are slotted or cut so as to provide strips which remain connected at one end with the main portion, and are bent outwardly therefrom and extend across at any desired angle, and either flat or twisted so as to form connections and braces between adjacent main strips.

NUT LOCK.—J. Jorgenson, San Francisco, Cal. No. 640,569. Dated Jan. 2, 1900. The object of this invention is to provide a locking device for nuts which are used upon vehicle axles, shafts or bolts, and under such conditions that the nuts fit upon the end of the shaft or bolt where it is necessary to prevent their turning off or becoming loosened, while at the same time they may be easily disengaged when it is desired to loose the nut. The nut has a radial groove straight across its face from the central opening to one outer edge, a hole made at one side parallel with the central threaded opening. A spring-pressed stem is mounted in said opening, and an arm directly on the end of the stem extends at right angles thereto straight across the face of the nut, radial to the center of the opening and lying within the radial groove. This arm has a beveled point lying interior to the wall of the opening in the nut adapted to engage a notch in tha screw to lock the parts after the nut has been seated. The spring by which the arm is normally held in engagement with the nut will readily yield to allow the arm to be raised and thus disengage the locking device when it is desired to remove the nut.

MUST PUMP.—J. S. Philpott, Windsor, Cal., one-half interest assigned to Geo. A. Nalley, same place. No. 640,488. Dated Jan. 2, 1900. This invention relates to that class of pumps which are designed to remove the express juice of the grape called "must." It comprises open-topped cylinders with pistons movable therein, a crankshaft with connections between the pistons and the cranks, so that by turning the shaft the pistons are reciprocated. Ports are made through the pistons surrounding the center, and a spring-pressed valve is closable from below over the ports. A valve chamber is bolted to the bottom of the cylinder, having a passage between it and the lower part of the cylinder. A spring-pressed closable globular valve is fitted into the chamber and closes the passage on the upward movement of the piston, but opens when the piston is forced down to allow the escape of the liquid. The valve has a guide stem from below and a conical vertically perforated projection from the lower head of the valve chamber forms a guide within which the stem is slidable and the valve and spring maintained in position. Holes are made through the bottom of this guide hole for the escape of any liquid which may find its way therein.

HYDRAULIC ELEVATOR.—P. Gildea, San Francisco, Cal. No. 640,463. Dated Jan. 2, 1900. This invention relates to an apparatus which is designed for elevating sand and other material by the aid of jets of water introduced under pressure into the elevating pipe. It consists of concentric tubes, the inner of which conducts the material to be lifted and the outer of which receives water under pressure, which is delivered into an enlarged closed chamber at the lower end and surrounding the inlet of the inner chamber or tube. This inlet forms a suction pipe, and jet tubes or pipes passing through the bottom of the chamber discharge the water under pressure into the inner chamber, thus producing a vacuum which will draw the material through the suction pipe, and a velocity and momentum which will eject it through the discharge passage. These jet tubes are preferably spirally disposed around the inlet, and, by this construction, they produce a rotary or whirling action, which prevents the packing of the material and its lodgment within the apparatus.

COVER AND BINDER FOR PAPERS.—Emil Marsky, San Jose, Cal. No. 640,578. Dated Jan. 2, 1900. This invention relates to a cover and binder for magazines, pamphlets, loose sheets of any description and the like, which it is desired to hold temporarily and permanently between the covers. It consists of a rigid back having rigid flexibly connected edge sections and cover sections upon each edge. Rigid plates are fixed at each end of the back, with inwardly turned tongues adapted to engage slots in the papers to be held, and a spring or springs are fixed to one of the edge sections adapted to press upon the papers when said section is turned to enclose them. Clamps at opposite ends of the back have arms, one of which is pivoted to one of the edge sections and has an extension beyond its pivot point, and the other arm encloses the other edge section and is sufficiently shorter so that, when turned to allow the other parts to be opened, it releases the other large section, while the other arm extends across the other edge section and cover portion, which is flexibly connected therewith.

Recently Declared Mining Dividends.

Amazon, Colo., Co., 9 cents per share, $12,000; payable Jan. 15.

Consolidated Zinc & Lead Co., quarterly dividend, 2½% on preferred stock; payable Jan. 15.

Portland, Colo., Gold Mining Co., regular monthly dividend 2 cents per share, $60,000; payable Jan. 15.

Arizona-Eastern Montana Smelting Co., monthly 2%.

Cloverdale Zinc M. Co., quarterly 2%.

Vindicator Con. G. M. Co., Colorado, $53,250; payable Jan. 25.

Latest Market Reports.

SAN FRANCISCO, Jan. 11, 1900.

SILVER—Per oz., Troy: London, 27⅞d (standard ounce, 925 fine); New York, bar silver, 58⅞ cts. (1000 fine); San Francisco, 58⅞: Mexican dollars, 48c.

A Mexican dollar is worth 48 cents in American money; an American dollar is worth about $2.10 in Mexican money. The difference in exchange is made at the Laredo office.

COPPER.—New York, Lake, $16.50; electrolytic, $16.00; casting, $16.12½; St. Louis, $16@16.25; San Francisco, 17½@18. Mill Copper plates, 23¾c; bars, 25½@27c.

LEAD.—New York, $4.70; St. Louis, $4.75; San Francisco, $4.80; pipe 7½, sheet 8¾, bar 6½c. London, Soft Spanish Lead, £16 13s 6d=4.69c per lb. An interesting article on the change in the basis of lead quotations will be found on page 38.

SPELTER.—New York, $4.55; St. Louis, $4.50; San Francisco, ton lots, 5½c; 100-lb lots, 6½c.

ANTIMONY.—New York, 9½c; San Francisco, 1000-lb lots, 10c; 300 to 500 lbs., 11@14c; 100-lb lots, 15@18c.

BABBITT METAL.—San Francisco, No. 3, 6½@8c.

IRON.—Pittsburg, American soft, $25.25; Scotch, $26.50; San Francisco, bar, per lb., 3½c.

STEEL.—San Francisco, bar, 11½@20c per lb.

QUICKSILVER.—New York, $52.00; London, £9 13s; San Francisco, local, $51.50 ℔ flask of 76½ lbs.; export, $47.

PLATINUM.—San Francisco, crude, $14 ℔ oz.; manufactured, $19@22.

FERRO-MANGANESE.—San Francisco, ℔ ton, $30.

ZINC.—San Francisco, 53¼; slab, 6½c; bar, 8.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb.

TIN.—New York, pig, $26; San Francisco, $29; bar tin, ℔ lb, 35c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c.

NICKEL.—New York, 40@45c ℔ lb.

BISMUTH.—New York, ℔ lb., $1.60; San Francisco, $2.

CANDLES.—Granite 6s, 16 oz. 9½c; 14 oz., 8½c; 12 oz., 7½c; 10 oz., 6½c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

COAL.—San Francisco coast, yard prices: Wellington, $8; Seattle, $7; Coos Bay, $5; Southfield, $7.50. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.50; Scotch, $8; Cumberland, $9; Cannel, $9.50; Welsh Anthracite, $12.50; Rock Springs' $10.05; Colorado Anthracite, $14.50.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 34@36c ℔ lb.; carloads, 29@30c; in 10-lb. tins, 40c; sulphuric acid, 1¾c ℔ lb. 66% B; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@2¾c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, strictly pure, boiled, bbl., 66c; cs., 71c; raw, bbl., 64c; cs., 69c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 61c; cs., 66c; raw, bbl., 59c; cs., 64c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 20c; Astral, 20c; Star, 20c; Eocene, 22c; Extra Star, 24c; Elaine, 25c; Water White, bulk, in tanks, 14c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 55c; cs., 60c; No. 1 bbl., 45c; cs., 50c; Neatsfoot Oil, bbl., 55c; cs., 65c; No. 1 bbl., 50c; cs., 52½c; Crude Petroleum Oil, 8c; cs., 13c.; Whale Oil, bleached, 45c; Cocoa, cs., 55c.

Quicksilver

For Sale in Lots to Suit.

REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage, Money loaned mines, Mining companies organized, their property reported, financed and managed, Mines, prospects, mineral lands, mining securities, contracts, bonds, stocks, leases and options bought and sold or negotiated, Examine mines, prospects and mineral lands as to their value, method of working and condition of their titles. Assay and Chemical work done. EDW. N. BREITUNG, Marquette, Mich., U.S.A. CABLE ADDRESS, EDBEE. CODES: LIEBER'S, BEDFORD MCNEIL'S, A B C UNIVERSAL COMMERCIAL.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from J. F. Cowdery, in the Lucky Point Mine, near St. Louis, Sierra Co., to deposit tailings in a worked-out pit; from Chas. S. Diesem, in the Riffle Point Claim, at Grass Flat, Sierra Co., to deposit tailings in Grass Flat Ravine; from Morris J. Williams, in the Weeds Point Mine, near Camptonville, Yuba Co., to deposit tailings in a ravine; and from E. A. Moody, in the Inskip Placer Mine, at Gold Run, Placer Co., to deposit tailings in Squires Ravine, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on January 29, 1900, at 1:30 P. M.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING CO.,

San Leandro, Cal., U. S. A.

THE RISDON HAMMERED SHOES AND DIES

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cap and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

Up-to-date Miners who value their lives use

NO. 1 LAMP.

McINTYRE'S DRY BATTERY

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

The perfect vanner motion given to the pulp by our head motion, together with the freedom from "jumping" resulting from the special rigid guides used, explains why the Cammett riffles never "pack," and why the table has such a great capacity when handling slimes. : : : : : : : : : : : : : : : : :

The continuous grooves and riffles extending from end to end of the table maintains the greatest possible margin of safety between the concentrates discharge and the tailings. : : : : :

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

No. 1 Special Button Balance with 5-inch beam. Sensibility 1-200 Milligramme. Made for particularly accurate and rapid work and is guaranteed to be the finest balance on the market. It is the balance used by Prof. Forsythe of the Lawrence Scientific School, Harvard University, for scientific research. Send for Catalogue A, illustrating and describing a full line of assay and analytical balances, to

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.
Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.

The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.
By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

ASSESSMENT NOTICES.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of December, 1899, an assessment (No. 22) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of January, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 27th day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 22) has been postponed to THURSDAY, the 25th day of January, 1900, and the day of sale from the 27th day of January, 1900, to SATURDAY, the 10th day of February, 1900.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office, Room 31, No. 214 Pine street, San Francisco, California.

SOUTH PALOMA GOLD MINING COMPANY, Limited.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Directors, held on the 6th day of December, 1899, an assessment (No. 1) of six-tenths (6-10) of a cent per share was levied upon the capital stock of the corporation, payable immediately to the secretary, John F. Barnett, at Room 22, No. 222 Sansome St, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of February, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on the 19th day of February, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

JOHN F. BARNETT, Secretary.

Room 22, No. 222 Sansome St., San Francisco, Cal.

QUINCY MINING AND WATER COMPANY.—Location of principal place of business, San Francisco, California; location of works, Spanish Ranch, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of January, 1900, an assessment (No. 2) of forty cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 439 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of February, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

THOMAS QUIGLEY, Secretary.

Office—No. 439 California street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of January, 1900, an assessment (No. 10) of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of February, 1900, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

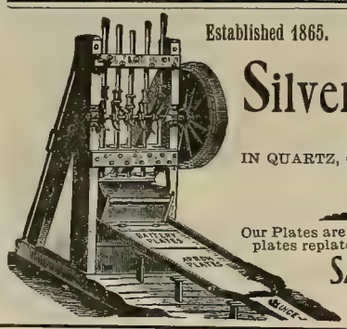
No. 3—ROASTING, SMELTING AND REFINING METHODS AND MACHINERY.

No. 8—CRUSHERS AND PULVERIZERS.

IN PRESS:

No. 4, 9th Edition—GOLD AND SILVER MILLS.



This has much new matter and will interest all mill men.

RIVETED STEEL WATER PIPE

RISDON IRON WORKS BEALE & HOWARD STS.
MANUFACTURERS SAN FRANCISCO, CAL.

All sizes of Steel Water Pipe for City and Town Supply, Placer, Hydraulic and Quartz Mining. Cut, punched and rolled to be riveted at destination or made up complete.

We make a specialty of all kinds of Heavy Sheet Iron and Steel Work. Plans and Estimates furnished.

Established 1865. NOTICE TO GOLD MINERS. Incorporated 1890.

Silver-Plated Copper Amalgamated Plates

FOR SAVING GOLD

IN QUARTZ, GRAVEL OR BEACH MINING. MADE OF BEST SOFT LAKE SUPERIOR COPPER.

AT REDUCED PRICES.

Our Plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining plates replated, bought, or gold separated. THOUSANDS OF ORDERS FILLED.

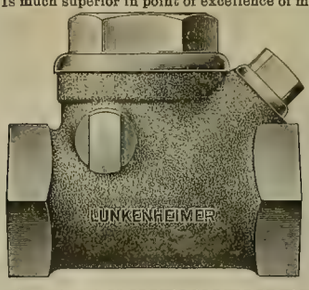
HERCULES HOISTS Are Sold the World Over.

Owing to greatly increasing business we have been compelled to seek larger quarters. We are now at 141 and 143 First street, where a full line of Stationary, Marine and Hoisting Engines is carried in stock, and sizes of each in running order so that intending purchasers can see them in operation.

HERCULES GAS ENGINE WORKS,
(INCORPORATED)
141-143 FIRST STREET, SAN FRANCISCO, CAL.

A GASOLINE OR OIL "HOIST"



that does its work without any fuss or bother is the "Weber." Correctly designed and built, in sizes from 6 to 150 H. P., with Single or Double Drum, for Gasoline, Gas or Distillate. Unexcelled for mining, quarry, or ship use. State sizes wanted and for what use.
Weber Gas & Gasoline Engine Co.,
430 S. W. Boulevard, Kansas City, Mo.
See our PUMPING PLANTS.

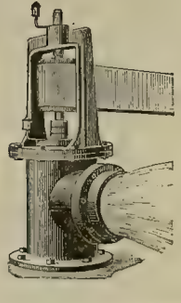
LUNKENHEIMER'S Regrinding Swing Check Valve

Is much superior in point of excellence of material, design and workmanship to any other valve of its class upon the market. The body is heavy and well proportioned, the seat is carefully finished and the workmanship is first-class. This valve is so designed that when the disc is raised the passage through the body is fully equal to the diameter of the connecting pipes.

By means of the regrinding feature the usefulness of the valve can be prolonged indefinitely. When worn in the seat the valve can be reground without removing valve from connecting pipes.

Made in brass, medium and extra heavy patterns, screw and flange ends ¼ to 3 inches. Iron body, brass mounted, screw and flange ends 2 to 6 inches. All valves are carefully tested and warranted.

Specify "Lunkenheimer" make. Sold by dealers everywhere.



Write for Catalogue of Steam Specialties.

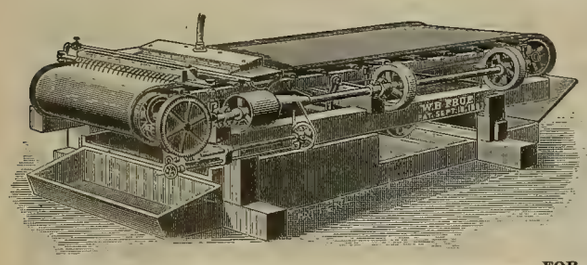
For Sinking

Wood's Propeller Pump

Stands pre-eminent. No gearings, valves, cylinders, plungers, exposed bearings or packings. There is economy, convenience and rapidity in sinking with this unique and reliable pump. Send for Catalogue.



L. G. HARRISON,

31 MAIN STREET - - - - SAN FRANCISCO, CAL.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.
" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

AND PACIFIC ELECTRICAL REVIEW.

No. 2063. — VOLUME LXXX. Number 3. SAN FRANCISCO, SATURDAY, JANUARY 20, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Portraying California Mining.

In the handsome and valuable volume "California Mines and Minerals," prepared for the visiting American Institute of Mining Engineers, appear many views of varied mining operations in the State of California, and through the courtesy of the compiler, Mr. E. H. Benjamin, secretary of the California State Miners' Association, a few are herewith reproduced. In the great gold area of the second largest State in the Union, covering an area of 160,000 square miles, are many different forms of gold mining, and on the principle that the best process is the one that pays the best, anything and everything from an arrastra to a fully equipped 200-stamp mill, and from a primitive pipe to the modern electric transmission is used. The first picture portrays an ancient arrastra in Trinity county, in the northern part of the State, which has ground out many a good gold dollar for its owner. Hydraulic mining, as carried on in Tuolumne county, is portrayed in the picture on the right of that of the arrastra, and just below this line is shown how a gravel channel is prospected for by boring in Siskiyou county. Next to it are depicted the hoisting works of one of Amador county's great gold producers; below it appears a portrayal of the mouth of a shaft in another deep quartz mine of Amador county, with a big dividend record and a recent new lease of auriferous life. Amador county holds deserved prominence in proving that California mines "go down," and that surface scratching which has produced over a billion dollars gold but indicates the great extent of California's gold-bearing area, and that "sand" and science combined make deep quartz mining in California a profitably paying proposition. The large number of technical articles published in this paper from many of Amador county's progressive mining men have shown in detail how deep mining in California progresses. Beside the brief mention herein, the Kennedy, the Oneida, the Argonaut and the Wildman-Mahoney may be cited as examples. The picture in the lower left-hand corner shows a part of the apparatus used in a representative California hydraulic mine, where a hydraulic elevator is being placed at the Mammoth bar, in one of the richest gold sections of Placer county, Cal.

THE intent of the Federal mining law is to reward the discoverer, and as a mineral discovery is almost almost always made upon the apex it does this by giving to the owner of the apex the ownership of the vein to any depth. Mining litigation as to extra-lateral rights often arises from the contention that the owner of overlying surface—who is not the discoverer and owns no portion of the apex of a vein—is better entitled to the ores than he who discovered the vein and does own its apex.

FOR some years prior to '93 Colorado was the leading producer of silver of any State in the Union. Upon the slump in silver Colorado virtually said, "Is it gold that is wanted? Very well, gold it shall be," and straightway began turning out gold till since '97 it has been the leading gold-producing State of the Union. Its mines of lowest altitude begin at about the same elevation as most of those of California's highest altitude. Colorado is well supplied with railroads, and those railroads work for the mineral development of the country from which they derive their support.

THE 12th census of the United States will be taken next June. Section 8 of the census bill specifically provides for the collection and publication of statistics regarding mines, mining and minerals. That part of Section 8 relative to mining reads as follows: "To mines, mining and minerals and the production and value thereof, including gold, in divisions of placer and vein, and silver mines, and the number of men employed, the average daily wage, average working time and aggregate earnings in the various branches, and aforesaid divisions of the mining industry: Provided, That the reports herein authorized relating to mines, mining and minerals shall be published on or before July 1, A. D. 1903."

A MINER left Eureka, Nevada, last week to attend to some claims of his in Nye county, Nevada, the county next adjoining, about 100 miles distant. He traveled to Palisade, Nev., thence to Sacramento, Cal., to San Francisco, to Mohave, to Manse, Arizona, thence by stage to his destination, nearly 2000 miles to get 100 miles away. Such roundabout travel is not as much of a necessity as it was a few years ago. As requirements open it becomes easier to travel, and if it is worth while railroads will be built anywhere. The Klondike is nearer San Francisco to-day than certain parts of California, but did mineral development demand there is no part of the west half of America that would not be readily reached by rail. To an Eastern reader it may seem singular that a man should have to traverse two States and a Territory to get to the next county, but in this case he doubtless took the quickest and easiest route.

Patentable Ideas.

This week are received two letters—one from northern California, the other from Idaho—asking if certain alleged improvements in mining devices are patentable. Each expresses the belief that a new and valuable idea is involved, that he has a valuable improvement, but that the long-continued and general use of the mining apparatus mentioned may preclude the possibility of patent. That is a mistake. No matter how old or widely used a machine of any kind, if susceptible of improvement, such improvement is just as much a legitimate subject for patent as though the machine to be improved had never been heard of. "What is an invention?" has been asked countless times, and courts are constantly called upon to decide what is or is not an "invention." Without attempting to be legal or exact it is believed that an "invention" is an original adaptation of some one of the five mechanical powers, or the exercise of original thought in connection with a patentable article, or the first sufficient answer to a new question, or the finding of a new and better answer to an old question. At first glance one would think that an ore concentrator, a fountain pen, a rock drill or a plow did not, by reason of the degree of perfection each has attained, offer any field for the inventive faculty; yet, weekly, patents are granted thereon for what are held by the Government patent office to be new ideas applicable to these mechanical devices. This week's official record gives an illustrated account of a patent on a monkey wrench. Our California and Idaho correspondents, if they really have devised an improvement on the mining machinery to which they refer, can go ahead and get their ideas patented. The first thing for each to do—provided he concludes to prosecute the idea to a conclusion—is to carefully and accurately prepare a clear, detailed statement of what he claims, and submit that to a competent patent lawyer who, after research, will give his opinion thereon; if favorable, he will send it to the patent office at Washington, D. C., where the examiner will decide whether or not the idea is patentable. His decision is final. If he concludes that there is sufficient originality in the idea submitted it will be for the devisor to say if he wants to go to the additional expense of securing a patent.

What constitutes an invention is a matter of constant discussion; sometimes a very little thing is an "invention," and a valuable one. Recently the direction in which a little hole was bored in cast iron became a matter of invention, and was patented. This is doubly noticeable because the boring of the hole had gone on unintentionally before its value was recognized. In fireplaces, gas is often introduced into cast-iron imitations of logs with imitation moss made of asbestos, the whole thing looking ornamental when lit. It is necessary that the gas flame should lie close to the cast-iron "logs," and that there should not be a little explosion when the gas is turned off. This is secured by drilling the little holes through which the gas comes out at a sharp angle to the surface of the log. These logs are half round, and it was the custom to lay them on a driller table to have several rows of holes drilled in them, and the boy who did the drilling found it convenient, by reason of the way the log lay, to drill part of the holes inclined and part at nearly right angles to the surface of the log. It was found that, if all the holes were drilled at the same acute angle, the outer opening higher than the inner opening, that there was no explosion at starting or stopping the gas fire, that the flame lay close to the log, there was more heat for the same amount of gas burned, and the thing looked better. Just the direction of boring a little hole in a cast-iron "gas log" didn't seem much, but the idea was patented, and, like other ideas, had considerable commercial value.

Our advice to our correspondents is to go ahead on the lines indicated; and if it appear that they can improve upon existing forms of mining machinery, it will be a benefit all around—benefit to the users of such machinery forever, and, incidentally, to themselves if they succeed in profitable use or transfer of their inventions.

Good Roads Necessary.

With good roads as a text, Hon. Jno. F. Davis of Amador county, Cal., gives a local paper several good pointers on their necessity to the mining industry of the several counties. He points out the patent fact that to the county mining organizations should rightly be delegated such work, that each county must immediately or ultimately depend upon itself to have such work done, and that as an adjunct and salvation to the mining industry it should not be a silent precept, but an active duty. With the greatest gold district on earth California lags; rightly developed, the steady thunder of stamps should be heard throughout the entire 700 miles of the State's length along its axial line. California's yearly gold yield should be thirty millions instead of fifteen. No matter how great the resources, how rich the mines, how promising the outlook for profitable output, the plain fact is that California, the home of scientific mining and advanced miners, is no longer at the head of the procession. Why this is has been repeatedly shown in these columns and universally agreed to. A wide-awake miners' organization in each county, a crystallizing of public spirit and a general pressure of public opinion are necessary. A good beginning would be in the matter of roads. Take up any California paper published in a mining district of the State and the first item is, in speaking of a mine, "machinery awaits the workers at the depot, but just now an empty wagon couldn't be hauled to the mine." Millions of dollars are annually lost to the State by such apathy. Hydraulic miners complain of the tribute levied on them by small, miserable creatures belonging to antagonistic associations, but such tax is light in comparison with the tax annually levied by the quartz miners upon themselves by their system or lack of system of county roads. The remedy is organization. Everywhere throughout the mining counties miners are in the majority. Organize, elect supervisors pledged to build roads and see that they keep their pledges! Mr. Davis says "the question is how to get the necessary money." The way to get it is to levy a tax and—most important of all—see that the money collected is spent with some regard to intelligence and economy.

IN an arbitrary and unbusinesslike way Colorado smelters are advancing the price for treating Cripple Creek ores. Such action is arbitrary because it goes on the assumption that they have a "cinch," and can charge what they please. It is unbusinesslike, because business is the systematic supplying of wants, and it isn't business to act so that customers or patrons grow dissatisfied for cause. Cripple Creek mine owners have protested, but the protests have been unheeded. Accordingly they will act. While storing their ores awaiting a cheaper treating process they are discussing the joint creation of cyanide and chlorination plants and a smelter. In Requa gulch the Woods Investment Co. have put in a 350-ton-daily chlorination plant, which works successfully. Other large concerns feel that their patience has been abused and that the best remedy for imposition is to help themselves. J. B. Grant, the Western manager of the smelter combine, says that "there was no money in treating Cripple Creek ores on the old basis," and that it is only in Cripple Creek that there is any advance. The reason for the last statement is manifest. The assertion that the former treatment of Cripple Creek ores was unprofitable is best answered by reference to the statements made by Mr. Grant and his confreres when the combine was in process of formation.

DIRECTOR OF THE U. S. MINT ROBERTS has laid out a big task for himself—no less than to find out where all the gold goes to; how much is used in the arts and industries, etc. He says he will send letters to sixty thousand people—photographers, dentists, gold and silver workers, jewelers, painters, gold-leaf workers, embossers, etc.—to find what amount of gold each uses in a year. It is estimated that in the United States such annual consumption of gold amounts to $12,000,000; that in this country alone $5,000,000 annually goes to the filling of teeth, $2,000,000 yearly plastered over buildings as gold leaf on signs, etc. M. H. Gournay calculates that the world absorbs $125,000,000 gold per annum.

Concentrates.

THE contents of this paper are copyrighted.

IN 1898 California produced 541 long tons manganese, average value $5.96 per ton.

AUSTRALIA continues to ship zinc sulphides to Europe, but expects to treat them locally.

A DRY concentration method of separating manganese ores is furnished by the Wetherill Separating Co., New York City.

A TECHNICAL ARTICLE on the leaching process for copper ore, specially written for this paper, appeared in the issue of April 16, '98.

ABOUT twenty-five American soldiers have returned to San Francisco from the Philippines, insane, which ought to be pointer enough for American miners.

THE "flat rate" no longer exists at Arizona smelters; the increase in railroad facilities and corresponding reduction in freight rates is also a help to the development of that rich country.

FASHION has a good deal to do with mining investments. For some years California mines have not been unfashionable in London. Of late they have become fashionable in Boston.

UNDER a head of 100 feet, through a 3-inch nozzle, a pipe would (theoretically) discharge about 4 cubic feet per second; in actual practise about 3, or, approximately, about 109 miners' inches.

THERE is gold in Nicaragua, and on both the Pacific and Atlantic side free-milling ore is treated in several mills, but no American miner should think of going there looking for employment.

DRY and oil lubricants each have their admirers; the best is that which needs the least renewal and most obviates friction. For light and fast running machinery fine oil deservedly continues in favor.

THE constant fall in the price of chemicals may cause the business inconvenience to producers always consequent upon competition, but the benefit the public derives always outweighs any individual loss.

PRESTON'S California Gold Milling is the best book on that topic. It is out of print, but a copy may be picked up second-hand. It was published in its entirety in this paper, and back numbers containing it can be procured.

APPRECIATIVE contemporaries that appropriate whole pages from this paper without credit are kindly reminded that the contents of this paper are copyrighted, and permission must be secured for republication of any of the contents of any issue.

THE violent pounding mentioned by B. D., Los Angeles, Cal., may be occasioned by the force pumps for feeding the boiler being set on an elevation above the level of the feed water in the heater if the temperature of that water approximate 212° F.

WHEN radiant force is exercised through space from a point, its intensity varies inversely with the square of the distance. Thus the intensity of light radiated by a luminous point at twice the distance therefrom is of one-fourth the intensity it had at the distance in question.

IT is not understood that gold is precipitated in the cyanide solution, but is deposited, and for this deposition the zinc threads are required. It is patent, also, that oxygen must be present before gold will unite with potassium cyanide. The entire process is chemical—not mechanical.

IN constructing or buying mining machinery for specific purposes it is as important to take into consideration specific gravity as hardness. The specific gravity is the volume, hence the capacity of an ore crusher is largely determined by the specific gravity of the material to be put through.

NOW is the proper time for claim owners with delinquent partners to advertise those out who have failed to contribute their proportion toward the annual labor required by law. It takes nearly six months to oust a delinquent co-owner — ninety days for publication and ninety days thereafter.

A SLUICE 12 inches broad, 6 inches deep, to give a velocity of 320 feet per minute, should have a grade of 56.18 feet per mile, or 1¼ inches per box of 12 feet. For ordinary gravel about ten tons water per cubic yard is none too much. Cement gravel, after blasting, would require about 50% additional.

NEVADA COUNTY, CAL., at present furnishes ice in crystal slabs from one end of the county, oranges in fullest ripeness from another part, and gold in plenty from her quartz and placer mines. Great is California! Nevada is one of the smallest of its fifty-seven counties, but this illustrates its resources.

IT is not practicable to get details of the process of depositing copper electrolytically in the form of sheets and tubes direct from the matte or precipitate. The result of the latest experiments in that direction, which from a laboratory point of view seemed to be a success, was given in a column article in the issue of Nov. 18th, '99.

USEFUL minerals are constantly being found in the Western mining regions and frequent projects made for their supply, but not always of commercial value, because cheaper supplies can be imported, ofttimes as ballast, and nearly always in such a way as to enable their being laid down at less cost than furnished from American sources of supply.

UNDER Russian law all gold and silver produced in that country must be registered and brought to the Imperial Mint, which has agencies for its reception established at convenient points. It is probable, however, that a considerable amount of gold is concealed or otherwise fails to reach the Russian Mint. The '99 product is estimated to have been $10,000,000.

THE great drawback to Western Australian gold fields is lack of water. Dry processes do not work satisfactorily; dry crushing by rolls never works well with ore containing talc and kaolin, going into a fine impalpable powder, and stamps, plates, pans and slimes need plenty water. Water is the one thing needful to make that gold mining region a prosperous one.

BISMUTH output and price is said to be controlled by a "ring," composed of the ore producers, the Government of Saxony, and Johnston, Matthey & Co., of London. Each mine can participate in the annual sale proportionate to its producing capacity. This arrangement is said to be in existence since January, '97, with satisfactory results to the producers and vendors.

THE latest meeting of the American Institute of Mining Engineers was held in San Francisco last September. The next meeting will be held in Washington, D. C., February 20, 1900. Hon. Charles D. Walcott, Director of the United States Geological Survey, is chairman of the local committee and Mr. E. W. Parker, Chief Statistician of the Survey, secretary of the local committee.

THE circulation of this paper is limited to mining men, to whom it is generally acceptable. It is believed that this paper weekly reaches more mine owners, mine officials, and men interested in mining than any other publication, and is thus the best advertising medium in the United States through which manufacturers of mining machinery and supplies can make their business known.

UNDER a recent ruling by the U. S. Land Office, in all selections for unsurveyed lands under the Act of June 4, '97, notice of the selection must be given for a period of thirty days by posting upon the land and in the local land office and by publication at the cost of the applicant in a newspaper designated by the register as of general circulation in the vicinity of the land and published nearest thereto.

VISITORS to San Francisco will find at this office, sixth floor, 330 Market street, papers from all parts of the world, books of reference and facilities for correspondence. Mining men passing through or sojourning in San Francisco are cordially invited to make this office their headquarters while here. They can have their letters addressed care this office, and promptly receive them upon arrival.

AT the quicksilver mines of the Asturias, in Spain, the ore does not average more than $\frac{1}{10}$ of 1%, it being thus necessary to treat five tons of ore to produce one flask of quicksilver, and, hence, requires very careful treatment. The percentage of quicksilver in the New Almaden, Cal., mines is greater. At the Guadulupe and El Quiote mines at Guadalcazar, San Luis Potosi, Mexico, the ore averages 1%.

TIN, with a little silver added, makes a solder for aluminum. The solder is heated till it melts, and applied to the warm surfaces of the aluminum with a brush of aluminum wire; then the two surfaces of aluminum are pressed together. Delecluse employs a solder of tin, 48 parts; zinc, 24; lead, 24; aluminum, 3½; chromium, ½ a part. Biesalbert uses one of zinc, 56 parts; tin, 28; aluminum, 9; nickel or silver, 7 parts.

NO miner or engineer ever learned, or ever will learn, practical mining or engineering from a book, and sets of questions forming a sort of catechism, with more or less appropriate answers, even if learned "by heart," will not make a miner or engineer of any one. These things have their place and possess some merit, but nothing can take the place of actual work and experience. And no one who never made a mistake ever amounted to anything, in mining or anything else.

THE Comstock, Nevada, lode yielded over $150,000,000 gold. In the palmy days of bonanza, Con. Cal. & Va. ore went 46% gold, 54% silver. At Silver City, five miles south of the Comstock, gold has been mined for forty years. The richest mine in the State is the De Lamar gold mine, in the extreme southeastern part of the State. Nevada has been described as "a sucked orange," but mistakenly, and that commonwealth will yet come to the front.

THE article on mine ventilation in last week's issue is conclusive answer to G. L., Tesla, Cal. Miners deceive themselves when they place entire reliance upon a copious supply of ventilating air with its consequent high velocity, for the most markedly conspicuous feature of all extensive mine explosions is the fact that roads which are not haulage ways, and through which the air courses at only moderate velocities, are exempt from the effects of explosion.

IN electrical work, increasing the distance, and, consequently, the length of wire, (other things remaining the same), will proportionately increase the distance and the loss of power; but, if the cross-section of the wire is increased in the same proportion as its length, the resistance and loss will remain the same. This, however, increases the weight of the wire as the square of the distance. Hence the law: For a given power and electromotive force (which fixes the current), the cost of copper, for a specified percentage of line loss, varies as the square of the distance. The final deduction: If the voltage is increased in proportion to the distance, the cost of wire for transmitting a given power with a specified line loss remains constant.

PLACER DEPOSITS usually rest upon comparatively hard rocks, often schists, slates and shales, which are eroded in most instances, and show clearly the effects of the gravel-laden streams that ran over their surfaces, especially when, as is often the case, these old formations that constitute the bedrock of the gravel deposit have been tilted up at high angles. The bedrock is often altered and softened by the action of the water for a foot or two below the bottom of the alluvial deposits.

THE Siemens & Halske electrolytic method of deposition is adapted to some ores. It is effected by passing the gold-bearing cyanide solution slowly through vats or troughs filled with alternating anode (iron) and cathode (lead) plates, which are allowed to remain undisturbed for several weeks, when the cathodes, plated with gold, are removed, melted and cupelled. About 8000 square feet of cathode surface is required to electrolyze 100 tons of solution in twenty-four hours. The consumption of current is small, 4 or 5 electric H. P. sufficing to run a large plant.

THE Sheffield Technical School, from elaborate experiments, has discarded the idea that the reason that a red-hot steel becomes flint hard when suddenly quenched in water is that the shock drives the molecules of the steel into closer contact, occasioning hardness. The metallurgical department of that school claims to have demonstrated that the hardness of such quenched steel is due to the presence of a sub-carbide of iron, and that the temperature is due to the fact that far below red heat this compound decomposed and diluted the mass of soft iron. It is also asserted that the permanent magnetism of steel depends upon the amount present in the compound.

A 24-INCH BELT running 250 feet per minute would carry per hour about 93 tons of material, weighing 2700 pounds per cubic yard. The belt being 24 inches wide, the load may be considered as a triangle standing on its apex, with a base 12 inches wide and a height of 3 inches. Therefore, the area on its cross-section will be 18 inches, and there will be 18x12=216 cubic inches, on each foot of the belt. If the speed be 250 feet per minute, there will be delivered from the end of the belt 250 times 216 cubic inches, or 54,000 cubic inches per minute, or 31¼ cubic feet per minute, or 1875 cubic feet per hour, weighing 187,500 pounds if 100 pounds per cubic foot, or about 93 tons hourly. If the width of a belt is double it will carry four times as much material, and if tripled, nine times as much.

THE ordinary method of reducing zinc by distillation depends upon the fact that it volatilizes at its temperature of reduction. The boiling point of a liquor depends upon the pressure, so that by increasing the pressure in the furnace it should be possible to prevent the volatilization of zinc. The necessary pressure is the vapor pressure of zinc at its temperature of reduction (or at the temperature of the furnace). At 76 cu. cm. pressure the boiling point of zinc rises about 1.5° C for each centimeter, so that the vapor pressure of zinc may be estimated at about five atmospheres at 1,500° C. However, this temperature is never obtained in zinc furnaces; probably 1,200° would be average. Besides, zinc and lead alloy at high temperatures. Hence, a pressure of three atmospheres should suffice.

WHEN poured into a mould in a state of fluidity cast iron expands at the moment of solidification, thus giving a sharp impression in the mould. The expansion, slight but noticeable, extends, until, in the process of cooling, the iron attains the stage of red heat. Concentration then takes place, with the result that the cooled iron is noticeably smaller than the mould. In making patterns for iron castings, therefore, pattern makers commonly allow about one-eighth of an inch per foot for shrinkage. The shrinkage in castings, however, is not a constant: it varies materially with the proportion existent in the pattern and the character of metal used, as much as one-tenth of an inch per foot being allowed when casting iron beams and about one-thirty-second of an inch in casting large cylinders. Charcoal iron has a higher melting point than that of less pure iron made with coke.

DRY amalgamation of gold has long been "an iridescent dream," the nearest solution of that metallurgical problem having been some time ago afforded by a London inventor who contrived a machine consisting of an iron tube 4 inches in diameter, bent into a spiral form of four turns, with suitable connections. In the bottom of each spiral turn eight pounds of mercury is poured, forming a pool, but not closing the pipe. A blower is attached to one end of the tube, near which is a feeding hopper, the other end being connected to a dust settling chamber. The intention is to blow the finely crushed and absolutely dry ore through the spiral and over the mercury pools. These latter are dashed about, and sprayed by the action of the air current, and the particles of ore are brought into contact with the mercury, which amalgamates and retains the gold. The gold which escapes the pool in the first spiral is carried along to the second, third and fourth, and by the time the ore has run the gauntlet of these four, it is said to have parted with the bulk of its gold contents. At the end of the run the mercury is taken out, the amalgam extracted and retorted.

The Switzerland of Colorado.

Written for the MIN NG AND SCIENTIFIC PRESS by T. A. RICKARD, State Geologist of Colorado.

In no part of the world have the picturesque vicissitudes and rude realities of mining received so telling an illustration as in that mountain land which has made the poetry of Colorado history. The "Silvery San Juan," as it was proudly called before the days of 1893, includes six counties, in the southwestern corner of the State, whose melting snows drain into the San Juan river, a tributary of the darkly flowing Colorado. It is a region outside the beaten track of tourist travel and therefore is but vaguely known to many as suggestive of rich mines and thundering snowslides inextricably blended in a mist of romance. Nevertheless it is as interesting to the men of affairs as it is attractive to the artist. No mining country so well illustrates the application of technical science to industrial development, and in no region has the resistless energy of American enterprise found a more magnificent field.

Only those who have climbed over the ranges can have a true appreciation of the intrepidity of the men who ply their calling far above that line which, like the shore of an ancient sea, stops the aspiring pines from trespassing upon the trackless snowfields. The ranges have long since been invaded beyond this "timber line," and many a wreath of smoke tells of the fact that the unresting wheels of ponderous machinery have been put to work where once the mountaineer scarce ventured. We hear much of the pluck and daring of the men who traversed the desert and

The Pioneers of the San Juan on the Mountain Trail, Baker's Park, Colorado.

penetrated the recesses of the Sierra Nevada, but it has often required more skill and courage to go ten miles among the snowfields of the San Juan than to roam the whole length of the hills which Bret Harte has illumined with the afterglow of his romance.

An early Government report records the opinion of a departmental surveyor that the canyon of the Animas below Silverton would remain impassible to man and mule. Even the cat-like Indian climbed the cliffs and passed over the high plateau rather than invade the gloomy defile which had won for the river its Spanish name of "Rio de las animas perdidas," the river of lost souls. The redskin, the trapper and the miner each in turn avoided the inferno of that dark and tumultuous gorge, yet to-day the overhanging cliffs echo the shrill scream of the locomotive and the train glides smoothly from the Cimmerian gloom into the sunlit gladness of the open valley. First came the trail of the hunter, then the pathway of the surefooted mule, and when a long succession of heavily laden caravans had brought down enough valuable ore to incite the ambition and cupidity of larger minds, the toll road was surveyed with a view to its ultimate utilization as the gradient for a railway.

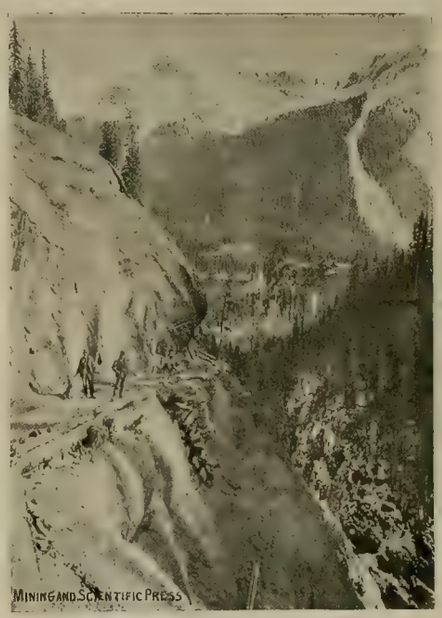
Such was the evolution of the transport system of the San Juan, and nothing better illustrates that adaptation to environment which characterizes all intelligent development. The commercial results have been striking, as can be sufficiently instanced by a few figures. In 1876 ore was carried by mules to Del Norte and thence by train to the smelter at Pueblo. The cost was $80 per ton. At the present time the freight is $8 per ton.

The penetration of the railroads into the mountain fastnesses has made a network of intercommunication which has permitted of the growth of smelting

Cathedral Spire, San Juan, Colorado.

centers at Silverton and Durango, particularly the latter, whose excellent coking coal enables it to meet the competition of the larger establishments across the range. And thus, in the course of time, difficulties have been overcome and hindrances removed until an extremely varied mining and metallurgical industry has been built up in the very heart of the once untrodden mountains.

The mines of this alpine country present many features of interest. The utilization of the energy of the mountain torrent and the transmission of power as electricity have diminished the difficulties due to inaccessibility, while at the same time the installation of wire ropeways of approved design has enabled the miner to derive a benefit from the difference of altitude and to obtain a cheap and most efficient method of transport. The late adoption of the multiphase current system has widened the field open to the electrician, and the lessened first cost of the Otto and Bleichert tramways has induced many to erect them. The results have been notable in many ways.



If you should happen to be among the mines when day is fading you will find the twilight magic with strange sights and sounds. Let me take you, for instance, to Savage basin near Telluride, a locality distinguished for successful mining. As you look towards the entrance of the mountain amphitheater the rugged peaks on either hand frame a picture completely typical of the great mining empire of the West. The sun has set. The snowclad summits, grey with an age beyond mortal imagining, in serene grandeur pierce the quiet of the darkening sky. Beyond, the light of day lingers upon the thread of the San Miguel river as it hastens down the valley and is lost amid the gloom of the overshadowing mass of Mt. Wilson. The hills, like flocks of unregarded sheep, cluster on the edge of the fading plains of distant Utah, where the mantle of night had already fallen. As sights become faint sounds become stronger. The sudden whistles from many engines announce that it is six o'clock. Groups of miners emerge from numerous shafthouses. A regular murmur as of machinery

Mount Abram, Colorado.

in motion draws attention to a bucket gliding along a steel rope overhead. Others succeed it in distanced procession, and the catenary curve of its flexible way makes a clear line against the snowfields. If you listen you can hear the noise of loading at the upper terminal, half a mile away, and by watching the descending buckets you can see them disappear down the hillslopes leading to the mill whose muffled thunder comes and goes like the voice of the sea when heard far inland. The darkness has obliterated the outlines of the landscape and yet the night is quickened with life and animation. The electric lights of distant shafthouses and mills dot the encircling hills and proclaim the unceasing activity of man. What a change from the quiet which brooded over these ranges scarce a generation ago! The sullen silence of the upper snowfields has vanished forever; the ambition of man, aided by the universal hunger for gold, has led his restless footsteps to the very cathedrals of the earth where now he pierces the sunlit surface to delve in the darkness for those things prepared for him since the beginning of the world. As you trace the faint outlines of the range, coronetted now with the glowing brilliancy of the multitudinous electric lights born of the energy of a far-distant torrent, as you hear the throb of machinery stealing over the snowfields, you realize something of the conquering energy of man.

The picturesque appearance of the San Juan is due to its geological structure. Analyze the anatomy of a mountain land and you will find that its external beauty of form is traceable to the unseen arrangement of the underlying rocks. The rugged peaks of the Ophir and Mt. Sneffles ranges have been sculptured by the patient hand of Time from the shapeless mass of a very peculiar rock. It consists of a series of tuffs and breccias, the consolidated fragments of a volcanic rock whose name has lately become popu-

On the Mt. Sneffels Road, San Juan, Colorado.

larly familiar because it characterizes the ore formation of Cripple Creek. I refer to the "andesite," originally so named on account of its prevalence among the Andes of South America, and now known to be a rock enclosing a great variety of very valuable ore deposits in different parts of the world.

As you examine the sides of the mountain amphitheaters of this region you will notice a regular arrangement, as of bedding, among those compacted remnants of another age; and in truth there is reason to believe that these volcanic ejectments were laid down under water, having been deposited in a lake bordering the scene of Plutonic activity. This formation has a thickness of many thousand feet and is traversed by ore-bearing fissures which have made it the scene of very extensive mining operations. The breccia has been penetrated by dykes of later andesite, and along the passageways so created mineral-bearing waters have laid down their freight of precious metal. Such in a general way are the geological conditions obtaining in the Telluride and Red Mountain districts. In other neighboring localities the later volcanic rocks have formed huge underground cores and where they reached the surface they have spread in thick masses which in succeeding times have been so shattered by earth movements as to become the channels for underground circulation and the consequent receptacle for ore deposits. The La Plata mountains and the hills guarding the upper Animas afford numerous studies of this type of structure.

These volcanic rocks belong to the dawn of the Tertiary period and are approximately contemporaneous with the andesites and phonolites of the Pike's Peak region. They overlie the earlier sediments in which also ore has been found. At Rico, for instance, gold and silver are won from the Carboniferous shales.

Although we can thus label the rock enclosing the veins, we cannot assert the age of the ore deposits which have been formed within them. There is evidence, however, pointing to an origin which is related to the intrusion, among the shales and limestones, of a volcanic product now appearing as dykes and intercalated sheets of porphyrite.

The geological distribution of the precious metals in

The Bridal Veil Valley, Colorado.

this part of Colorado is a wide one, ranging from the Silurian schists to the Cretaceous shales; and, as in other regions, testimony is accumulating that the geological structure of the country is more decisive as to mineral impregnation than the age of the rock formation. The shattering of the older formations by the penetration of the newer volcanics has been a prime factor in the opening up of those underground

Marshall Basin and the Sheridan M. Mine, Colorado.

passageways, whether a series of irregular cavities or only a line of maximum porosity along which ascending mineral solutions have circulated and have deposited the metal in a manner determined by local conditions.

As yet the knowledge of the cause determining the presence of ore in one place and its absence in another is unsatisfactory and inexact, from the very

Rotary Snow Plow at Work at Ivanhoe, Colorado Midland Railway.

nature of the inquiry, but in the meanwhile the geologist has deciphered the rules of faulting and other disturbances of the rocks which interfere with mine exploitation, and is thus able to give the toiler underground an aid measurable in the one appreciable unit—dollars and cents. Be patient. Geology is but young, a child that takes by the hand the old industry of mining, leading his blind and faltering footsteps through the darkness of the under world. "Science moves but slowly, creeping on from point to point." Geology is destined to do greater things when those who direct mine exploration invoke its aid intelligently and with patience; when, from being a weird abracadabra of speech, it will prove a beneficent assistant to one of the most useful occupations of a busy humanity.

Telephoning With Telegraph Wires.

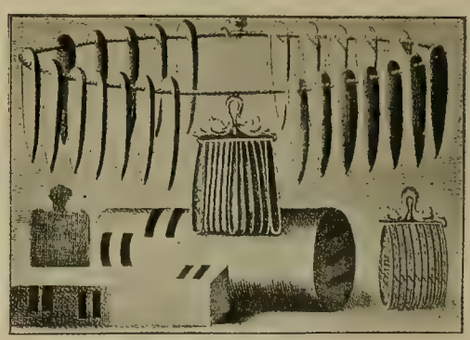
Long distance telephone lines are now used simultaneously for both telephoning and telegraphing without interruption or trouble to either system. To illustrate the value of the scheme, it may be said that a wire between two large cities, distant 1000 miles, is leased to a brokerage firm for telegraphing. The same circuit is used by the telephone company for connecting parties between the same cities who desire to converse by long distance 'phone. There is no interference with either the telegraph or telephone arrangement, although both may be in use at the same moment. Even an expert cannot tell when the line is doubled up.

For long distance telephoning two wires are always used, forming a metallic circuit. This is done to avoid the ground currents and ofttimes troublesome induction from electric light and trolley wires when the earth is used. The doubling up plan can be utilized on any metallic circuit at little expense by using a condenser formed by strips of tinfoil running parallel and close together without touching. The strips, which are enclosed in an oblong box about 2 feet long, are insulated with strips of paper placed between them. The condenser acts as a sort of electrical accumulator. After an electrical current has passed through the tinfoil strips they retain a certain amount of the electricity. The current thus induced is sufficient to transmit the human voice.

From each side of the telegraphic key, as used in connection with a telephone circuit, a wire is run to the condenser, which forms what may be termed a telephone bridge. While the key really opens and closes the main line circuit the voice of a person using the telephone travels by way of the bridge, or condenser, at periods when the line is open at the telegraph key. By means of the induced current and condenser the voice goes around the telegraph key, which is transmitting Morse signals by breaking and closing the circuit on the main line. Not enough current, however, will jump through the tinfoil strips in the condenser to affect the telegraph instruments on the line.

Colorado Dam Construction.

A dam is building at the entrance to South Platte gorge, forty-eight miles south of Denver, Colo., to form a reservoir with a capacity of 35,000,000,000 to 60,000,000,000 gallons of water. This reservoir will be in an irregularly shaped basin, at present cut into many patches by masses of red granite 100 to 500 feet in height. Its greatest width will be about one and one-quarter miles and it will extend seven miles up the Platte and three miles up Goose creek. The water will be 200 feet deep at the dam, 150 feet deep three miles away, and 50 feet deep six miles away. The dam will be 210 feet high and can be increased in the future to a height of 230 feet. It will measure about 25 feet from side to side at the base, and for some 50 feet upward will not exceed 50 feet in frontage. From this point it will increase in length until, at the top, it will measure about 500 feet. The face of the dam is to consist of a shield of steel standing at a slope of one-half to one. This is to be made of steel plates, each 5x10 feet and ⅜ inch thick and thoroughly coated with asphalt. These are to be riveted to steel beams embedded in the granite foundation, extending from the bottom to the top of the dam. Back of the steel plates is to be 2 feet of concrete and then 15 feet of granite blocks. Back of this will be granite boulders blasted directly from the sides of the gorge or dropped from low cars run out on a temporary bridge across the gorge. The width of the dam at the base is 240 feet. There will be three outlets for the surplus water when the reservoir is full. The first is a tunnel cut through the north buttress of the dam. This measures 6x7 feet on the upper half and 8x9 on the lower, and is ample for the normal flow of the stream. It is controlled by valves placed in a gallery at right angles to the tunnel. A second tunnel starts from the 110-foot level of the reservoir and pierces the granite buttress at an angle of 45°. This is 6x7 feet and is intended to be the main wasteway. The discharge of this tunnel will furnish water power to be utilized by an electric plant. In a depression between two masses of granite about 600 feet north of the dam is a large natural spillway, on the 200-foot level, which will be used in time of floods. The corporation owning this property is the South Platte Canal & Reservoir Co.



The Bodies We Live In.

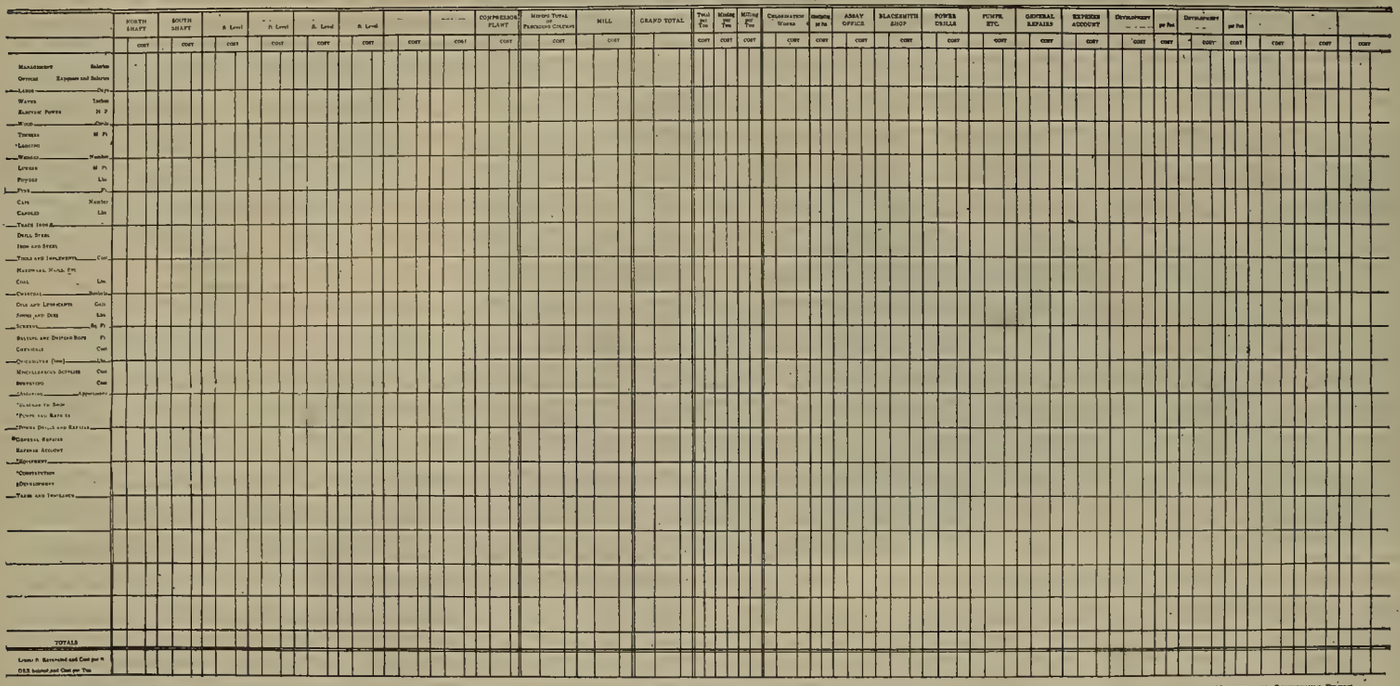
During life each member of the body, in the act of living, produces poison to itself. When the poison accumulates faster than it can be eliminated, which always occurs unless the muscle has an interval of rest, then will come fatigue, which is another expression for toxic infection. If the muscle is given an interval of rest, so that the cell can give off its waste product to keep pace with the new productions, the muscle will then liberate energy for a long time. This latter condition is what we call endurance.

The power and endurance of the human machine are limited, according to our understanding of the above facts, and also our recognition of its slowness in getting started. Like any other intricate machine, the body requires time to get in harmonious working order. The brain, nerves, heart and skeletal muscles must be given some warning of the work they are expected collectively to perform. Ignorance of this fact has broken down many a man. The necessity of getting all the parts of the body slowly in working order is well understood by trainers and athletes, although it is doubtful if they could give any physiologic reason for the custom.

Ancient Goldsmith's Tools.

For the assayer of the present day the little sketch shown on this page, from Cassier's Magazine, has a peculiar interest. It was reproduced from the old volume of Pettus on "Metals," and represents a set of touch-needles and touch-stones of the kind used long years ago for determining the degree of fineness of any particular object of gold. The illustration

Ancient Goldsmith's Touch-Needles.



practically tells its own story. Each of the several needles represented a special and known degree of fineness, and a mark, made with it upon the touchstone, served as a standard for comparison with another mark made by the sample of gold to be tested. The approximation probably was close enough, and the outfit evidently served its purpose well.

The Diesel motor, which was the subject of a page illustrated article in the issue of Nov. 12, '98, was described by Col. E. D. Meier in a lecture delivered at the junior meeting of the American Society of Mechanical Engineers in New York City on the 2nd inst. In speaking of the work contemplated by the manufacturers of the engine he stated that, while originally constructed from German designs, it had been entirely remodeled and simplified to accord with American methods of conetruction. Two the motors, which will not be made smaller than 20 H. P., have been sold, one to a firm in Worcester and another to one in Jersey City. Two more are on the testing block and about ready for shipment.

A new terminology is agreed upon for the floor of the ocean, viz.: Caldron, a wide, deep depression; basin, deep depression, with sloping sides; furrow, a narrow depression; trough, a narrow depression, with steep sides; wall, a steep slope; floor, a gentle submarine slope; elevation, any inequality above the general level; bank, a relatively wide elevation; shoal, five fathoms; shelf, a horizontal bank.

MINING AND SCIENTIFIC PRESS

Bookkeeping for Mines.

Written for the MINING AND SCIENTIFIC PRESS by S. I. HALLETT.

The need of employing an intelligent system of bookkeeping on mines is, unfortunately, far too much overlooked. To a mine manager, bookkeeping as a means of gaining information about what he is doing certainly comes next to assaying, while to the stockholders in a mine there can be nothing more appreciated than a clear, condensed report of each month's work, the yearly report merely being the sum of those issued every month, and thus giving a greater and better average than can be obtained by one month's work.

The annual reports of most mining companies differ each from the other, there being no regular system, and varying all the way from mere memoranda to a flood of figures that might be intelligible to an expert, but that, without long study and digging out of facts, convey but little meaning to the lay mind. How many reports of a mine's operations do we see, either quarterly or monthly, that cover pages of figures and from which it is impossible to glean whether the mine has made or lost money. Possibly at times this is intentional, but usually it is not. A short, clear, condensed statement, that can readily be seen through, is certainly of great benefit, while to the manager of a mine it is almost indispensable that he should know each month the cost of the separate workings, where the items came from, with their totals, the cost of running drifts or shafts per foot, the cost of getting out his ore by the ton and cost of pumping water or hoisting, and then, if he knows his business, he can readily tell if the men are doing the work as it should be done and as cheaply.

It will really, in place of adding to a manager's work when he gets such a system established, save him an immense amount of labor. It will also call his attention to many leaks and extravagances that do not show unless brought out in detail, when, of course, he will at once correct them.

The fact, too, of having these reports on each part of individual work on the mine acts as a stimulus to the men, especially if one or more crews are brought into competition.

There is no trouble about starting such a system. Any mine large enough to afford a timekeeper can readily do it. When the day's work is done, either one shift or two or three, a report by the shift boss handed to him with the supplies issued shows where all and each piece of work is done. Keeping these, at the end of each month he checks his payroll by it. Of course, there will be some mistakes, but not many, in which case he will simply have to force his balance.

The accompanying blank statement is that of the system used on the Smuggler, giving an idea of the system, which, simple as it is, took some time to elaborate. For example, by adding up the column marked "Mining" from top to bottom, you get the total of that branch of the cost, while by reading from left to right you get its individual cost on each piece of work.

A number of possible ledger accounts have been put down at the left that of course would be made suitable according to the work done on each mine. By adding this statement to your outside accounts, it will check the regular monthly cash statements.

Aspen, Colo., Dec. 29th, 1899.

In order to insure a complete and satisfactory system of mine bookkeeping, supplies from various departments, such as the warehouse, the timber, lumber and fuel yards, should be issued only by persons authorized to do so, and he should know where the supplies are to be used and make a memorandum thereof, and such supplies should only be issued upon orders made by those having authority to make them. The materials so issued will then be properly

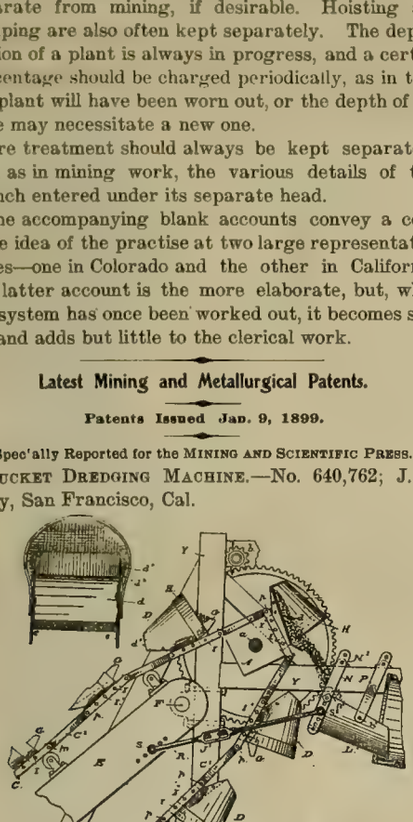
checked and appear each in its proper account.

The segregation of the various departments and branches of the business is an absolute necessity in mine bookkeeping. There is always a general expense account, which includes office expenses, insurance, taxes, engineering, etc. A construction account is essential, if buildings, tanks or other structures be erected, and a maintenance account will necessarily follow, which will include repairs to buildings, bridges, trestles, tracks, tanks, etc. The mining account is, of course, a most important factor, and it may be subdivided into such departments as may be desired. Shaft sinking should be kept apart from drifting, tunneling, etc., and stoping and deadwork are separate branches of this account. The mere statement of profit or loss in calculating mining operations does not convey to the owner the information he desires and should have, and the only way in which to obtain the detailed information is by the segregation of accounts. Timber account may be kept separate from mining, if desirable. Hoisting and pumping are also often kept separately. The depreciation of a plant is always in progress, and a certain percentage should be charged periodically, as in time the plant will have been worn out, or the depth of the mine may necessitate a new one.

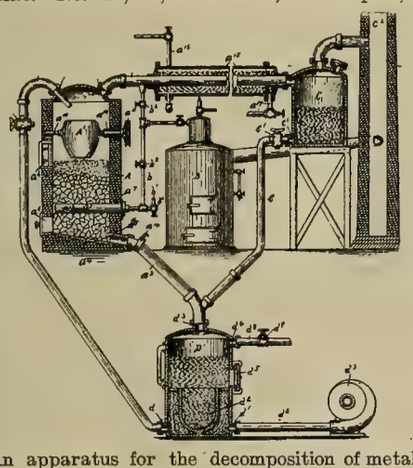
Ore treatment should always be kept separately, and, as in mining work, the various details of this branch entered under its separate head.



The accompanying blank accounts convey a complete idea of the practise at two large representative mines—one in Colorado and the other in California. The latter account is the more elaborate, but, when the system has once been worked out, it becomes simple and adds but little to the clerical work.

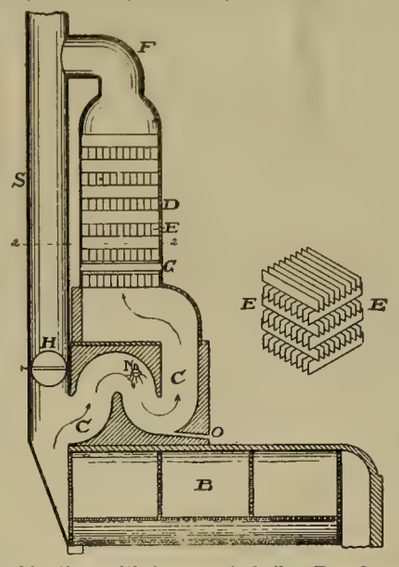
Latest Mining and Metallurgical Patents.

Patents Issued Jan. 9, 1899.



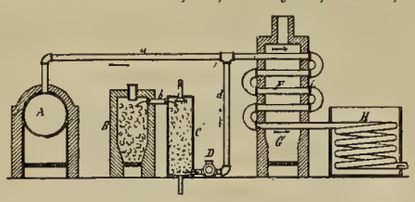
Spec'ally Reported for the MINING AND SCIENTIFIC PRESS.

BUCKET DREDGING MACHINE.—No. 640,762; J. H. Gray, San Francisco, Cal.



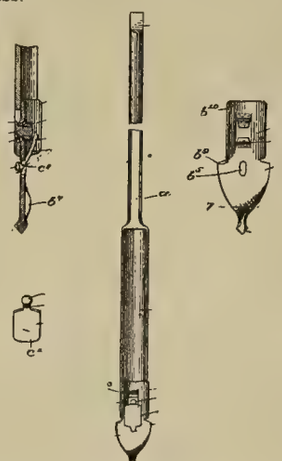
A dredging machine combination, a pivoted bucket carrying frame, adjustable in a vertical arc, a tumbler above pivot, and an endless chain of buckets; in a chute suspended from points of oscillation beneath mouths of buckets and with relation to the path in which they travel to receive the material from the buckets and means connecting chute with pivoted frame, consisting of the rods pivotally attached to chute and to frame, below their pivots, with means for adjusting the length of the rods.

PROCESS OF AND APPARATUS FOR MAKING CHLORIDE OF ZINC.—No. 640,908; H. K. Hess, Philadelphia, Pa.



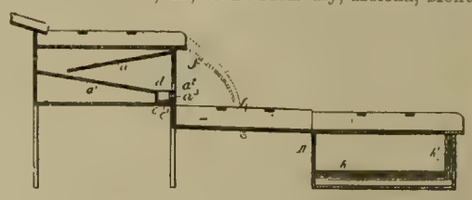
An apparatus for the decomposition of metalltic chloride in the manufacture of hydrogen gas, combination of furnace for decomposing metallic chloride and forming hydrochloric acid, an inlet conduit for supplying steam to interior of furnace for conducting the hydrochloric acid therefrom; steam conduit for discharging steam into the outlet conduit, means for cooling outlet conduit, receptacle for receiving acid from the outlet conduit, a second receptacle for receiving metal liberated in furnace and hydrochloric acid which unite to form a metallic chloride and generate hydrogen gas, and a conduit for conducting acid from the first receptacle to the second.

SMOKE PREVENTING DEVICE FOR FURNACES.—No. 640,796; W. Neuhs, Cleveland, Ohio.



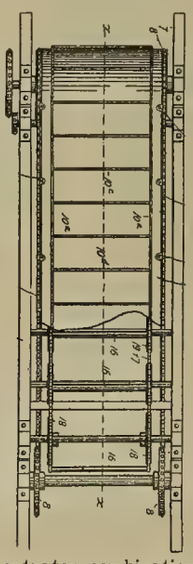
Combination with furnace A, boiler B and stack S provided with damper H, of the curved or S-shaped flue C, standing on or near the boiler, and in open communication with the stack, having outlet O, stack D having open cross tubes G, and cross strips E forming checkered open work within, the top of the stack D also in communication with the stack S; a water sprayer N in the flue C.

METHOD OF REFINING PETROLEUM AND PETROLEUM DERIVATIVES.—No. 640,918; A. Kayser, Buffalo, N. Y.



Method of refining ill-smelling or sulphur-bearing petroleum or petroleum derivatives, which consists in distilling same by application of heat to still, mixing carbon monoxide with oil vapor, and heating mixture of oil vapor and carbon monoxide to temperature necessary for causing carbon monoxide to react upon the objectionable compounds in the oil-vapor.

PROSPECTING DRILL. — No. 640,928; D. McCabe, Boston, Mass.



An earth drill having at its lower end a semicylindrical portion for retaining a sample of earth, a separable boring blade, comprising a shank curved to fit within semicylindrical portion, a boring portion below shank tapering to a drill point at its lower end, and having at its upper end a vertically elongated slot, and a lifter movably mounted in slot having a broad shovel-like lifting end, and a reduced neck having substantially parallel sides fitting within elongated slot and serving to maintain lifter in proper upright position while permitting it to swing up and down in the slot, and a retaining head at the outer end of neck and behind slot, with means for detachably securing boring blade to semicylindrical portion.

APPARATUS FOR TREATING PLACER ORES AND SANDS.—No. 650,929; J. P. McEvilly, Helena, Mont.

An apparatus for collecting float gold, consisting of a runway of relatively fixed initial and terminal casings or closures arranged at different levels, each having a top screen of different-sized perforations, the fixed perforated top of the terminal casing connected with the inclined imperforate bottom of the initial casing by an intervening sluice, a mercury-containing tank transversely in the initial casing at the junction of the latter with sluice, a mercury-containing tank arranged in the terminal casing at right angles to the initial tank and having a transversely concaved bottom, the initial inclined bottom terminating in a screen for the initial tank, an opening in the casing wall at screen, an overflow opening in the tank and an opening in the casing registering with tank overflow opening, the openings discharging into the sluice, an overflow opening at the outer end of the concave tank and riffles having their lower edges on a level with the bottom of the overflow opening, their upper edges having a graduated relation to the top of overflow opening.

ORE CONCENTRATOR.—No. 641,248; A. Ten Winkel, Denver, Colo.

In an ore-concentrator combination with suitable frame provided with sprocket wheels at both extremities and chains engaging wheels, of an endless apron impervious to water, attached to chains at suitable intervals and left sufficiently slack to form pockets, transverse riffles attached to apron, each pocket having a riffle at each extremity and one or more intermediate riffles, the mechanism being so arranged that the mineral is carried upward with the apron and the gangue downward by the flow of the water.

Popular and Reliable.

THE MINING AND SCIENTIFIC PRESS has begun its eightieth half-yearly volume, and in honor thereof, possibly, is printed from beautifully clear new type produced by a Mergenthaler, we judge. The PRESS is Western mining authority, and it is doubtful if it has a superior in the world as a popular and reliable journal in in its line. Many more years to it.—Inyo, Cal., Register, Jan. 11.

A Colorado Opinion.

THE MINING AND SCIENTIFIC PRESS, of San Francisco, is the very best mining publication printed, and has a circulation that covers the civilized world. —Telluride, Colo., Journal, Jan. 13.

THE London Daily Mail's Cape Town correspondent says that the experiments with the Marconi system of wireless telegraphy between DeAar and Modder river have met with small success, the iron in the hills beyond Enslin playing all sorts of pranks with the system.

Cyaniding in New Zealand.*

NUMBER II.—CONCLUDED.

Written By JAMES PARK, Thames, Auckland, N. Z.

WET CRUSHING.—For ores containing a large proportion of free, easily amalgamable gold, with a certain proportion of fine or "float" gold and silver sulphide, the mill practice is:

(a) Crushing with water.
(b) Plate amalgamation.
(c) Spitzlutte separation of sands and slimes.
(d) Cyanide treatment of sands and slimes by ordinary percolation.

A typical example of an ore of this class is that of the Kauri Gold Estates at Opitonui, where a new 40-stamp mill has just started. The sands and heavy slimes are subjected to the "double" cyanide treatment; but it is doubtful if the additional saving will pay for the extra labor involved. So far, no provision has been made for the treatment of the fine slimes. If they are worth it, they will probably be treated by agitation and decanting.

For a clean ore, almost identical with that described above, but containing a small proportion of free amalgamable gold, and a large proportion of fine cyaniding gold, with little or no slimes, the method of treatment at the Crown mines is:

(a) Crushing with cyanide solution.
(b) Direct cyanide treatment of mixed sands and slimes by percolation.
(c) Plate amalgamation of gold.

With an ore so exceptionally free from slimes, it seems that the order of treatment could be reversed with advantage, as regards both stamp duty and efficiency of amalgamation on the plates.

The Crown Mines Co. was the first (in 1897) to adopt wet crushing for these gold and silver bearing chalcedonic ores.

The ore is hard and splintery, clear and free from all impurities, and, unlike most of the ore from the neighboring mines, contains little or no silver, except what is alloyed with the gold. It is crushed in the company's 60-stamp mill with cyanide solution in the mortars, about $2\frac{5}{10}$ tons of solution being used to one ton of ore. A 25-mesh screen is used, and the duty per stamp is about two tons per day. The slimes formed in crushing are said to amount to less than 5%. The monthly output is about 2750 tons. In the month of June last, 2900 tons were crushed, yielding 3037 ozs. 5 dwt. of bullion, valued at £6069 14s 8d, equal to a fraction under £2 per ounce.

The cyanide plant consists of twenty-eight leaching vats, each $22\frac{5}{10}$ feet in diameter and 4 feet deep. Much reticence is maintained as to the exact treatment; but the main features are understood to be as follows:

The whole of the pulp from the sixty stamps is conducted by a launder to one vat, and allowed to discharge into the center until the vat is about half full. The pulp is then diverted to another vat, which is allowed to fill in the same manner. The mixed sands and slimes in the first vat are allowed to settle for an hour or two, after which the fairly clean top solution is syphoned off into a collecting tank, whence it is pumped up to two elevated tanks, from which the solution for the stamps is supplied. The pulp is again diverted into the first vat until the charge is complete. After settlement, the clear top solution is again drawn off. In this way three or four vats may be in course of filling at the same time.

The settlement of the slimes is effected without the aid of lime by allowing the solution to percolate from the bottom of the vat during the filling and periods of settlement. The downward currents promoted by the draining from below are said to promote the settlement of even the finest material within a reasonable time. This is a point to be noted by cyaniders troubled with slimy products.

The mixed sands and slimes are treated by percolation in the ordinary way. The depth of each charge is about 30 inches and the weight forty tons. The strong cyanide solution is allowed to percolate from thirty to forty hours, while the week cyanide and water washes are drawn off by the aid of an air pump.

The syphon used in the sand vats consists of $2\frac{5}{10}$-inch rubber hose, to one end of which is attached a short length of wooden batten, to keep it on the surface of the solution. The other end is fixed, inside the vat, to a short iron pipe passing through the side, about 18 inches above the filter cloth.

In the extractor room there are five precipitation boxes of the ordinary pattern, divided into compartments by baffleboards; and four zinc towers, consisting of wooden boxes about 6 feet high and 30 inches square, set on end and connected in a series, like charcoal towers. The solutions flow upwards through the zinc turnings, the overflow being conducted in a pipe to the bottom of the next tower, and so on to the last.

The sands are sluiced out of the vats over a wide expanse of amalgamated copper plates, which catch a certain proportion of the free gold.

The actual recovery from all sources is said to vary from 84% to 87%; but the figures of cost are not obtainable.

For ores containing some easily amalgamable gold and fine gold, associated with pyrites and silver sulphides, the treatment used is:

(a) Crushing with water.
(b) Plate amalgamation.
(c) Spitzlutte separation of fine slimes, if necessary.
(d) Vanner concentration of sulphurets.
(e) Cyanide treatment of sands by percolation.
(f) Cyanide treatment of slimes by agitation and decanting.
(g) Cyanide treatment of concentrates by agitation.

The practise at the Woodstock mill is a typical example of this system, the details being as follows:

The ore is chalcedonic and finely crystalline quartz, containing a small proportion of clayey matter and a little pyrites. It is stained a greyish and blackish brown color through the presence of iron and manganese oxides.

At the company's 40-stamp mill, the monthly output is about 1100 tons, the stamp duty being slightly under two tons of 2240 pounds per day. The value of the bullion varies from 8s to 12s per ounce, being principally composed of silver.

The ore is crushed with water and passed over amalgamated copper plates, from the end of which the pulp is raised by a wheel elevator to a Spitzlutte. The slimes from the Spitzlutte are conducted to a slime tank, while the sands, carrying some slimes, are passed over vanners, which collect about 1% of rich concentrates.

The vanner tailings, composed principally of sands and heavy slimes, are led to the leaching vats, which are provided with automatic distributors. The construction of the distributors is of the simplest character, being similar to that of those formerly used at Waihi. They consist of a central wooden box, pivoted on a wooden pillar fixed in the center of the vat, and from which extend seven light, narrow wooden launders, or arms, of different lengths, so as to effect an even distribution of the pulp. At the end of each arm is fixed a piece of sheet zinc to divert the stream to one side.

The whole of the pulp from the vanner ends is collected in one stream and diverted into one vat at a time, until the charge is filled. During the filling, the overflow carries the lighter slimes into the slime vats.

The sands and heavy slimes are treated with cyanide by ordinary percolation.

The slimes from the Spitzlutte and those from the sand vats are agitated with cyanide in vats provided with slowly revolving arms. When the gold is dissolved, lime is addded, and the slimes are allowed to settle; after which the clear solution is decanted off. The slimes are washed by agitating with successive portions of water, and decanting.

The concentrates have a value of £30 to £40 per ton, a large proportion of the value being in silver sulphide. They are treated by agitation with a 4% solution of cyanide for thirty-six hours. Two pounds of lime are added to every ton of concentrates. The charge weighs about 1.5 tons. Frank Rich, the superintendent, who adopted the present treatment, informed the author that the recovery varied from 90% to 94%, at a cost of 18s per ton for labor and material.

The recovery by cyanide from all sources is said to vary from 82% to 86%, at a cost of 4s 9d per ton of ore milled.

For very slimy ores, containing very little easily amalgamable gold, and a large proportion of extremely fine gold, besides the usual silver sulphides, the treatment is as follows:

(a) Crushing with cyanide solution.
(b) Spitzlutte separation of sands and slimes.
(c) Treatment of sands by percolation.
(d) Treatment of slimes by agitating and decanting.

This method of treatment is subject to various modifications, as regards mechanical appliances and methods of application; but the general principles are the same everywhere.

The procedure at the Waitekauri 40-stamp mill is as follows:

The ore, which contains a good deal of oxidized products, is crushed with cyanide solution in the mortars. From the screens the pulp is conducted direct to the sand vats, into which it is distributed by means of revolving wooden box launders, actuated from a secondary shaft. The slimes, amounting to about 33%, are allowed to drain into the collecting vat, flowing through a pipe fixed into the inside of the vat. This pipe has a movable joint, and is raised by a screw as the pulp accumulates in the vat.

The collecting vat is provided with revolving arms, which keep the fine slimy pulp from settling. From this vat the slimes are pumped into the slime leaching vats, which are provided with a double set of slowly revolving arms, the lower ones having rakes on them, and the upper ones, loose pieces of sacking which drag through the pulp. In these vats the slimes are treated by agitation and decanting, lime being added with each wash to facilitate settlement.

The sands are treated by ordinary percolation with first a 0.5% solution of cyanide, and then with the weak solution and water washes.

There are twelve sand vats, fourteen slime vats and two slime collecting vats, each 22.5 feet in diameter and 4 feet deep. The monthly output of the forty stamps is about 2200 tons of 2240 pounds. The actual recovery is said to be 90%, at a cost 5s 6d per ton.

The exceptionally large proportion of slimes in this ore rendered the adoption of wet crushing a knotty problem. The increased output, higher extraction and lower costs are proofs enough of the success of the change from dry crushing, which was effected under the supervision of G. Davey, the superintendent, without hitch, or decrease in the monthly output.

CONCLUDING REMARKS.—Among the points most likely to attract notice are the low stamp duty and heavy consumption of cyanide.

The low stamp duty of the Ohinemuri mills has often been a subject of discussion; but, to my mind, no satisfactory explanation has been advanced. I am of the opinion that it is due to the circumstance that the mills having been designed and erected in the first place for dry crushing, the mortars are too narrow and restricted to give good results by wet crushing. Until they have been replaced by new mortars specially designed for wet crushing, it seems hopeless to look for better results. The advantages of a stamp duty of four or five tons per day instead of two tons are too obvious to require specification.

Silver in all its forms requires a stronger solution of cyanide to effect its solution than gold; and on these gold fields the large consumption of cyanide is due to the presence of silver sulphide (principally Ag_2S) generally in amounts worth saving, and to the circumstance that the free gold is alloyed with about one-third its weight of silver.

According to Elsner's equation for the solution of gold by potassium cyanide, 4 pounds of cyanide should dissolve 100 ounces of gold; but in practise it is found that the operation takes nearly forty times that quantity. To dissolve 100 ounces of silver would require 7.5 pounds of cyanide according to the equation:

$$4Ag+8KCy+G_2+2H_2O=4(AgKCy_2)+4KHO.$$

From the solution of 100 ounces of silver existing as the subsulphide (Ag_2S), 7.01 pounds of cyanide would be required by the following equation:

$$Ag_2S+4KCy=2(AgKCy_2)+K_2S.$$

The potassium sulphide resulting from the dissolution of silver sulphide also tends to cause a loss of cyanide. It has been shown by Crosse and others that a trace of alkaline sulphide in cyanide solutions does not act injuriously; but the large quantity of K_2S liberated in the treatment of the silver-bearing ores of the Hauraki gold fields must cause the precipitation of a portion of the dissolved gold in the vats. Much of this precipitated gold is doubtless redissolved by the excess of free cyanide present in the solutions; but it always requires this excess to obtain adequate extractions, thus necessitating the use of comparatively strong solutions.

The cyanide process was first introduced in 1899 at the Crown mines at Karangahake, a property owned by a Glasgow company which had entered into a contract with the patentees, Messrs. MacArthur and Forrest, to treat the ore. This was the first actual application of the process at the mine. For two or three years the work carried on was largely of an experimental character, and until 1894 the results were unimportant.

For the year ending March 31st last, 45.31% of the gold and silver raised in New Zealand, amounting to the value of £489,767, was produced by the cyanide process.

At the majority of mines cyanide treatment was adopted by the owners at the author's recommendation, but only after he had made a careful investigation of the constituents of the ore, and repeated trials on a working scale at the Government experimental works at the Thames. In other cases, the necessary experimental trials were made by the author's assistants at the mine. In no case was the process adopted until success had been assured, a precaution which doubtless has been a potent factor in promoting the popularity of cyanide treatment in this country.

The ores of Te Aroha and Monowai are generally very refractory, containing free-milling gold, mostly very fine, associated with sulphides of silver, iron, copper, zinc and often mercury. Many attempts have been made to treat them by cyanide, but without success, and, so far as our present knowledge goes, it is doubtful if they can ever be treated successfully in the raw state by that process.

For the treatment of cupiferous ores and concentrates from the Jubilee, Sylvia and Monowai mines, which could not be treated successfully by ordinary cyaniding, the author obtained good results by first subjecting the ores to a chloridizing roast, and then leaching out the copper chlorides with water. After an alkaline and water wash the gold and silver contents were extracted by cyanide by percolation. During the roasting the silver sulphides present were chloridized to the chloride which is easily dissolved by cyanide.

From a large parcel of Monowai ore, 92% of the gold and 85% of the silver were extracted, the com-

* Condensed from Transactions of American Institute of Mining Engineers.

position of the ore being determined by F. B. Allen, as follows:

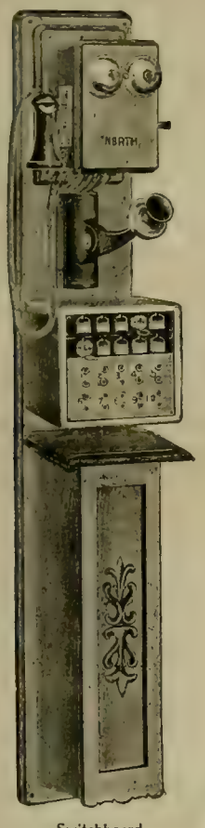
	Per cent.
Insoluble gangue	90.15
Copper pyrites	3.78
Iron pyrites	4.40
Galena	0.25
Zinc-blende	0.26
Alumina	0.13
Water and loss	1.03
	100.00

The bullion contents of this ore were gold 1 ounce 5 dwts. and silver 14 ounces per ton.

One of the most perplexing features connected with the treatment of these ores is the constantly varying proportion of silver, which necessitates the use of solutions of varying strength to obtain adequate extractions, thus adding another source of anxiety to the many worries which the use of cyanide entails on the successful cyanider.

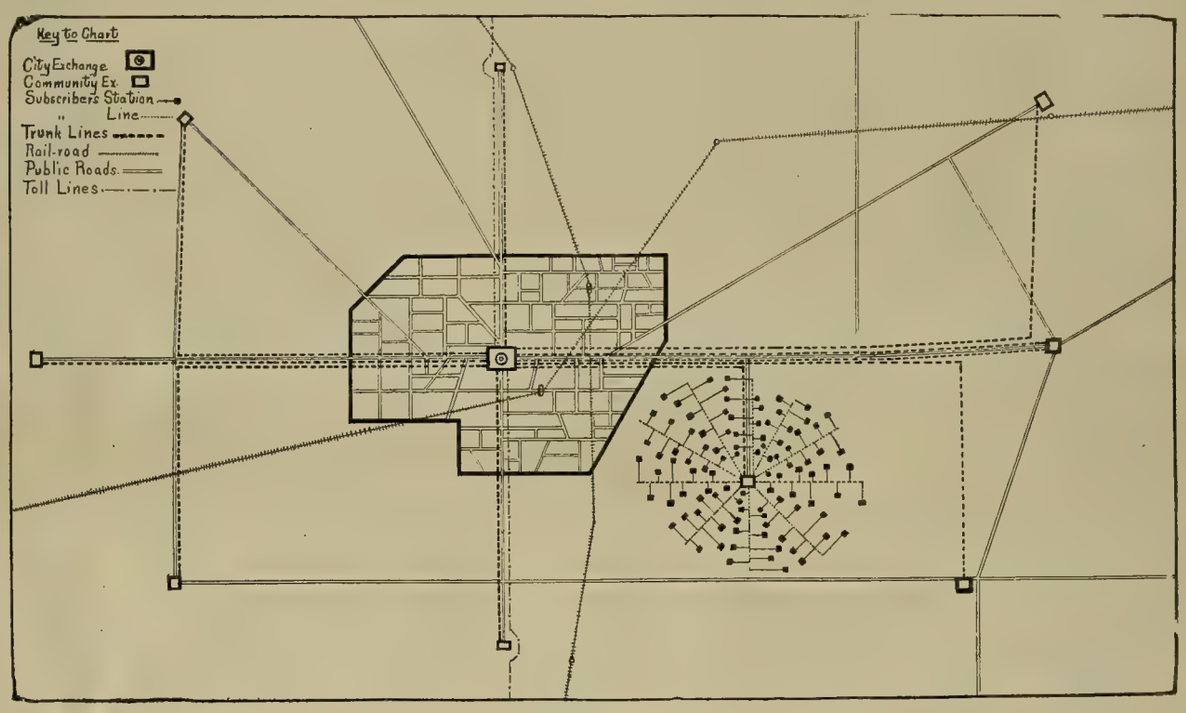
[The low stamp duty of the mills above referred to may be due to a tendency of the dense chalcedonic quartz to break into splintering fragments instead of grains. A narrow mortar would facilitate rather than retard discharge.—ED.]

Community Telephone Exchanges.



When the telephone was invented few people thought that the time would ever come when this necessity of modern civilization would be put within reach of all. Such, however, is now the case, the independent telephone companies having accomplished this desirable end. They formerly put the benefit of this convenience within the reach of the great middle class in towns and cities; now they have gone one better and are commencing to furnish service to small and scattered communities. Telephony can never reach its place in civilization until outlying residents are able to come into immediate verbal intercourse.

The North Electric Company, of Cleveland, Ohio, has recently brought out what it calls a "community exchange," by the use of which the city exchange is enabled to furnish a service at a price that is profitable to the exchange and, at the same time, within the reach of patrons in the country.



In the accompanying chart is shown a method which the North Company advocates, in placing community exchanges in the territory surrounding a city. At various points are located one of the switchboards illustrated herewith. From this central point radiate eight or ten lines, to each of which are connected several subscribers, preferably not over ten. This community exchange is connected by a trunk line to the city exchange, as are also the trunk lines from the several other community exchanges. Patrons are enabled to converse with any of the other subscribers to their own exchange, or, by trunking into the city exchange and from there to any of the other community exchanges, are enabled to reach any of the patrons of the city or other community exchanges. The subscriber can likewise connect to any of the toll lines that may run into the city exchange.

Each telephone is of the long-distance type, and one is enabled to talk to any point that the toll service reaches. The switchboard used at the community exchange is very simple and efficient and, it is stated, practically impossible to get out of order. A number of telephone exchanges have adopted this service with profit, and are now paying dividends where they formerly cleared but little money.

It will be noticed in the chart that the lines from the community exchange to the subscribers' stations are shown in connection with only one community exchange. If the reader will imagine the lines radiating from the other community exchanges shown, he will see that the territory is completely covered, and the patronage of the average exchange would often be more than doubled.

Switchboard.

Illustrating Method of Placing Community Exchanges.

Fineness and Value of California Gold.

The following is written by Frank A. Leach, Superintendent of the Mint at San Francisco, on the fineness of California gold and is from "California Mines and Minerals," the handsome and valuable book issued as a souvenir of the visit of the American Institute of Mining Engineers to San Francisco last September.

The following table is compiled from the average of fineness of deposits made from the various mining counties of the State, covering a period of several months, embracing both quartz and placer gold:

	Fineness.	Value.
Nevada	855	$17 67
Siskiyou	852	17 61
Kern	754	15 58
El Dorado	868	17 94
Placer	792	16 37
Tuolumne	804	16 62
San Diego	803	16 59
Shasta	845	17 46
San Bernardino	705	14 57
Inyo	770	15 91
Plumas	851	17 59
Calaveras	835	17 26
Tehama	882	18 33
Amador	836	17 28
Sierra	858	17 73
Mariposa	805	16 64
Trinity	850	17 57
Yuba	881	18 21
Los Angeles	889	16 81
Humboldt	688	14 22
Stanislaus	895	18 50
Butte	878	18 14
Fresno	805	16 64
Sacramento	898	18 56
Lassen	890	18 39
Mono	550	11 36
Merced	813	16 80
Madera	847	17 50

The above table credits Sacramento and Stanislaus counties with producing gold of the highest fineness. The majority of deposits from these counties, in fact, over four-fifths of the gold brought to the Mint from these locations, runs over 900 fine. This gold is almost entirely from placer sources. It is but fair to say that the average for Mono county was derived from a small number of deposits, and that an average covering a longer period might raise the fineness quoted.

The highest grade of gold received at the Mint for several years was from San Bernardino county, in a deposit of placer gold. It returned a fineness of 980, or a value of $20.25 per ounce. Tuolumne county has the record of yielding even a higher grade of precious metal than this from San Bernardino. It came from a quartz mine, now said to be idle, which produced gold almost pure, running at times over 990. It is worthy of note that, while the mines in the same locality usually have about the same average fineness of gold, there is sometimes a great variation; and often in one mine the gold will vary in value to the extent of a dollar an ounce in some cases. There were thirty-one counties which produced gold in California in 1898. In the first table in this article twenty-eight counties are named. Making an average of the fineness and value of gold from the counties named in the table, it is seen that the average fineness of California gold is 817.8 and the average value about $16.90 per ounce. The highest average county is Sacramento, where the gold averages 898, or $18.56 per ounce. Mono has the lowest average gold, 550 fine, or $11.36 per ounce.

The finest grade of gold produced in California, and probably in the world, is from the San Guiseppe mine, half a mile from Sonora, Tuolumne county. It is a quartz mine, but the gold has uniformly run from 982, or $20.29, to 987, or $20.40, per ounce. Some years ago the gold from a run of ninety tons of ore went 998, or $20.6305 per ounce. When it is remembered that perfectly fine gold is valued at $20.67 it will be seen how very pure this San Guiseppe gold is. No mine in the world has such a record, the only approach to it being the Mount Morgan, in Queensland. The Neal mine, near the San Guiseppe, has gold running 950½, or $19.65 per ounce, and it is also a quartz mine. The Table Mountain and Bald Mountain placers, of Tuolumne county have yielded gold running 950, or $19.63 per ounce. The Spanish Hill placer, of El Dorado county, has yielded gold 987 fine, or $20.40 per ounce. Some of the gold from the placers of Newhall, Los Angeles county, is worth $19.75, or 955½ fine. Placer gold is usually of higher grade than that from quartz. The highest average of fineness in California is that of the gold from the placers around Folsom, Sacramento county, where it is worth over $20 per ounce, running from 974, or $20.13, to 978, or $20.21, per ounce. The average fineness of gold from that county last year was 898, or $18.56 per ounce, the highest in the State. Gold of the lowest grade in the State comes from Mono county, where, at Bodie, it seldom goes over 580½, or $12 per ounce, and down to 411½, or $8.50 per ounce. The gold from the largest producing quartz mine at Bodie, in large quantity, averaged last year 484 fine, or $10 per ounce. Gold from some of the cyanide tailings plant in that camp ran only 130.5 fine, or $2.69 per ounce. At Benton, in the same county, the gold runs up to 919½, or $19 per ounce, but elsewhere it is of low grade. Average for the county is 550 fine, or $11.36 per ounce. There is so much variation in localities that a county average does not tell the exact story. For example, in Calaveras county gold for some mines at Angels runs 975, or $20.15 per ounce, and from Vallecito 987, or $20.42 (Fine Gold mine); while one mine at Hodson yields gold of 627 fineness, or $12.96 an ounce. There

is a mine in Inyo county yielding gold worth $20 per ounce, or 967½ fine, and one in Kern county with same grade of gold. The largest producer in the latter county has gold worth $16 per ounce, or 774 fine. A placer mine in Johnsville, Plumas county, also has gold worth $20.36, or 985 fine.

The following table of value of gold per ounce from Calaveras county mines was compiled from returns sent in to the Statistician of the Mint, for 1898. Q means quartz mine; H, hydraulic; P, placer; D, drift. Only a few of the mines of the county are named:

	Mine and Location.	Fineness.	Value.
Q	Demarest, Angels	798½	$16 50
Q	San Justo (Gates) Angels	960–975	19 84-20 15
Q	Hog Pen, Angels	880	18 19
Q	Lightner, Angels	885½	18 30
Q	Midland, Angels	830	17 57
Q	Gwin, Gwinnine	802	16 57
Q	Royal Cons., Hodson	627	12 96
P	California, Milton	863	18 25
Q	Easy Bird, Mok. Hill	871	18 00
H	Green Mount., Mok. Hill	919½	19 00
H	J. Cuneo, Mt. Ranch	897½	18 55
Q	Legal Tender, Murphys	880	18 19
Q	Hinsdorf, Murphys	756	15 62
D	Hedrick, San Andreas	871	18 00
H	Fine Gold, Vallecito	940–897	19 43-20 40
Q	Keltz, West Point	750	15 50
Q	Oakland, West Point	714	14 75

It will be noted that the value of gold per ounce produced in Calaveras county ranges from $20.40, which comes from Vallecito, to $12.96, which comes from the Royal Con., at Hodson. Silver, copper and lead are the metals most frequently intermixed with gold and tend to reduce its value.

Industrial Notes.

—All the Great Northern Railway employes talk strike.

—About 400 men are at work on the Everett, Wash., tunnel.

—The Seattle, Washington, manufacturers organized last week.

—A hundred bills before Congress propose to obliterate "the trusts."

—The employer's dollar grows smaller and the employe's dollar larger.

—Seattle, Wash., wants $1,000,000 Congressional appropriation for a government building.

—The War Department will send 400 soldiers to Alaska early next spring for service in the Cape Nome district.

—Prospectors for oil at Arroyo Grande, Cal., recently struck a flow of natural gas, which, when lighted, blazed up to a height of 12 feet.

—Near San Luis Obispo, Cal., along the line of the Southern Pacific coast line, about 2000 workmen are engaged in railroad work.

—Western newspapers are asked to unite in an effort to have Congress smash the paper trust by putting wood pulp and printing paper on the free list.

—Prince Poniatowski has bought the San Mateo, Cal., electric light plant and will operate it until the power transmission line from the Blue Lakes is completed.

—The assessed valuation of property in Oregon for 1899 is $120,287,879. This is the lowest total since 1890. The decrease since 1893, the year of highest valuations, has been $47,801,026.

—C. A. Canfield will build a machine shop, to cost $20,000, in Bakersfield, Cal., to make and repair well-boring tools, the plant to include a 45-foot lathe that will turn out the stems used.

—The Yuba, Cal., Electric Power Co. will build a transforming station at Lincoln to reduce the voltage through the main line from Colgate to Sacramento, from 24,000 to 2000 volts, for the proper use of incandescent lights.

—At Denver, Colo., the foundry and machine shops of the F. M. Davis Iron Works Co. were totally destroyed by fire on the 10th inst., loss $130,000, fully insured. Mr. F. M. Davis says they will immediately rebuild.

—Manufacturers in the United States, whose attention has been called to Mexico as a country where manufacturing can be conducted economically, with a view of supplying the population there with their products, have arranged with a Mexican company for the establishment of power houses, with 7500 H. P. at the Rio Blanco, in the State of Vera Cruz.

—At Springfield, Ohio, electric workers have gained an increase of wages from $2.50 and $2.75 per day to $3 per day, and the coal handlers from $9 per week to $10 for single and $11 for double teams per week.

—The hammer of the axle forge installed in the Santa Fe shops at San Bernardino, Cal., has a face of 11x22 inches, a 42-inch stroke, weighs 4200 pounds, and can strike a blow with a force exceeding 100 tons.

—The Senate Committee on Interoceanic Canals has agreed unanimously to report a bill for the construction of the Nicaraguan canal. The bill is the same as that reported favorably in the House by the Committee on Interstate and Foreign Commerce, with a few verbal amendments.

—The value of the manufactured goods produced in Denver, Colo., during '99 exclusive of smelter products, was $34,634,342. The factories employ 12,955 persons, whose earnings were $7,935,750. During '89 the Denver factories produced goods valued at $29,268,250, and employed 11,576 persons, who earned $7,110,450 in wages. In addition the smelters employ 1800 men, whose earnings during the year were $960,000.

—According to the last census the wealth of the United States in 1890 was $65,037,091,197, of which real estate and improvements figured at $39,544,544,333; mines and quarries, $1,291,291,579; gold and silver, 1,158,774,948; mills, machinery and stock on hand, $3,058,593,441; railroads, streets and steam, $8,685,407,323; telegraph, telephone, shipping and canals, $701,755,712; miscellaneous, personal estate, etc., $7,893,701,821. The increase of wealth from 1880 to 1890 was 49%. A proportionate increase from 1890 to 1900 would make the wealth of the United States today about $100,000,000,000. At the same rate of increase the wealth of the United States in 1950 should be about $608,475,000,000.

—The United States has 184,532 miles of railroad, Germany 29,984. France 25,862, European Russia 25,357, Great Britain 23,534, British India 21,543. The United States has 36,746 locomotives, Great Britain 19,602, Germany 16,842, France 10,502, Russia 8748, British India 4258. Great Britain has more locomotives per mile than any other country, owing to the congestion of her population. She also has more passenger cars, for the same reason, because her coaches have from 30% to 50% less capacity than those of the United States. Her passenger cars number 62,592, while those of Germany number 34,250, and those of the United States 33,893. As for passengers, Great Britain's yearly record is 1,062,911,000, while that of the United States is 698,342,000, Germany's 646,431,000, France's 382,240,000, British India 160,000,000, Russia 97,000,000. The average journey in the United States is much longer than that of the European countries, notably than that of Great Britain, where the large number of passengers is due greatly to the enormous suburban service in and about London. In freight here are the best yearly records: United States, 913,000,000 tons; Great Britain, 437,000,000; Germany, 276,000,000; France, 120,000,000; Russia, 97,000,000; British India, 39,000,000.

Personal.

LOUIS JANIN is in Butte, Montana.

B. S. REVETT, of Breckenridge, Colo., is in Boston.

C. S. CORNING says that a smelter will be built at The Needles, Cal.

PERCY WILLIAMS is now assayer at the Geyser mine, Mercur, Utah.

A. H. BUCK of Denver is now engineer of the Mapini mine, Durango, Mex.

VICTOR M. CLEMENT goes to London, there to make his permanent residence.

C. H. MALLETT has been re-elected Supt. Brunswick Con. M. Co., Nevada Co., Cal.

ASSAYER KRELIUS has resigned his position with Luckhardt & Co., San Francisco.

S. I. HALLETT has returned to Aspen, Colo., from a trip through Idaho, Nevada and Utah.

S. E. HOGE, of Los Angeles, Cal., is superintending his copper properties at Ogc, Colo.

F. W. KROGH, Pres. Krogh Mfg. Co. of San Francisco, has returned from Mariposa Co., Cal.

A. C. LUCK, Mgr. Austin M. Co., Austin, Nev., is examining mines in Grass Valley district, Cal.

W. H. NUTTING is at Bingham, Utah, superintending the erection of a smelter for the Bingham Gold & Copper Smelting Co.

ARTHUR W. CORRY, Supt. A. & N. E. C. M. Co., Kingman, Arizona, is visiting Butte, Montana.

F. B. HOWER, of Buffalo, N. Y., is in Victor, Colo., figuring on building a mill in Colorado City.

M. M. BARUH has assumed charge of the sulphur mine at Humboldt, Nevada. J. B. Miller is foreman.

WM. LEWIS WEBB has recently been appointed assayer for the Keystone Con. mine, Amador City, Cal.

J. B. CORBUS, Supt. Alaska-Treadwell mine, Douglas Island, Alaska, will remain in San Francisco till March 20.

A. C. GARDE has been appointed mechanical engineer of the War Eagle and Centre Star, B. C., Companies.

W. PELLEW HARVEY, of Vancouver and Victoria, B. C., is in London, and returns to British Columbia next April.

H. L. SHIPPY, Sec. John A. Roebling's Sons Co., has returned to New York City after an extended trip through Europe.

O. O. HOWARD, JR., Pres. Ratcliff Con. G. Mines, Ltd., operating in Inyo county, Cal., has returned from New York City.

G. F. WASSON is on the Colorado Springs, Colo., Board of Brokers' Association as caller, at a salary of $4500 a year.

THE Board of Regents Nevada State University has accepted the resignation of R. D. Jackson, who occupied the chair of mines.

A. PAYNTON has been appointed Commissioner of Crown Lands and Minister for Mines in the new South Australian ministry.

R. H. POSTLETHWAITE, of Oroville, Cal., dredging fame, has gone to British Columbia to report on a Fraser river mining property.

DR. STEPHEN BOWERS, California State Mine Examiner, preached an eloquent sermon in a Randsburg, Cal., pulpit on the 14th inst.

E. H. BENJAMIN, Sec. California State Mining Association, now on a business trip to southwestern Alaska, expects to return to San Francisco about Feb. 1st.

HENRY SHEEHY of Nevada is in San Francisco, en route to Bolivia, South America, there to take charge of a mining property for an English syndicate.

G. W. CARMACK, Pres. Carmack G. & C. M. Co., Index, Wash., is in San Francisco, deciding whether he will put in a smelter or concentrator at his property.

CHARLES H. SHERMAN of California has been nominated by the President to be assayer of the mint at San Francisco, to succeed the present incumbent, Assayer Elias.

PROF. WM. P. BLAKE, director of the School of Mines, has been appointed agent of the U. S. Mint for the collection of statistics of the precious metal production in Arizona.

E. J. LANDER of Sonora, Cal., who was instrumental in opening the Seminole, Star, Jumper, Norwegian and Greene mines, and who is now interested in several mining propositions there, is in San Francisco.

W. A. FERGUSON, until recently of the Westinghouse Electric Manufacturing Co., who has been installing electric plants at the Santa Ysabel and Harvard mines, Tuolumne county, Cal., has gone to the Moctezuma Copper Co., Nacosari, Sonora, Mexico.

NIKOLA TESLA says he will remove his laboratory from New York City to Colorado Springs, Colo., and there make his permanent residence. This time he "has perfected a machine by which he can transmit power several thousand miles without wires." N. T. is a good thing for the "science" supplements of the Sunday papers.

PROF. ELIHU THOMSON of Lynn, Mass., sends word (according to a doubtful press dispatch) from the City of Mexico that he has there pending, ready to issue, a patent on a "sun furnace," which, he says, is adaptable to smelting ores and generates heat more intense than the electric furnace. It is possible some one has been taking the professor's name in vain.

W. C. RALSTON, Pres. California State Miners' Association, has returned to San Francisco from an extended business sojourn on the Atlantic coast. While there he found time to do some effective work in awakening Eastern mining interests to the necessity of a Cabinet Secretaryship of Mines and Mining, and interviewed coast Congressmen regarding the feasibility of passing the California Mineral Lands bill.

Obituary.

THOMAS EGLESTON, who planned and founded the School of Mines of Columbia University, in which he was a professor of mineralogy and metallurgy, and who was prominent as an author of scientific works in this country and Europe, died on the 16th at his home in New York City, aged 68 years. Prof. Egleston was one of the founders of the American Institute of Mining Engineers, was its vice-president three times and was elected to the presidency in '86.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR WEEK ENDING JANUARY 9, 1900.

641,180.—SWIMMING APPARATUS—J. S. Bartholomew, Guerneville, Cal.
610,864.—NECKTIE FASTENER—J. W. Blundon, S. F.
610,865.—PILE DRIVER—J. W. Blundon, S. F.
641,185.—VALVE—C. A. Borein, Oakland, Cal.
640,875.—ADVERTISING DEVICE—E. Cherry, S. F.
641,192.—STEERING MECHANISM—J. Christensen, S. F.
640,768.—BUCKET DREDGER—J. H. Gray, S. F.
640,902.—GANG EDGER—D. B. Hanson, Seattle, Wash.
641,010.—HEMP BRAKE—J. Heaney, Gridley, Cal.
641,206.—FLOORING—S. Hedges, Los Angeles, Cal.
641,143.—WINDMILL—J. O'Toole, S. F.
640,933.—LUNCH BOX—A. J. Osborne, Pomona, Cal.
641,145.—SAFETY HOIST—T. H. Oxnam, Los Angeles, Cal.
640,940.—CATTLE GUARD—W. T. Payne, Tacoma, Wash.
641,229.—PUMP—A. L. Reynolds, Santa Ana, Cal.
640,947.—HOT AIR SYRINGE—J. L. Richards, S. F.
640,949.—AIR COMPRESSOR—E. A. Rix, S. F.
641,233.—WAVE MOTOR—C. F. A. Roell, Los Angeles, Cal.
641,239.—CANDLE HOLDER—H. Schroeder, Spokane, Wash.
641,242.—WINDOW SCREEN—R. M. Spencer, S. F.
640,971.—GOVERNOR—A. C. Stewart, Santa Paula, Cal.
640,849.—NUT LOCK—L. Wade, Escalon, Cal.
640,980.—ANIMAL TRAP—C. M. Williams, Los Angeles, Cal.
641,251.—WATER LIFTER—L. H. Woolley, Oakland, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

STEERING MECHANISM FOR VESSELS.—J. Christensen, San Francisco, Cal. No. 641,192. Dated Jan. 9, 1900. The object of this invention is to provide an improvement in that class of apparatus which is designed to steer vessels by other than manual power, and in conjunction therewith he employs a liquid brake or check mechanism. The invention consists of a cylinder having a piston movable therein, a piston rod extending through both ends of the cylinder, means for supplying a fluid pressure upon either side of the piston whereby it may be moved within the cylinder, tiller ropes or chains connecting with opposite ends of said piston rod leading to the tiller of the rudder and balance cylinders interposed between the power cylinders and the rudder.

SAFETY ATTACHMENT FOR HOISTING HATCHWAY.—T. H. Oxman, Los Angeles, Cal. No. 641,145. Dated Jan. 9, 1900. The object of this invention is to prevent dangerous and fatal accidents which occur in operating hoisting machinery by reason of the cage being carried up beyond its proper stopping place and into contact with the sheaves or other part whereby breakages are caused. This device consists of a wheel journaled in the shaft at right angles to the path of movement of the cage having a peripheral stop disposed in the path of the cage, a motor having a valve controlling the hoisting mechanism, and a rod or connection having one portion attached to the valve and another portion eccentrically and directly connected with the wheel so that the axial movement of the latter imparts an endwise pushing movement to the rod or connection, thus closes the valve or throws the motor out of action before the cage has reached the danger point.

MINING SUMMARY.

ALASKA.

L. F. Shaw of Seattle, secretary Miners' Association of Alaska, says: There will be many miners coming north, largely made up of practical placer and quartz miners, who will bring with them many years of mining experience, as well as sufficient nerve to protect the side of justice and fair dealing in the disposition of mining claims, and I trust will carry these principles into Alaska. The methods evolved in that region last year concerning locations are wrong in principle and absolutely repugnant to the American idea, and the Association should be able to enlist a sufficient force, from the large numbers going into Alaska, to settle at once, and for all time, the unholy practises performed there, showing these land grabbers that an equitable division of mineral ground must and shall be respected. A few men, well organized, in a mining camp are all that is needed to correct these abuses; a few good leaders of sufficient courage to step to the front and call for a showing of hands. A nucleus thus formed will have the moral support of all right-minded men, which within itself is irresistible, and so the reign of the usurer will give way to better things.

The Cape Nome Electric Light & Telephone Co. has incorporated in San Francisco to install at Nome a telephone system and an electric light and power plant.

Several expeditions are fitting out in San Francisco for Cape Nome.

Roos Bros. have chartered a small steamer and next March will depart with fifty men and enough provisions for two years. L. Harden, of Winnemucca, Nev., will, with a party of sixty men, take a vessel starting march 10. They intend taking their own provisions and a physician.

ARIZONA.

COCHISE COUNTY.

The Oregon mine is attracting attention. It has come into the possession of the Dos Cabezas Con. Copper Co. The ledge is from 12 to 14 feet.

GRAHAM COUNTY.

The Detroit Copper M. Co. proposes to build a railroad, the Morenci Southeastern, to Guthrie, on the Gila river, connecting with the Arizona and New Mexico railroad, nineteen miles long, narrow gauge.

The Detroit Copper Mining Co. at Morenci has done twenty miles of underground work during 1899, nearly five hundred miners being engaged. There is being built a large concentrating plant, capacity 500 tons per day, to treat ore valued at 60 cents per ton. There have been put in place six 125-horse power gasoline engines. The matte is converted by the pneumatic process. The output is 28 tons of ingot copper per day.

MARICOPA COUNTY.

Phœnix is to be supplied with electricity generated by water power 22 miles east of the city by the Arizona Water Co. The electricity is to be generated by 3-phase dynamos and will be transmitted to Phœnix at a voltage of 20,000 over aluminum wires. It is estimated that not over 6% will be lost in transmission. The line will be run by way of the Arizona canal falls, eight miles northeast of Phœnix.

PIMA COUNTY.

(Special Correspondence). — Tucson, which is a rival with Santa Fe, New Mexico and St. Augustine, Florida, as the oldest town inhabited by Europeans in America, is in many respects a remarkable old place. The first settlement is put down somewhere between 1555 and 1560 and is, therefore, approaching its three hundred and fiftieth year. It was an old fortified adobe town established by the Conquistadores when under the lead of Hernan Cortes. They came North in the pursuit of gold and silver, closely followed in their wake by Jesuits who established a few miles from here the San Xavier mission and endeavored to Christianize the wild Indian. In more recent years, before the advent of the Southern Pacific, it was known as the great central distributing point for hundreds of miles around here; goods being sent by wagon as far south as Guaymas in Sonora and even farther.

While still to some extent a Mexican town, there is a transformation slowly though surely going on. Wider streets, substantial sidewalks, three-story brick buildings and handsome residences are receding from the old Mexican quarter, leaving it a distinctive feature alone by itself. It is located on the Santa Cruz river in the northwestern part of Pima county and is its county seat. Its city limits are about two miles square, and its population is variously estimated at between 6,000 and 9,000. As a health resort it stands unsurpassed. The climate in winter being equable and while quite hot in summer sunstrokes are unheard of.

The School of Mines, under the administration of Professor Blake, is rapidly coming to the front as an educational institution. The town is soon to have a public library to which Mr. Andrew Carnegie, through the efforts of his old fellow townsman, R. W. Pittock of the "Star," has contributed the sum of twenty-five thousand dollars.

While Pima county has long been known as a mineral producer of gold, silver and copper, there are no producing mines of any consequence within a radius of twenty miles. Beyond this range, mineral is found everywhere in the mountains in greater or lesser quantities.

The property attracting the most attention at present is that of the Helvetia Copper Co., situated about thirty miles west of Tucson. It was located and held down under more or less unadventitious circumstances for some eighteen years, by an old miner named E. C. Hughes, who made occasional shipments from it, and an old furnace was erected near by in 1882, which treated some ore from time to time, which is now a ruin, and the slag dump from which is now being hauled back to the new smelter of the Helvetia Co., furnishing excellent fluxing material, as well as paying about 3% in copper.

About a year ago C. E. Udall, a young assayer from Denver, obtained a bond on the property and induced some gentlemen interested in and connected with the Calumet & Hecla copper mines of Lake Superior to look into the property, which resulted in a sale for the sum of $50,000.

The new company at once began in a business like manner, not only to open up the property, but to build a 150-ton smelter and a railway from the smelter to the top of the mountain, a distance of three or four miles. When the new company took hold, about the 1st of last May, there was one old "shack" and one tent on the property. Now there are several substantial adobe buildings, many frame buildings, and tents enough to furnish accommodations for a population somewhere between 800 and 1000. It is not a town in embroyo, but a town in fact.

The property comprises fifty-two claims, or about 1000 acres, and the ore, which is largely sulphide, carries from 8% to 20% copper. This is brought down to the smelter at a minimum of expense. Four hundred men are employed at regular Arizona wages, and if ever there was a contented and orderly community this is one.

The smelter has been running on black copper, with a loss in the slag of three-tenths of 1%. At the present writing it is shut down, owing to the lack of coke, which has to be hauled in wagons from Vial, a station on the Southern Pacific twenty-five miles away. The company has expended in development $150,000, in addition to the purchase price of the property. A fact worthy of remark is that the management of the company is entirely in the hands of young men, all but one of whom are from Lake Superior, and not one of whom seems to be over thirty-five years of age.

Right in the midst of the claims owned by the Helvetia Co. lies less than a whole claim known as the Mohawk, owned by the Lewisohns of New York, and which has produced over half a million dollars. The ore from this property is packed across the range on burros to Rosemont, four miles away, where there is a sixty-ton water-jacket furnace, at a cost of $3.50 per ton.

The Helvetia Co. is prospecting its property with a diamond drill, and its work was so satisfactory that it is worthy of remark here. They are running the drill two shifts of ten hours each with five men at a cost of $15 per day. On the two shifts they make from 20 to 30 feet per day in depth, and in soft ground more, at a cost of $1.50 per foot in addition. Ten barrels of water per day are necessary, and the cost of the drilling plant on the ground was about $4000. The drill here in use is good for a depth of 1200 feet. The manager of the company is so well pleased with its work that he is about to erect another.

The Azurite group is another copper property concerning which much has been written, and which has been reported recently sold. Your correspondent has reliable information that, while the papers have been executed, no money thus far has been paid. These mines were located by Howard Baynes in '88. In '98 the Azurite Copper & Gold M. Co. was organized by ex-Gov. L. C. Hughes, Gen. Thos. D. Sattewhite, Sherman M. Woodward, Thos. Hughes and Howard Baynes. They have over 4500 feet of development work on the property, together with a thirty-ton water-jacket furnace. The property is very highly spoken of by experienced miners who ought to know.

Tucson, Ariz., Jan. 12.

CALIFORNIA.

AMADOR COUNTY.

At the Kennedy mine a new station is being started in the north shaft at the 2300-foot level. The new vertical shaft now approaches 1000 feet in depth.

At the Mutual, near Sutter Creek, the new three-compartment shaft is down now 340 feet.

The Rhetta G. M. Co. has incorporated to mine in Amador county. Capital stock $300,000. The directors are John Ross, Jr., of Sutter Creek, G. Kratcher, J. L. Bryson, Plymouth, W. W. Worthing, H. Kaiser, W. B. Sampson, Stockton.

CALAVERAS COUNTY.

Stoping progresses in the Angels mine. J. V. Coleman intends putting a 40-stamp mill on the mine this year.

The Edna mine is reported sold to a Holland syndicate.

At the Gwin mine 170 men are at work, and eighty stamps in operation.

EL DORADO COUNTY.

Gazette: Prince & Willard, working the Cornucopia placer mine, on Rock Creek, made a shipment of three and a half pounds of gold last week. The gold goes $19.71 to the ounce. They use a self-shooter of 6000 inches capacity.

INYO COUNTY.

(Special Correspondence.)—At the Ratcliff mines the new compressor, built by the Compressed Air Machinery Co. of San Francisco, Cal., has been installed, and the first round of holes were put in on the 15th inst. The new 20-stamp mill is completed, and the tramway will be in operation by the 25th of this month. Development work is being actively prosecuted, and the ore bodies opened up have increased in size and are an exceedingly good grade of ore. In excavating for the ore bins at the upper terminal of the tramway, 148 feet vertically below tunnel No. 5, nearly 40 feet of ore was uncovered, assaying nearly $20 per ton. A tunnel has been started on this ore body, from which the cars will dump immediately into the tramway ore bins. Forty-five men are now employed at the mine.

Ballarat, Jan. 17.

KERN COUNTY.

The proposed Kern River Pipe Line & Storage Co. talks of a pipe line from McKittrick to Bakersfield, fifty miles, and the 4-inch piping alone would cost $150,000. Its effect would be to materially cheapen the delivery of oil from McKittrick into Bakersfield.

Work is to be resumed on the Little Butte mine at Randsburg.

LOS ANGELES COUNTY.

Mooney & Dunham will put a smelting plant on their copper mine, two miles below Acton.

NAPA COUNTY.

The following from Supt. Newcomb gives the production and shipment of quicksilver from the mines named during the year 1899: Napa Con., 5,850 flasks, Ætna Con., 3,800; Boston, 882. Total, 10,532 flasks.

NEVADA COUNTY.

The Union reports a rich strike in the Little Dublin mine on Little Deer creek, the ore assaying $18 to $36 per ton.

PLACER COUNTY.

Directors of the Pioneer Mining Co. say that the vein lost some months ago will be found. Forty miners are working in various parts of the property in search of the lost ore body. The mill was recently started up. A director says the company has $30,000 cash on hand.

Operations have begun again at Lynchburg, and good gravel, it is said, has been struck there.

Men are at work at the Basin Con. at Deadwood.

At the Crandall, where only five or six inches flowed out of the tunnel a year ago, fully 150 flow to-day.

Wm. Muir is working 25 men at the Weske.

Several of the Ophir mines are busy pumping water; the Three Star has not been troubled by an increase.

Herald: Work has been started again at the 140-foot level in the Bellevue shaft.

Colfax Sentinel: The new compressed air plant at the Red Point gravel mine, twelve miles above Forest Hill, is being installed. The engine is 15 feet in length and weighs 11,000 pounds. The compressor plant is located down the canyon 3500 feet from the mouth of the tunnel. Power is generated by using 40 inches of water that flows from the tunnel. The pipe line to the compressor gives a pressure of 656 feet, furnishing a minimum of 40 H. P. The company have purchased 10,000 feet of heavy pipe to convey compressed air to the charging stations. The main tunnel at Red Point is now in over 15,000 feet. The gravel was formerly dumped through a chute from an upper tunnel into cars in the lower tunnel at a point 2200 feet in. A start was made back 1800 feet from mouth of tunnel and 800 feet of new tunnel on a 3% grade connects the upper and lower tunnels. The Red Point mine is the first mine in Placer county to use compressed air for traction purposes. Seventy men are now employed at the mine. J. A. Ferguson is superintendent.

The Morning Star Mining Company have sold their telephone line from Iowa Hill to Colfax to the Sunset Company. A line has recently been put in between the mine at Iowa Hill and Sunny South.

PLUMAS COUNTY.

Supt. Farnum of the Four Hills mine has secured the services of five Comstockers to run drills in his mine.

SAN BENITO COUNTY.

The New Idria Q. mine, B. M. Newcomb, Supt., in '99 produced 4780 flasks.

SAN BERNARDINO COUNTY.

The copper mines at Copper City Camp, Morrow mining district, formerly belonging to the United Yucca and the Feejic mining companies, 38 claims, are bought by the Union Development Co. of Boston for $5,000,000; J. B. Neily of Boston president. J. I. Crowell has sunk a shaft 212 feet. He has also put down eight wells. From one of them, at a depth of 32 feet, there are daily pumped 3,000 gallons of water.

SAN DIEGO COUNTY.

Receiver Isaac Trumbo of the Golden Cross mines makes his third report, covering the month of November. The value of the clean-up for the month was $22,-959.25; receipts from other sources, $863.30. The payroll for the month amounted to $7200; fuel bill, $700. The litigation involving the mines on the desert will be carried to the Supreme Court again.

The sale of the Cincinnati Belle and Gold King mines, in the Banner district, to D. C. Collier, Jr., is reported, at $10,000.

SANTA CLARA COUNTY.

Twenty-one quicksilver mining locations have been filed at San Jose, each 1500 feet by 600, in the Uvas mining district, said to be on lands claimed by the Guadalupe Quicksilver Mining Co., which has recently made preparations for reopening the mines.

SIERRA COUNTY.

J. W. Finney is working the Sierra mine, near Downieville. More rain than in three years has fallen.

H. E. Averill, near Hawley Lake, is putting considerable improvement on the Four Hills mine, and anticipates a busy season.

SHASTA COUNTY.

During the late storm the dam at the National mine, holding tailings, gave way and the center of the mass was washed down the gulch. Half were lost. The portion swept away was the richest, being in the center, and consequently the deepest. Some of the richest went $8 a ton.

T. H. Oxnam, general manager for Capt. De Lamar at Bully Hill, near Redding, tells the Free Press that he thinks he will begin the erection of a smelting plant in the spring or early summer, and that an expert is expected from the East soon to take up the business of preparing for a smelter.

The Sacramento river is to be bridged at Keswick. The mines on the east side produce low-grade quartz which can be cheaply worked at the smelter. There are now three aerial tramways across the river conveying quartz.

Buick & Wengler have a contract from the Mountain Copper Co., Keswick, to deliver this year 10,000 cords of wood at $3 a cord.

SISKIYOU COUNTY.

Journal: The first payment of $10,000 on the bonded Dwinnell group of quartz ledges on Squaw creek, near Gazelle, was paid last Saturday, and the balance of the $125,000 will be paid at stated periods later on.

TRINITY COUNTY.

(Special Correspondence).—The Trinity river has been higher this winter than any time since 1882. Sluicing on the bars will be good this season. Where I worked off the gravel last year it has refilled, and there seems to be as much fine gold in the new deposit as there was in what I worked last year.

Bragdon, Cal., Jan. 12.

The Bloss & McClary mine at Trinity Center will now flume its tailings to the Trinity river

Some of the Coffee Creek mines have closed until April. The Golden Jubilee mine, under the management of J. C. Steele, is running steadily. The Altoona mine is also running.

TULARE COUNTY.

The Register and Receiver of the Land

Office at Visalia, in a hearing to determine the character of land upon protests filed by the mineral claimants against what is generally known as forest reserve lieu selections under the act of June 4, 1897, have decided that where valuable mining locations exist the burden of proof is on the agricultural claimant to prove the land is non-mineral in character; that where there are no valid mineral locations the burden is upon the mineral claimants. They hold that the seeps of petroleum or bitumen in rock in place is sufficient upon which to base a valid mineral location.

TUOLUMNE COUNTY.

(Special Correspondence).—In the chain of mines northwest and southeast of Carters, the strike and dip of the vein in each suggests that many of them are located upon the same lode. Beginning with the old Eureka mine, whose surface ground is now covered in part by the town limits of Carters, the first to the southeast is the Dead Horse, next the Lady Washington, now idle, with its tunnel running into the steep bank of the North Fork of the Tuolumne river; then the Richardson, an undeveloped location; next the Grizzly, on the east side of the river; then the Bonito and the Consuella. The Providence is thought by many to be on the same vein; others believe it is on a parallel vein. Beyond the Providence come the New Years, McKinley, etc. To the northwest of the Eureka lie the Cherokee, Laura, North Star, Carlotta, Pennsylvania, close to Carters; the Columbus, at Cherokee; the Uncle Sam, Laurel, Dreisam, Rising Sun and the Blue Lead at Arrastraville. This makes an interesting chain of mines, all of which have just been visited by your correspondent.

The Dead Horse, the oldest of the active properties, belongs to the Consolidated Eureka Gold Mining Co. The incline shaft is down 1550 feet. The mill is equipped with twenty stamps and eight concentrators, and there is a cyanide plant for the sulphurets. The motive power at the mill and hoist is water. Thirty-six men are employed. The labors of Superintendent Fred Corkhill at this mine are supplemented by the able counsels of Foreman Dennis Kane, who has recently been sent over from the Utica mine, in Calaveras county, where he held a similar position.

The Grizzly is two miles from Carters, on the steep east bank of the river. The tailings from a 20-stamp mill are flumed several hundred feet to the concentrator building, near the bed of the stream. This arrangement scatters the plant, but it seems unavoidable on account of the precipitous formation of the river bank. Water under both high and low pressure is used for power, the latter being supplementary to the former. In the first instance the water is bought from the New Albany Company, which owns a ditch along the river bank; in the latter instance the Grizzly gets free water from the river a short distance above the concentrator plant and flumes it to a turbine wheel opposite the mill, where a wire cable transmits the power to the works at the mine. At present there is a lull in the work of drifting and stoping at the Grizzly, and the mill is idle. The largest force of miners practicable is engaged in sinking below the 700-foot level, and as soon as an 800-foot station is established, an increased force will be put on, and the mill will be started. W. R. Hall is superintendent at the Grizzly.

The Barry mine joins the Grizzly on the east, it being a parallel location, and a promising one. Three tunnels at different levels have been run in on the vein; the one now being driven will give 700 feet of backs. Assays show that the ore runs as high as $78.20 per ton in free gold, with sulphurets worth $1100 per ton. Average assay value, $21.19 per ton of ore. There are three veins in the location, the one developed being in slate and granite, with a width of 3½ feet.

The Carlotta and Pennsylvania mines are the property of the Carlotta Mining Co. of San Francisco, a corporation composed largely of S. P. Railroad people. There is a steam hoist at each mine, with a seven-stamp mill (one five and one two-stamp battery) at the Carlotta. The mines are idle at present, having been closed down last August after an unfortunate experience by the lessee, D. Neagle. It is thought locally that proper management would render these mines profitable. The shaft in the Carlotta is down 220 feet; in the Pennsylvania, 200 feet.

Salt Lake parties have a bond on the Laura and North Star mines. Development work goes on under the superintendency of W. C. Oakes, who has had many years experience in California, Idaho and Montana mines. The work is being conducted from the shaft at the Laura, where 400 feet in depth has been attained. From here a drift is being run northwest to strike the old North Star vein, which yielded excellent ore thirty years ago, under the ownership of Lombardo, an feet, and from surveys made it is thought the vein will be encountered within the next 75 feet. The Laura contains an undeveloped shoot of ore, which can be worked in case the North Star vein does not come up to expectations. There is a separate steam hoist and 10-stamp mill at each mine, all being the property of the North Star M. Co.

At the Uncle Sam mine, Arrastraville, it is the intention to continue sinking from the present lowest level—200 feet—to the 400-foot level, when a crosscut will be run to tap the vein. There is now a crosscut tapping the vein 173 feet. The plant here is small, but modern and effective. E. G. Dell is Supt. The parties having the mine under bond are business men of San Francisco.

The shipshape, clean and modern appearance of everything at the Dreisam mine is what first impresses the visitor. Besides the hoist there is a mill containing two 2-stamp batteries, two concentrators, etc. Water is the motive power employed, but a steam outfit is held in reserve. The shaft is down 230 feet, where a crosscut is being run for the Ophir vein, which it is expected will be tapped within 80 feet. There are three veins in the location, from one or the other of which plenty of good ore is now being taken to keep the mill going. As the three veins pitch toward each other at varying angles, the owners think they will have a rich ledge below the point of intersection. An electric light plant for the mine is about to be installed. Wm. Moorehead is Supt. The owners are the same as those in the Dutch mine, at Quartz Mountain, Gus Trittenbach being president of the company.

At the Laurel, Supt. J. W. Richards is sinking on the ledge, which he states has widened to nearly 3 feet and shows continued improvement. The plant consists of a steam hoist only. A considerable quantity of good ore is stacked up, waiting the day when a mill may be installed.

At the Rising Sun, Arrastraville, sinking is being done on the vein from the 185-foot level in the tunnel. It is proposed to ascertain the extent of the ore shoot. Ninety tons of ore were milled last summer which yielded $1150. The prospects here are excellent. J. L. Tonkin is Supt.

Your correspondent found work at the Confidence mine in full swing. This is one of the largest active properties north of Sonora, and gives employment to fifty or sixty men. The main shaft is down 800 feet, and a high grade of free-milling ore is fed to the twenty stamps in the mill. The elevation at the Confidence is 4000 feet above sea level. Neil Carmichael is Supt.

Your correspondent met at Sonora J. W. Brown, M. E., Supt. of the Temescal M. Co.'s properties, above Confidence. Mr. Brown declares that he is now, for the first time in his life, in a position where he has "too much mine for his mill." As he controls eight or ten claims and has only a 5-stamp mill run by a hurdy-gurdy wheel, this situation is easy of comprehension. His company should increase his mill equipment. He has been running ore worth $38 per ton. The owners of the Temescal properties are the same as those in the Champion and allied mines of Nevada county.

The Black Oak mine, near Soulsbyville, was described at length in the MINING AND SCIENTIFIC PRESS about one year ago. There are thirty stamps in the thoroughly equipped mill; a short distance below is one of the largest cyanide plants in the State. The concentrated tailings from the mill are treated by the cyanide process, and not the sulphurets. The latter, as well as a considerable percentage of assorted ore, are sent to the Selby Smelting Works. The ore sorting is done by Chinamen, who are said to be expert at this work. Two-fifths of the value of the ore is caught in the batteries and on the plates. Seventy men are employed. W. P. Scott, one of the owners, is superintendent: his brother, W. G. Scott, also joint owner, is foreman of the mine.

Work on the Draper mine, near the Black Oak, has been temporarily suspended on account of an unusual flow of water, which will be speedily got rid of. L. H. Bartlett of Boston, Pres. of the company, is in charge. The Draper has been a big producer in the past.

C. E. Condy and L. Leonardini, owners of the Mary mine, near Arrastraville, whose 2-stamp mill was destroyed by fire in November last, will rebuild in the spring.

The Hazel mine, in the Keltz mining district, started its new mill on the 1st. It contains two (1000-lb) 2-stamp triple discharge batteries, two concentrators and steam air compressors. It can reduce about twelve tons of ore per day. The ore is heavily sulphuretted, and the gold carries a percentage of tellurium. The mine Italian count. The drift is now in 1100 is opened by a tunnel 500 feet long, tapping the vein at a point 200 feet vertical. Drifts run out 125 feet in each direction from the tunnel. The vein now being worked is from 2 to 4 feet wide. There are four parallel veins belonging to the Hazel Company, three of which have been cut by the tunnel. The mill is run with free water, under 300-foot fall, taken from Five Mile creek. If this supply fails, recourse may be had to the Tuolumne Water Company's big ditch, which runs above the mine. W. B. Moore is superintendent of the Hazel mine; the owners are San Francisco capitalists and business men.

The work of building a 60-stamp mill for the Harvard mine, near Jamestown, is now progressing rapidly, and the structure is about ready for its equipment. The stamps will be placed upon a foundation of wooden pillars, solidly bedded in concrete and packed gravel. An electric plant is being installed to run the mill, air compressors and blowers, power to be supplied by the Tuolumne Water & Power Co. There are two hoists, both run by steam. Shaft No. 2 is down 750 feet, and is connected by a drift with No. 1. It is expected that the Harvard will employ 100 men when in full operation.

The bonding of the Genoa, an old and idle property on the outskirts of Sonora, is looked upon as an important item at the Tuolumne county seat. The Genoa produced much gold from surface workings many years ago, and showed good ore in tunnels run into the vein from the hillside. It was known as the Golden Gate Extension. It is the intention of the new company to go into the old tunnel, run an upraise to the surface, put in a hoist and follow the hanging wall down. By piping water 600 feet an enormous pressure can be obtained to run air compressors or other machinery. Messrs. J. A. Gleason and P. M. Keefe have a bond on the Genoa.

A mining enterprise which is attracting more than ordinary attention in Tuolumne county is that of the Carters G. M. Co., who are about to develop the Spring Gulch and Canyon mines, several miles southwest of Carters. The mine was bonded a few months ago by Messrs. Willet & Eggert for $30,000. The old Spring Gulch vein was a great producer in early days, and was of unusual width and well defined. In the working of the vein the miners came upon a fault—the ledge broke off abruptly and for a time was lost. Future development has located the lost vein. It is now proposed to develop the property by running a tunnel into the vein from the side of the gulch. At the mouth of the proposed tunnel there is almost unlimited free water power, and it is calculated that the Spring Gulch ledge will be tapped within 1000 feet, thus giving from 1000 to 1200 feet of backs on the dip of the vein. It is also expected that the tunnel will cut at a considerable depth another well-defined vein which crops out at the surface. Both veins will be worthy of development. Sufficient ore to keep a mill at work can be taken out of existing tunnels tapping the Spring Gulch vein, and it is proposed to erect a mill the coming spring. Many consider this one of the most inviting propositions in the county.

Jamestown, Jan. 14.

(Special Correspondence).—At the Arbona mine drifting progresses on the 300 and 400 foot levels. The shaft is down 533 feet, showing good milling ore.

Tuttletown, Jan. 16.

T. J. Russell, Supt. Shawmut mine, near Chinese Camp, contemplates putting in a reduction plant at his mine.

The mill at the Arbona mine is running constantly.——G. Blake has closed the O. K. mine temporarily, preparatory to putting up new machinery. ——At the Gagnere property R. Long, Supt., the three-compartment shaft is being sunk from the 180 to 500 feet.—— G. F. Dyer, Supt. Draper mine, is East, where he will arrange for starting work on the tunnel at the Horse Shoe Bend quartz mine, on the Stanislaus river.

COLORADO.

CHAFFEE COUNTY.

(Special Correspondence).—New plants of machinery are on the Anaconda, Gold Bug, Veivendeer and Queen City properties. The Queen City has a shaft 60 feet deep deep and 4 feet of ore that averages $42 per ton.

Turret, Jan. 11.

In the Turret district, only two years old, are four plants of machinery, and three more will be put in early this year. The formation is granite, with porphyry and phonolite dykes cutting the formation; the veins parallel these dykes. The altitude is about 900 feet. The payroll is now over $6500 per month.

GILPIN COUNTY.

About 100 men have been laid off on the Cook mine, Central City. Mgr. Colvin says he had word to stop all operations from the Boston owners, on account of the injunction restraining the company from working on the west side of the shaft. This injunction is in a suit brought by the Big Hatchet M. Co., operating the Washington claim, west of the Cook shaft, and who claim that the Cook people are working on their Washington vein. The Cook M. Co. has been giving employment to over 100 men. Its payroll has been from $8000 to $10,000 per month, and its expense account $5000 for the same length of time.

Carpenters are at work on the framework of the new mill at Black Hawk.

At the California mine the foundation for the large hoisting plant is completed. Mr. Hannigan has men at work on the shaft building.

LAKE COUNTY.

According to the Denver Post, the bulk of Leadville's zinc product, which is quite large, is now going to the great smelting works at Vielle Montague, a strip of neutral territory between France and Germany, where zinc has been mined ever since the year 1400, and is the largest producer of that metal in Europe. The smelters there draw their supplies from all the world, and, if Leadville can furnish 20,000 tons of the right kind of material, these ancient works will take all of it. This would add $800,000 a year to the product of the district.

Chronicle: Co-operative mining on a large scale is the feature of the operations of the Maid and Henrietta. There are sixty-five men at the two shafts, with no bosses and no book-keeper. Every man is his own shipping clerk and does his own caging. There is no confusion whatever, and the men have little trouble in the management of their affairs. The ground is leased by the owners to the Maid of Erin silver mines lease, of which Lincoln Raynolds is Mgr., and this company in turn divides it up among a great number of tributers, the settlements for the ore being made by the Maid Leasing Co. The engineer is in the employ of the company, and, by mutual consent of the various companies of lessees, he decides how long each lessee shall use the cage. Each man underground comes in for his turn to hoist every so often during the day. The mining at the Maid and Henrietta is probably the cheapest in the camp. All superfluous help is done away with. Time keepers, foremen, clerks of all kinds, as well as superintendents and managers, do not have to be paid, and the result is that the expenses, being reduced to a minimum, the very lowest grade ore in the camp can be mined.

SAGUACHE COUNTY.

Tellurides are reported in the Little Alec mine on Star mountain; porphyry, trachyte and andesite are the eruptive rocks that cut up or overflow the metamorphosed granites. Such geological formations are favorable to the gold fissures of depth and continuity.

SAN MIGUEL COUNTY.

The Pittsburg company which has been experimenting with the ore of the Klondike mine, at Ophir, to determine the best process for its treatment, has decided to adopt a combination of amalgamation and cyanide, and will construct a 100-ton plant equipped with stamps and amalgamating plates. From the plates the entire product of the batteries will go to the cyanide tanks.

The new cyanide tank of the Gold Recovery Co. at Telluride has begun treating ore.

SAN JUAN COUNTY.

Dr. Pascoe, who is working for a smelter at Silverton, tells the Standard that the low grade ores of San Juan county cannot be treated at a profit by chemical processes that have proved profitable in other camps, and that there is not a single mine in the county whose ore can be profitably treated by amalgamation alone. There is only one mill in the county at the present time that is employing this treatment to save part of the values in their ore.

There are twenty-four concentrating mills lying idle in the county and only four working, which shows that there are only a few ores adapted to wet concentration. What most San Juan ores need is concentration by fire instead of water. To be successful the process must be cheap and located at a central point. There is considerable territory adjacent to Silverton where ores can be mined and laid down for $6 per ton. With a treatment charge of $6 per ton at that point ore worth $14 would pay a net profit of $2.

SUMMIT COUNTY.

Journal: There is not a mill in Summit county operated as a custom gold ore mill, and small operators can only get their product treated at intervals and as a favor. There is a good opening for a modern gold mill equipped with appliances for concentrating the values in the mill tailings; a mill that would treat the ore for $2.50 per ton or that would pay 75% of the sampling value of the or, ore even 60%.

TELLER COUNTY.

(Special Correspondence).—The Imperial

G. M. & L. Co., operating on Block 1 of Dexter claim, on Bull hill, have cut the vein at 200 feet depth, the screenings from which ran from three to five ounces gold to the ton. In a drift of 65 feet on the vein assay values of $70 per ton were obtained. A drift now in 60 feet is being driven for the Big Blue Bird vein, and they expect to cut the latter at 75 feet. The company's lease on this property runs twenty-three months from Jan. 1, 1900. The stock is held by W. G. Campbell of Denver, W. L. Beatty of Goldfield and others. The property is under the management of Mr. Beatty. A shipment of fifteen tons gave a return four ounces to the ton. A twenty-two-ton shipment was made on the 16th inst. WASCOTT.

Goldfield, Colo., Jan. 13.

IDAHO.

The Peacock mine, at Seven Devils, has not been sold to the Boston & Seven Devils Co., but nine-sixteenths of it has been bonded by the Northwest Copper Co.

LATAH COUNTY.

At Kendrick the Dewey mine and other properties of the Dewey Co. at South Fork are bought by Toronto, Canada, men, P. Clark and others of Spokane, who get a controlling interest and pay $100,000, of which sum $50,000 will be spent operating the mine. The remaining $50,000 goes to the Dewey Co. to meet the obligations of the company. The purchasers are in charge of operations.

SHOSHONE COUNTY.

Spokesman-Review: The year 1899 has done more for the gold belt of the Cœur d'Alenes by clearing the way for 1900 than by increasing the output for itself. During the year Boston capitalists have bonded twenty-six miles of placer ground remaining unworked in the district. One payment has been made on all of this and two on much of it. It was too late in the season, however, when the work was undertaken to accomplish much, although there has been time for preparation for another year which will surpass any work, in its magnitude, ever undertaken in placer mining in Idaho. Dams are to be erected near the headwaters of the different branches of Prichard creek, to form reservoirs for the storage of water, and hydraulic mining on a large scale will be carried on. Where dredgers can be worked to advantage there will be dredging.

MICHIGAN.

The output of copper mines in '99 is estimated at 80,000 tons, which at 16 cents per pound, represents $25,600,000. In 1880, the Michigan copper product amounted to 40,000 tons, valued at $7,500,000. The output has doubled in twenty years. The value per ton of the product has increased nearly 70%.

The Calumet & Hecla Co. is shipping a large consignment of copper to Russia by way of San Francisco, Nagasaki and Port Arthur, China. The expense of overland shipment is very heavy and the dispatch with which the order is being filled marks urgent requirements, leading to the presumption that the copper so obtained is destined to fill pressing needs in naval and military equipment.

MINNESOTA.

J. J. Hill has leased a large portion of his 5000 acres of iron-ore land on the Duluth, Mississippi & Northern, which road also belongs to Mr. Hill. The iron-ore land is leased to Corrigan & McKinney, of Cleveland, who will mine the ore for shipment. From this tract about 10,000,000 tons of ore have already been taken.

MONTANA.

The State Mining Inspector reports that the number of men employed in the mines of Montana was 13,316 in 1899; in 1898, 11,696.

E. B. Braden, in charge of the United States assay office at Helena, has just given the metal production of the State for last year, showing an increase in the output of $14,091,233.54 over that of 1898.

DEER LODGE COUNTY.

The Anaconda mine is changing its crushing machinery from stamps to rolls. The present crushing capacity is 5500 tons per day, and the substitution of the rolls will, it is thought, permit a crushing of 7000 tons every six hours. The company has six furnaces with a daily capacity of 200 tons each. Three new furnaces will be erected, so that the total blast furnace capacity will be doubled and 2400 tons of ore smelted daily. The hoisting machinery will enable the mine to supply 7000 tons of ore per day for the smelters. The total capacity of the entire plant is now 12,000,000 pounds of metallic copper per month, of which 2,500,000 pounds is the product of six blast furnaces now in use. When the new furnaces are in operation, the entire output will be 14,500,000 pounds per month, or 174,000,000 pounds per annum. It is said that the Amalgamated Copper Co. will increase the output of metallic copper, from Butte alone, by at least 30,000,000 pounds per annum.

MADISON COUNTY.

At Sheridan the Zella M. is equipped with a compressor plant and all work is done with machine drills. The shaft is 180 feet in depth. One tunnel, 500 feet in length, cuts the ledge at a depth of 250 feet.

SILVER BOW COUNTY.

The newest thing in pumping is a six-cylinder, triple expansion condensing mine pump, at the 1100-foot level of the Original mine, designed specially for the place. It is not a strictly high-duty pumping engine, but presents a number of features that render it specially interesting to miners. There are two high pressure steam cylinders, each 9 inches in diameter, two low pressure cylinders, each 22 inches in diameter; duplex water plungers 5 inches in diameter, all of 18-inch stroke. The entire water end is of phosphor bronze of special composition, made to resist the action of acids in the water. There is a jet condenser with a special bronze water end. This engine is to deliver 200 gallons per minute against 450 pounds pressure per square inch, with 100 pounds steam pressure at the throttle, and is expected to show a duty of about 75,000,000 feet pounds, or to perform the work with an expenditure of only 3350 pounds of coal per twenty-four hours.

NEVADA.

DOUGLAS COUNTY.

A 1200-foot tunnel is being run by the Pacific Copper Co., hoping thereby to obtain 500 feet of stoping in high-grade ore.

EUREKA COUNTY.

The Sentinel estimates the miners of that district have received over $126,000 for the ore they have shipped out in the last six months.

LINCOLN COUNTY.

A cyanide plant of 150 tons daily capacity is to be installed in the Horseshoe mine, Deer Lodge district.

LYON COUNTY.

The Rock Point mill and the cyanide plant are both shut down now on account of cold weather and ice in the river.

ORMSBY COUNTY.

(Special Correspondence).—There exists near Carson City a vein of tin ore 15 feet in width, carrying 25% of tin. Negotiations for its sale are now under way and active work will, no doubt, soon commence to develop and operate it on a large scale. Tin ore of 3% is considered good grade.

Carson, Jan. 14.

STOREY COUNTY.

The machinery for the gypsum pulverizing plant at the Mound House is in transit from San Francisco.

WASHOE COUNTY.

The Royal Star M. Co. have been formed to work the old Steamboat gold and copper mine at the southern end of Truckee meadows.

Wallace & Pinney propose to buy the Tri-Metallic and W. H. Teller mines at Antelope, and to pay $4 a foot to Captain Griffin for running a 400-foot tunnel to tap the ledge.

NEW MEXICO.

In the Cochiti mining district the properties known as the Lone Star group have been bought by the Navajo Gold Mining Co. The revenue stamps on the papers called for $1800.

The reported sale of the Cerillos smelter by Stephen Baldwin of Detroit to the Hardscrabble Mining Co. of St. Helena is denied in Santa Fe.

OREGON.

Congressman Tongue is trying to have an assay office established at Portland.

BAKER COUNTY.

Work has been resumed on the Badger mine at Susanville under the management of A. Brile.

The new 10-stamp mill on the Magnolia mine, Granite district, owned by the Magnolia M. Co., W. L. Vinson Mgr., has started.

The Red Boy will sink a three-compartment shaft 500 feet below the present lowest level before drifting is done. The machinery will have a capacity of putting the shaft down 2000 feet. The first purchase of machinery will cost about $40,000.

J. G. English has from the Golconda mine $10,000—the result of a recent run in the new 10-stamp mill.

Two carloads of machinery are on the way for the new smelter at Sumpter.

WALLOWA COUNTY.

A copper strike is reported at the mouth of the Imnaha river, on the Snake River Chief ledge—one of the Hibbs group. The ore is red oxide of copper.

SOUTH DAKOTA.

CUSTER COUNTY.

The Carr mine near Custer, which was found last May by Carr Bros. and which attracted much attention at that time by reason of the very rich gold rock found, is proving a perplexing geological problem to the owners, owing to the irregularities of the vein, which, occurring in a mica schist formation parallel with the strike of the rock, exists as a series of disconnected lenses, difficult to follow until the system of their distribution is understood, which can only be accomplished by development.

PENNINGTON COUNTY.

Machinery formerly in use on the Snow Storm, Bald Mountain, has been moved to the Blue Lead mine, near Hill City, and will be used in driving a tunnel, now in 400 feet, to strike a copper ledge. A man with a hand drill cannot make more than 18 inches a day. With the drills it is expected that from 8 to 12 feet can be made in a day. The tunnel is timbered 300 feet. The ore vein will be reached at a depth of 610 feet.

UTAH.

JUAB COUNTY.

Miner: A great many locators of mining property have been sending one notice of location to the District Recorder and one to the County Recorder for recording. Section 9 of the State mining law distinctly says that both notices must pass through the hands of the District Recorder, and provides a penalty of $500 for failure to comply with these directions. Thus the County Recorder is liable for accepting notices that do not come from the District Recorder, who must insist on duplicate notices and two fees.

SALT LAKE COUNTY.

The management of the Bingham Copper and Gold Mining Co. will immediately let contracts for the new smelter. It will be of the pyritic type, daily capacity 200 tons; two stacks, each of a capacity of 100 tons per day, built in such a way that either may be operated independently.

SUMMIT COUNTY.

The Marsac mill at Park City will be changed to permit handling the ore of the Ontario mine. The Ontario Mining Co. will in future pay dividends quarterly.

TOOELE COUNTY.

The report of the Silver King shows that during '99 it produced ores valued at $1,000,000 and distributed $650,000 dividends. Manager Kearns is driving the drift off the 1300-foot level to tap the ore chute upon its dip next July. The ores marketed showed an average of 45% lead, 46 ounces silver and nearly $5 per ton gold.

The Geyser-Marion Mining Co. from its mines at Mercur produced during '99 43,271 tons of ore, from which it extracted $113,631.59 and netted $18,394.05. The expense of mining, extraction and opening up new ground during the year was $1.43 per ton, actual cost of milling 67 cents, a total of $2.10 for mining and milling.

UINTAH COUNTY.

The $200,000 option on the mines and smelter of the Dyer Mining Co. near Vernal has been relinquished. E. D. Nelson has gone to British Columbia to look for a property that will satisfy his syndicate.

WASHINGTON.

The Times says there is scarcely any snow in the mining districts of Index, Silverton, Sauk, Sultan or Miller River, excepting far up in the mountains. There is less this season than is recorded for any previous year in January.

STEVENS COUNTY.

The Gold Ledge has been inspected by Mgr. Lilienthal and Supt. Crummer of the San Poil and Blacktail mines, Republic. The ledge is 5 feet in width, a portion of the filling not pure quartz. There is in the face of the drift about 3 feet of ore. The working shaft is 135 feet deep.

Deer Trail No. 2 and the Bonanza companies are to be consolidated, with headquarters at Toronto. The capital stock will be $2,500,000. The Deer Trail mine is in Cedar canyon and the Bonanza is at Bossburg. Both are dividend payers, capitalized at 1,000,000 shares each. Stockholders will be given share for share in the consolidated company and the 500,000 additional shares will go into the treasury. Both mines are controlled in eastern Canada, although officered by Spokane men. They will be operated on a larger scale.

FOREIGN.

BRITISH COLUMBIA.

The output of ore in the Rossland camp for 1898 was 116,697 tons; in 1899 it was 183,670 tons, an increase of 66,973 tons. The value of the 1898 product was $2,804,758; of the 1899 product, $3,306,060, a gain for 1899 over the previous year of $501,302.

Carl F. Raht has gone from Libby, Mont., with H. C. Walters, to the latter's copper property, thirty miles north from Vancouver, three miles from the seacoast. The group consists of seven claims, and the lead is from 12 to 28 feet in width. The ore is a copper sulphide, and reported to run from 8% to 15% copper. R. Seifert is foreman. The name of the property is the Britannia.

Vancouver reports the transfer of the White Horse copper group of claims to the Rothschilds for $2,000,000.

At Greenwood J. T. Smith has organized the Republic Gold Mines of Greenwood, B. C., non-personal liability, to acquire the Republic, Nonesuch, Last Chance and Hidden Treasure mineral claims, in Smith's camp, Kettle river mining division; capital $100,000.

The McRae Copper Mines, Ltd., non-personal liability, have been incorporated, to purchase the Ah There and Sidney M. Johnson mineral claims, Deadwood.

A petition has been presented to the Legislature from all the leading mines of West Kootenai, representing $50,000,000 of capital, seeking the repeal of the eight-hour law and declaring it had been prematurely and improperly introduced, and had excluded capital and deprived mine owners of working at a profit. Its constitutionality is challenged, and the declaration is made that, unless it is repealed or amended, it will be necessary to close the mines or cut the wages.

At the Ymir mine a tunnel is being run from the mill to tap the ore body at great depth. The length will be 3000 feet. It is to be made large enough to allow laying two parallel tracks. The gravity tramway now in use will be thus superseded.

MEXICO.

(Special Correspondence).—At a meeting of the stockholders of the Guanajuato Con. M. & M. Co., January 5, 1900, at the offices of the company in New York, the old board of directors was re-elected and the following officers elected for the ensuing year: F. G. Corning, Pres.; Sidney Green, Vice-Pres.; E. A. Wiltsee, Second Vice-Pres.; Thos. J. Hurley, Sec. & Treas. The Exploration Syndicate was also reappointed the New York fiscal agent. The output of the mill for October, November and December averaged about $22,000 per month. The company owns the Sirena mine at Guanajuato, also the San Vicente, the Barragana, and an interest in the Rayas mine.

N. Y., Jan. 6.

SOUTH AFRICA.

J. G. Stowe, the American Consul General at Cape Town, says that the exodus of uitlanders from the South African Republic and Orange Free State has been unprecedented in history.

"Many of these people—the mining population, the bone and sinew of the country," he says, "have scattered over the world. Numbers of them too poor to get out of the country are subjects of charity in the cities of Cape Colony and Natal, and have to be fed. Some have funds for a few days or weeks, but will in time have to be supported by the public, and this in a country that can not or does not produce the foodstuffs for its own people. The English army is fed with supplies from other countries, and, while much of these may have originally come from the United States, they reach here via England. The customs duties and railroad and telegrah revenues have fallen off. As the railroads and telegraphs are owned by the government, a very large source of government support is lost, to say nothing of the employes thrown out of work. Johannesburg, in the Transvaal, and Bloemfontein, in the Free State, are to all intents and purposes deserted cities. Johannesburg, the largest commercial center in South Africa, has, so far as trade is concerned, ceased to exist. This once busy, bustling city, producing monthly over fifteen tons of gold and yearly $60,000,000 worth, is silent. Up to this time goods have reached the Transvaal via Delagoa bay, but it is not supposed that they will long be permitted to enter. The two republics must then live on their own resources. Their crops are ready for the sickle, but can not be cut, as the men are off to the war. "Prices are so high that the trade papers refrain from publishing the usual column of 'market prices.' Large quantities of gold en route to seaports in this colony for shipment to England have been taken by the Boers. Representatives here of export commission houses of the United States are constantly booking and cabling large orders, particularly of foodstuffs, but word comes from the canners of meat and fish, makers of flour, corn meal, etc., that they have about all they can do to supply the home demand, and are many weeks or months behind orders."

THE KLONDIKE.

The Yukon Sun estimates 7000 to be the present number of men at work in the Klondike.

Latest Market Reports.

SAN FRANCISCO, Jan. 18, 1900.

SILVER—Per oz., Troy: London, 27⅜d (standard ounce, 925 fine); New York, bar silver, 59½ cts. (1000 fine); San Francisco, 59½: Mexican dollars, 48½c.

Renewed buying of silver by the Indian Government, the Statist says, can not be much longer delayed, in consequence of rupee coinage requirements, and this will lead doubtless to marked improvement in the price of silver.

The director of the mint has ordered that the New York U. S. assay office furnish gold bars for exports from that port at a charge of 4 cents per $100 instead of 10 cents, which has been the rate for eight years. The charge was raised in the belief that it would restrict gold exports. It is now expected that the foreign bankers will utilize gold bars again.

COPPER. — New York, Lake, $16.50; electrolytic, $16.00; casting, $16.12½; St. Louis, $16@16.25; San Francisco, 17⅛@18. Mill Copper plates, 23¾c; bars, 25¾@27c.

Recently Declared Mining Dividends.

Grand Gulch M. Co., Utah, 1 cent per share, $2400; Jan. 20.

Daly-West M. Co., Utah, 20 cents per share, $30,000; Jan. 20.

Iowa G. M. & M. Co., Silverton, Colo., ½ cent per share, $5000, Jan. 10.

Vindicator Con. G. M. Co., quarterly, 5 cents per share, $50,750; payable Jan. 26.

Alaska-Treadwell M. Co., forty-third dividend, 37½ cents per share, $75,000; payable Jan. 29.

Alaska-Mexican M. Co., twenty-first dividend, 10 cents per share, $18,000; payable Jan. 29.

The following dividends were declared by Utah mines during the first ten days of January: Ontario, $45,000; Mercur, $50,000; Silver King, $75,000; Daly West, $30,000; Swansea, $5000; Mammoth, $40,000. Total, $245,000.

Following is a list of Cripple Creek, Colo., mining dividends during the first ten days of January: Gold Coin, $10,000; Golden Cycle, $10,000; Gold King, $30,000; Last Dollar, $30,000; Lillie, $11,250; Modoc, $5000; Mary McKinnie, $30,000; Portland, $90,000; Raven, $10,000; Strong, $25,000; Vindicator, $50,750; Amazon, $12,000. Total, $314,000.

In Cripple Creek, Colo., on the 15th, the regular dividend of the Portland G. M. Co. for $60,000 and the extra dividend of $30,000 was paid; the Amazon M. Co. paid its first dividend, 2 cents a share, 600,000 shares; the Gold Coin M. & L. Co. declared its January dividend, 1 cent a share; the Vindicator Con. G. M. Co., quarterly, $53,250, dividend is payable Jan. 26; Lillie, Cripple Creek, G. M. Co., $11,367.18, payable Feb. 1; Raven G. M. Co., $10,000, Jan. 20; Gold King M. Co., 3 cents a share, 1,000,000 shares, Jan. 20.

Commercial Paragraphs.

THE Electrical Construction Co. now occupy quarters at 429 Seventeenth St., Denver, Colo.

GILBERT WILKES & CO., mechanical engineers, have opened an office in the E. C. Bldg., Denver, Colo.

FIELD & GOODING have succeeded to the assaying business of W. C. Menger, 1747 Lawrence St., Denver, Colo.

R. N. STEWART has opened an office in Denver for the Crocker Wheeler Co., electrical manufacturers, of New York.

THE Joshua Hendy Machine Works, 38 Fremont St., San Francisco, is now the local agency for the Jackson Drill & Mfg. Co., 1756 Larimer St., Denver, Colo.

DURING the past year the Colorado Iron Works of Denver, Colo., built complete smelting furnaces as follows: Great National Mexican Smelting Company, Monterey, Mexico, 2 lead furnaces 44 in. by 144 in., ordered June 15th; Great National Mexican Smelting Co., Aguascalientas, Mexico, 1 copper furnace 44 in. by 150 in., ordered June 22d; Germania Smelting Works, Salt Lake City, Utah, 1 silver-lead furnace 45 in. by 140 in., ordered July 8th; Val Verde Copper Company, Limited, Prescott, Ariz., 1 copper furnace 42 in. by 120 in., ordered July 31st; Great National Mexican Smelting Company, Monterey, Mexico, 2 lead furnaces 44 in. by 144 in., ordered August 26th; A. Y. Cochrane, Tomichi, Gunnison county, Colo., 1 silver-lead furnace 36 in. by 120 in., ordered Aug. 29th; Omaha & Grant, Denver, 1 silver-lead furnace 36 in. by 133 in., ordered September 18th; United Globe Mines, Globe, Ariz., 1 copper furnace 42 in. by 144 in., ordered September 21st; Vulcan Copper Mining & Smelting Company, Sodaville, Nev., 1 copper furnace 42 in. by 80 in., ordered September 22d; Montana Ore Purchasing Company, Butte, Mont., 2 copper furnaces 40 in. by 120 in., ordered September 27th; Copper King of Arizona, Cochise, Ariz., 1 36 in. circular copper furnace, ordered November 1st; Whipsaw Copper Mining Company, Whipsaw, Ariz., 1 42 in. circular copper-matting furnace, ordered December 7th. This is exclusive of jackets, repairs, etc.

SITUATIONS WANTED.

Experienced Metallurgist and Cyanide Expert desires position. Thorough chemist and assayer. Technical graduate. Speaks Spanish. Capable of taking full charge of gold mill. Salary very reasonable. Address "Millman," this office.

A YOUNG MAN WITH SEVERAL YEARS' practical experience in drift and hydraulic mining, especially hydraulic elevating, is open for engagement to manage or superintend works of this kind. Reference best in the State. Address J., care of Mining and Scientific Press.

MINING ENGINEER WANTS POSITION.

Is a good chemist and metallurgist with thorough practical experience in stamp milling, cyaniding and chlorinating. Recently had charge of stamp mill and cyanide works. Has had excellent experience in examining and reporting on mines, chiefly gold. Speaks Spanish, also French and German; age 30. Moderate salary accepted. Address DENVER, Mining and Scientific Press.

Position Wanted

By Experienced Metallurgist and Mining Engineer, preferable in charge of a cyanide plant or as chemist and assayer. Thoroughly familiar with all processes for gold extraction. Technical graduate. Best of references. Salary moderate. Address W. C. A., care this paper.

WANTED.

Wanted.—Foreman for Twenty-Stamp Mill.

One hundred and fifty dollars per month and board. Address THE WM. HAMILTON MFG. CO., 316 S. Euclid Ave., Oak Park, Illinois.

WANTED.—A STAMP MILL MILLWRIGHT.

Permanent position; salary $1800 per year. Address F. T. SNYDER, The William Hamilton Mfg. Co., Nelson, B. C.

"SMOOTH ON" CASTINGS.

An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work, applied by mixing with water; hardens quickly and expands in hardening. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

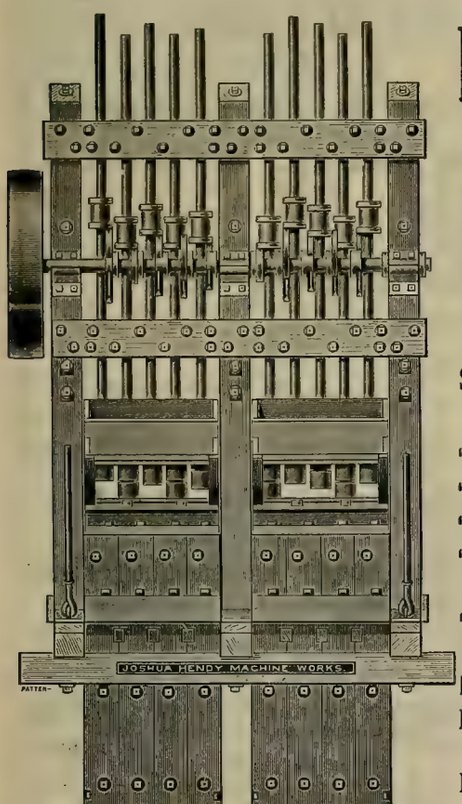
HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.



The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

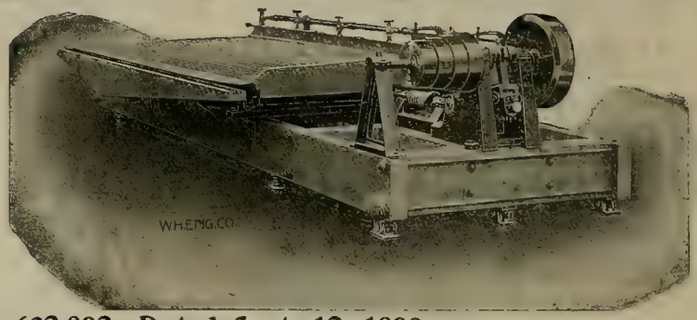
PRICE, $450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

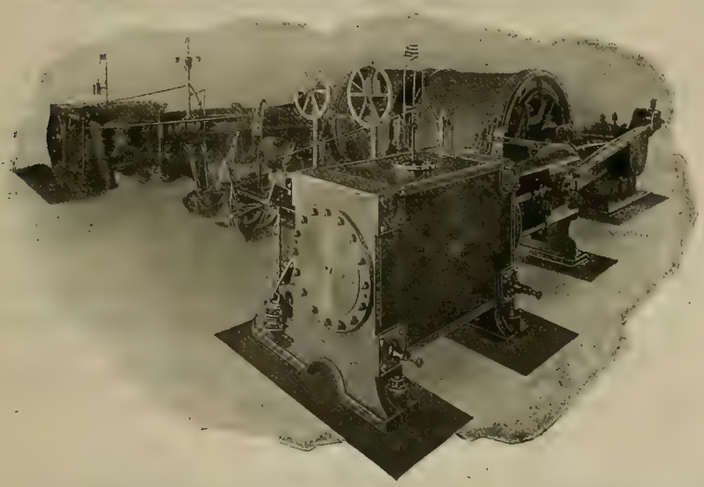
SEND FOR CIRCULARS.



These Machines are Kept in Stock Ready for Immediate Shipment.

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.



We have reports from mills employing Cammett concentrators for the treatment of ores containing galena, iron sulphide and zinc blende, that they are regularly producing on each table three distinct concentrates—one of galena, one of iron sulphide and one of zinc blende, each of which is commercially clean.

Practical experience with the Cammett concentrator proves that it **saves** and **delivers** into the **concentrates box** slimes so fine that to prevent them from being lost from the **concentrates box** it is necessary to provide several additional overflow tanks.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address DEWEY, STRONG & CO., Patent Agents, 330 Market St., San Francisco, Cal.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: **GATES IRON WORKS,** Dept. UU, 650 Elston Ave., CHICAGO.

Up-to-date Miners who value their lives use

NO. 2 LAMP.

McINTYRE'S DRY BATTERY

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored, where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

No. 1 weighs 2 lbs., 1¼ C. P.	Price complete, $4.50.	For meter reading only.
No. 2 " 3 " 4 "	" " 6.00.	For Miners and general use.
No. 3 " 12 " 10 "	" " 12.00.	For several persons to work by.
No. 4 " 3 " 4 "	" " 6.00.	Boiler Makers and Chimney Sweeps.

SAMPLE LAMP SENT ON RECEIPT OF PRICE. Illustrated Catalogue is yours for the asking.

ASSESSMENT NOTICES.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of December, 1899, an assessment (No. 22) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of January, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 27th day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 22) has been postponed to THURSDAY, the 25th day of January, 1900 and the day of sale from the 27th day of January, 1900, to SATURDAY, the 10th day of February, 1900.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office, Room 31, No. 214 Pine street, San Francisco, California.

SOUTH PALOMA GOLD MINING COMPANY, Limited.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Directors, held on the 6th day of December, 1899, an assessment (No. 1) of six-tenths (6-10) of a cent per share was levied upon the capital stock of the corporation, payable immediately to the secretary, John F. Barnett, at Room 22, No. 222 Sansome St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of February, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on the 19th day of February, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

JOHN F. BARNETT, Secretary.

Room 22, No. 222 Sansome St., San Francisco, Cal.

QUINCY MINING AND WATER COMPANY.—Location of principal place of business, San Francisco, California; location of works, Spanish Ranch, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of January, 1900, an assessment (No. 2) of forty cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 439 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of February, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

THOMAS QUIGLEY, Secretary.

Office—No. 439 California street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of January, 1900, an assessment (No. 10) of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of February, 1900, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

Why Detroit Lubricators Should Be Preferred.

In addition to their many other good qualities, the Detroit Lubricators are made extra strong and heavy, each one being tested at a pressure of 300 lbs. to the square inch before it is allowed to leave the factory. This is probably twice as high a pressure as they will ever have to work under, so they are very durable and longlived, and, unless injured by accident, will not require any repairs for years. For this reason, they are particularly well adapted to users in the Rocky Mountain district and on the Pacific Coast, where it is expensive and inconvenient to get repairs. Our catalogue showing our different styles of sight feed lubricators, glass and brass oilers, oil pumps, oiling devices, etc., will be sent on application.

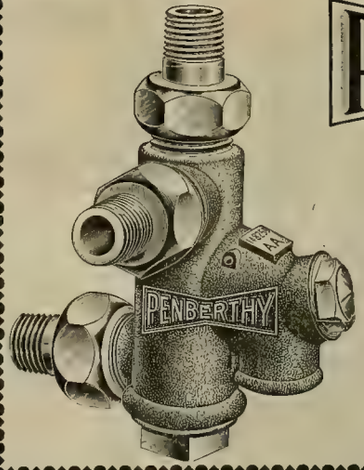
Made with Screw Ends from ¼" to 6",
Flange Ends 2" to 6" sizes.

BEST IN QUALITY.
LOWEST IN PRICE.
THE ENGINEERS' FAVORITE.

These Valves are made of cast iron and all wearing parts of gun metal. They are superior to the common, cheap, brass valves with which the market is flooded.



WHY?

BECAUSE they possess all the advantages of a cast iron pipe fitting (Elbow, Tee, Coupling, Union, etc.) namely—are heavy and rigid—not injured by expansion and contraction or rough handling in pipe fitting. TAKE PRESSURE FROM EITHER END. Body and hub are held together by a steel clip, consequently always easily taken apart. Joint between body and hub made permanent by an imbedded seamless oval copper wire washer. If you desire the BEST, STRONGEST and MOST DURABLE valve for general purposes on all ordinary pressures, use this valve. IT IS A STANDARD FITTING, OF NEAT APPEARANCE and FULLY WARRANTED TO SATISFY. Made also in All Iron for Cyanide Plants. Try them and be convinced. Specify them and order through your dealer. Our Catalogue of superior Steam Specialties FREE for the asking.

THE LUNKENHEIMER CO., Cincinnati, Ohio, U. S. A.,
SOLE MANUFACTURERS.

BRANCHES: NEW YORK, 26 Cortlandt St.; PHILADELPHIA, Bourse Bldg.; NEW ORLEANS, 316 Magazine St.; LONDON, S. E., 35 Gt. Dover St.; MEXICO CITY, Puente de San Francisco No. 6.

200,000 IN USE.

TRADE PENBERTHY MARK.

AUTOMATIC INJECTOR.

The World's Best Boiler Feeder.

RISDON IRON WORKS,

SAN FRANCISCO, CALIFORNIA.

Cable: "Risdon's." Code: A. B. C. & Leiber's.

MANUFACTURERS OF

Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

Send for Dredging Catalogue No. 17.

—WE ALSO BUILD—

All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

THE HALLIDIE ROPEWAY

For Transporting Ore, Fuel, Earth, Sugar Cane, etc., by Wire Ropes.

SIMPLE, ECONOMICAL, PRACTICAL, DURABLE.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY.

WIRE TRAMWAYS (Single and Double Rope Systems),

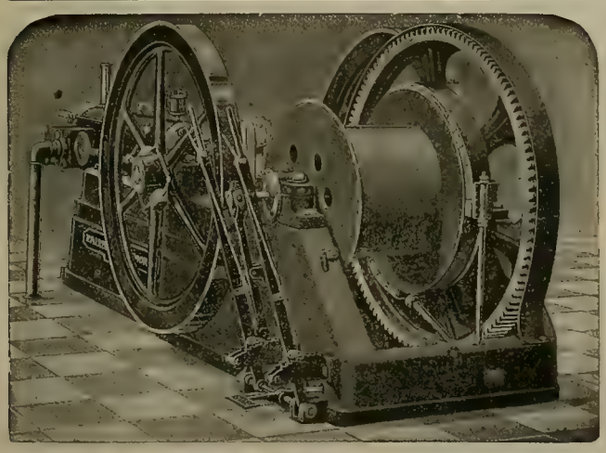
Cableways, Transmission by Wire Ropes,
Incline Planes, Cable Grips,
Logging by Cables, Automatic Loaders,

PLOWING, SCRAPING AND TRANSPORTING by Wire Ropes,

DESIGNED, SUPPLIED AND ERECTED. Estimates Furnished.

Improved GRIP PULLEY.

Patents Nos. 483,442; 610,353.



EFFECTIVE, SIMPLE, AUTOMATIC.

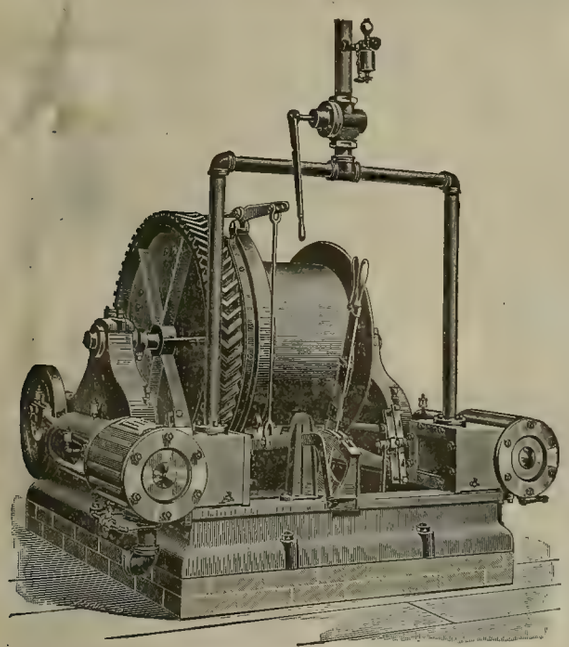
Saves Wear on Wire Rope and Cable.

Send for Illustrated Pamphlet. Correspondence Solicited.

CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

FAIRBANKS-MORSE GASOLINE-DISTILLATE GEARED HOISTER.

An efficient and reliable combination of a Fairbanks-Morse Gasoline-Distillate Engine on the same base with a Friction Hoist. Modern and up to date. We publish a special catalogue describing our Hoister which we gladly mail prospective purchasers.



FAIRBANKS-MORSE GASOLINE-DISTILLATE ENGINES.

ALL SIZES UP TO AND INCLUDING 54 HORSE POWER.
For Pumping, Milling, Lighting, Air Compressors, Etc.

FOR CATALOGUES AND FULL INFORMATION, ADDRESS

FAIRBANKS, MORSE & CO.,

Gas Engines for Power and Pumping.

Small and compact gas or gasoline engines for pumping have an increasing demand. The accompanying illustration shows one with pumping attachment, for pumping water from deep wells and elevating to tanks any desired height above the well. This engine is made in two sizes, 1½ and 3 H. P. The base of the 3 H. P. occupies a floor space of 17x33 inches, and the pump tubing is attached to the base near one corner. The pump is operated by a walking beam attached to one side of the cylinder. The power is taken from a small pinion on the main shaft to a large cog wheel on another parallel shaft with friction disks. The pump can be started and stopped while the engine is in motion. Two balanced wheels go with each engine, but only one is shown in the cut.

Gas Engine for Power and Pumping.

The material used in the make of the engines is forged steel shafts, cut gears and bronze bearings. About 25 feet per hour of gas, or its equivalent in gasoline, will run size No. 1, and about double that quantity will operate size No. 2 to its full capacity. Ignition is caused by means of an incandescent tube. The cylinder is water jacketed and provided with sight feed lubricators. When using gasoline it is safely stored in a barrel or tank outside of the building, at any desired distance, and may be placed in a pit in the ground. The amount of water pumped will depend on the distance it is to be elevated. In a general way, size No. 2 (3 H. P.) will lift 5000 to 10,000 gallons per day of ten hours from a well 200 feet deep, and elevate it 50 to 100 feet higher to a storage tank or reservoir. In addition to pumping the engine can be used for running light machinery which can be driven by a belt.

Placing a Hand Pump.

When calculating to place a hand pump trust nothing to suction; place the cylinder far enough above the bottom to insure prompt action of the valves, and near enough to the water to avoid the necessity of an absolutely perfect airtight piston, except as the water shall make it so. For wells of depths greater than 15 feet, place the cylinder within 12 feet of the bottom and let the pipe extend, with a foot valve on end, to within 6 or 8 inches of the bottom. The friction in pipes is as the square of velocity: velocity increases as the squares of the diameters. It is poor economy to try to make a small pump do the work of a large one by crowding it. The velocity of a given volume of water flowing through a 2-inch pipe would be increased four times if made to flow through a 1-inch pipe; the friction would be increased sixteen times, which shows the advantage of using large pipes.

NEARLY every great structure in San Francisco was erected with money made by miners. Nevada and California miners have practically built up San Francisco, and the great stream of California mineral wealth still steadily pours into the metropolis. One sees little of such manifestation of other forms of State development compared to the manifestation of solid wealth from the mines. Gold is the one commodity that is not controlled by corporate or freight conditions, that is of constant value at a constant price, that is sought by the purchaser, is not subject to competition and is constantly under the control of the producer till marketed.

BUTTE, MONTANA, wants a mining and stock exchange. It cites other mining communities, of, no greater producing powers than Butte, where such institutions exist, and thinks Butte brokers might as well have the daily handling of thousands of dollars as members of the Boston Exchange. It is argued that a local exchange would tend to keep the money in Montana and develop native resources. Some day Butte may also conclude that it would be more financially economical to establish great manufacturing establishments to work up the "raw material," as they call the copper ingots in the East, though to a Montana miner such commodity has much the appearance of a finished product.

WHAT this paper has so often suggested regarding the necessity for practical knowledge in mining work is well exemplified in a little special correspondence from Silver City, New Mexico, on page 99. It is brief, but tells the whole story. A mining property had been handled by men who were not acquainted with their business, development work had not been done right, and immense expenditure in top-heavy management and surface salaries had discouraged the men who were putting up the money, with the result that work was shut down and that part of the district got the customary "black-eye." Two or three miners—plain, ordinary, every-day miners, the kind of men who don't know it all, but have a middling fair idea of what is necessary in such a matter—took hold, put up $12,000, ran things intelligently and economically, and in eight months, on a $12,000 investment, cleared $60,000 net profit. The difference is in the know how. The men who first had hold would doubtless say "No" were they asked, "Does mining pay?" The three miners would as certainly say "Yes." Mining—real mining—intelligent, economical, business-like mining, will pay; but it is in mining, as in any other legitimate business, where ignorance is expensive, and a man must know what he is doing and have some good reason for paying out money, or he will quit loser.

As to Selling a Mine.

It is not easy to sell a mine, largely because of methods of mine owners. Most "mines" are unproductive; they have to be made; they are more than a "prospect," but not developed enough to be really deserving of the name "mine." Those mines, or rather their owners, must give inducement to capital, and while occasionally a man or a corporation is fooled into buying a "mine" that isn't much more than a prospect and paying the price of a "going" mine for it, such a transaction is about the worst thing that can happen a district, for it is sure to be found out, to the irretrievable injury of that whole region. The most common mistake on the part of the mine owner, provided he wants to sell, is to set too high a price on his property. The would-be buyer can get along without him better than he can get along without the purchaser, and while a man is justified in getting all that a thing is worth, he overreaches and spoils a sale by exorbitant or impossible requirements at the outset. It is also to be remembered that mines are now rarely bought by individuals and, still rarer, so developed to any great extent. It is in mining as in everything else, the day of aggregation of capital, and twenty men's money will go into projects that one man's money could not touch or wouldn't risk. This paragraph is inspired by a recent talk with a mine owner who has a really good property and that by the investment of $30,000 or $40,000 could in all probability be made a paying mine. He said, in conversation with the writer, that he had just refused $25,000 for it. When asked why, he said: "Well, if it's worth $25,000 to ——, it's worth that to me." But it isn't. Right there is his mistake. He has lived, or rather existed, alongside that claim half his life—the best of his years; he had a chance to get something he never had before—$25,000, a comfortable little sum, at once. But he said: "—— would have sold it to a company for $50,000. Do you suppose I'd let my mine go for $25,000? Not much." He will live and die right by his mine and never have one-tenth of $25,000 at one time, just because he thinks that if it is worth a certain sum to a man who can control or secure capital to make a mine of it, it is worth that much to him in its undeveloped state. It's hard enough to sell a mine without allowing such absurd notions to overshadow one's business judgment. "But," it may be asked, "you wouldn't advise a man to sell a property for $25,000 when he knows it is worth a great deal more, and that the buyer will make two or three times over on the purchase?" A man should always do the best he can. If he has "go" enough about him to enlist capital and develop his property and make a mine of it worth $150,000, he were foolish to let any promoter or middleman or anybody else get his property from him for less than its proved worth, but if he has been trying to do that for twenty years and finds he isn't able, he is more foolish to refuse $25,000 offered him by some one else for the chance that he has never been able to have tested: $25,000 beats nothing, and nothing is what this particular man has had and, we fear, will have. Of course it is a good joke on a "promoter" or a responsible man with a proffer to ask an impossible price and freeze him out of the place, but, somehow, the joke is oftenest on the one who does that. The would-be purchaser can go elsewhere, and the man whose property is worth as much to him as it is to any one else can keep right on owning it and camping alongside of it till he is old and forgotten.

A Mistake of Terms.

An inventor makes a claim of remarkable merits for superheated water for light and heavy transportation. He says: "The water is heated in upright steel tubes to 150° above temperature of steam in a locomotive. When released into an engine it expands nearly 1000 times and performs the services required of a storage power." This is a mistake. Water cannot be superheated. Superheating means a greater heat than is due to the pressure of evaporation, and is not applied to liquids. Vapors or steam may be superheated or given a higher temperature than is due to their evaporative pressure. A full boiler may be heated to any reasonable degree of temperature above 212° F., but is subject to the steam pressure due to the temperature, as well also the enormous pressure of the expansion of the water, which no boiler can resist. In all boilers making steam under pressure the water is at or very near the temperature of the steam; at 100 lbs. pressure the temperature is about 338° F. Hot water circulating pipes have been in use with a water temperature from 500° to 600° F., but the pressure was in proportion to the temperature.

A New Ruling.

The Secretary of the Interior has reversed existing rulings of the Commissioner of the General Land Office in a matter of general importance to miners. It concerns applications for mining patents. The General Land Office has all along held that where a corner of an adjoining agricultural claim cuts into a mining claim, patent for the latter could not be secured in its entirety where a portion had previously been patented as agricultural. The Secretary of the Interior reverses this ruling. The case came up from Coulterville, Mariposa Co., Cal. In '84 two men made a lode location. In '86 another man made homestead entry adjoining, and one corner of his claim, 4.63 acres, conflicted with the mining claim and overlapped the lode line. This latter claimant made final proof of his homestead entry and patent was issued in '92. In '95 a San Francisco company bought the mining claim and in '97 made application for patent to it as a whole, including that part previously patented to the agricultural claimant. The latter gave a quit claim deed of the 4.63 acres to the miners and this was filed with their application for patent. The application was refused by the Commissioner of the General Land Office, and, upon appeal, has been allowed by the Secretary of the Interior, whose argument is that when the agricultural claimant made his homestead entry and submitted final proof thereon, in connection with both of which he represented that the land embraced therein was non-mineral and contained no mining claim or known ledge or vein bearing valuable mineral deposits, the ground in conflict was known to be mineral land and was not subject to homestead entry. Under these circumstances the United States could successfully maintain a suit to vacate the patent to the extent of the ground in conflict, and when such a suit can be maintained the United States may accept a reconveyance of the ground for which a patent was thus wrongfully obtained, thus accomplishing by voluntary act of the parties all that would be accomplished by a suit in court. Such a reconveyance having been made, the Land Department is authorized to issue a patent to the mineral claimant for the ground in question.

A Third System of River Channels.

In this issue appears the first part of an article on gold dredging, the latest form of American gold mining. Reference is here made to it because of its progressive character, and because so much is yet to be learned about it. When first begun it was supposed that only in the beds of streams, or along the meanders of their course, could be found suitable or profitable dredging ground. A Butte county, Cal., operator states that it is now evident that in connection with river dredging for gold there exist modified conditions similar in general to those appertaining to drift mining, a form of mining peculiar to California. In drift mining the gold gravel is found in the beds of ancient river channels—old streams that æons of centuries ago coursed at right angles to the rivers of to-day. These prehistoric water courses are capped with lava. In similar manner, but far more recent, and covered with clay and silt, instead of indurated lava, is argued that in less remote geological periods there was a third and hitherto unknown direction of California water courses, and by diligent prospecting suitable dredging ground may now be found at almost right angles to the present bed of the stream, along the course of streams less ancient than the lava-capped channel of the drift miner, but remotely antedating the present geologic period. The California miner referred to, after considerable practical research, is of the opinion that when this matter, which is advancing from a theory to a demonstrated fact, is thoroughly shown to be so, the area of California dredging ground will be greatly extended, and along the former courses of present streams will be found profitable employment for these latest gold mining devices.

Concentrates.

SULPHUR in plenty is found in Nevada, Utah, Lower California, Texas and Louisiana.

THE Yuba, Cal., Electric Power Co.'s experience with aluminum wire has not been wholly satisfactory.

THE relative electric conductivity of aluminum as compared with copper is as .56 to 1.

EQUAL parts of carbolic acid and olive oil smeared over polished steel will preserve its brightness in any climate.

THE volumes of spheres vary as the cubes of their diameters.

THERE is an aluminum telephone system in operation between Pittsburg and New Kensington, Pa., eighteen miles.

THE face side of a rubber belt should be next the pulley; it gives a better contact and is less liable to slip and wear at the lap seam.

A ROUND steel bar, 3½ inches diameter, will weigh 2½ pounds per inch of length: if 7 inches diameter 10.93 pounds per running inch.

ANTHROPOGEOGRAPHY means that branch of geography which treats of the earth in its relation to man—a large circle of science and knowledge.

NO biennial report has been issued by the California State Mining Bureau for some years. The latest was by State Mineralogist Crawford, in 1896.

CALIFORNIA gold dredging is a profitable form of gold mining. The Feather river dredgers near Oroville are credited with a daily profit each of from $100 to $150.

LIQUID chlorine may be bought from John Taylor & Co., 63 First St., San Francisco, the Western Chemical Co., Denver, Colo., or Roessler & Hasslacher, N. Y. City.

FRENCH capital invested in mining has mostly been in Russia and South Africa, a little being done in that direction in California, the latter being uniformly profitable.

SO FAR as known, the first steam quartz stamp mill in California was put up by Wm. Irvine in March, '52, one and one-half miles north of El Dorado, south of the Mokelumne river.

THE noticed fluidity of metals below their melting points may be explained on the hypothesis or assumption that the molecules of solids, like those of fluids, have not all the same velocity.

WHITE LEAD of good quality is manufactured electrolytically. Acetic acid is not used. The lead is acted upon with nitric acid generated by electricity, and the operation is swift and automatic.

THIS paper, in bound volume, will be found at the Paris Exposition in its appropriate place. At the Chicago Exposition, '93, it was the only journal of the kind that received the special award designated.

THE American Smelting & Refining Co., during the week ending the 13th inst., deposited in the United States mints 28,369 ounces gold, valued at $586,424, and exported 807,948 ounces silver, valued at $476,689, a total of $1,063,113.

ANDORITE is an unusual ore of silver, occurring in short prismatic crystals, metallic luster, dark lead or steel gray color, blending to black. It contains: sulphur, 23.32%; antimony, 41.91%; lead, 22.07%; silver, 11.31%; copper, 0.69%; zinc manganese, 0.7%.

ANY advantage of using cyanogen bromide is probably due to its acting as a storage of cyanogen that can be drawn upon as needed by the dissolving gold, and that it can be added in just the quantity required. Further, it seems to have no decomposing action on the potassium cyanide.

IT is unfair to Tuolumne Co., Cal., to speak of it as a "pocket county." There is or was a pocket region in that county, but it is nearly worked out, and, meanwhile, rich milling mines have been developed that compare favorably in output and profit with any other mines in California.

TWENTY-FOUR carat gold is pure gold; 22 carat gold has 22 parts of gold, 1 of silver and 1 of copper; 18 carat gold has 18 parts of pure gold and 3 parts each of silver and copper in its composition; 12 carat gold is half gold, the remainder being made up of 3½ parts of silver and 8½ parts copper.

THE South African war has checked the demand there for American mining machinery, but the great local demand continues to tax the ability of manufacturers to keep up with orders. One who wants a special plant of any magnitude should not expect it for six months after the receipt of order.

THIS paper constantly solicits from practical mining men everywhere accounts of their mining, milling or other daily experience or operation. Being the recognized medium of exchange among miners of such practical experience, in no way can a wider or more appreciative audience be secured.

GOOD mill and concentration work is done at several leading California mines. Concentration of auriferous sulphides at the Kennedy mine, Amador county, may be cited as of high excellence. At the W. Y. O. D., in Nevada county, gold ore is treated for less than $6 per ton. The latter mine is credited with clearing over $60,000 in '99.

THE most expensive manufactured product in the world is charcoal thread, used for incandescent lamps. It is manufactured in France and sold by the gramme—15½ grains. Reducing its price to the basis of pounds, it appears that the filaments for lamps of twenty candles are worth $8000 per pound. They have a diameter of 0.0394 in.; it would take about 1,000,000 of them to weigh a pound.

AN engineer who read the remarks in last week's "Concentrates" about a thumping engine says that often when an engine pounds, apparently for no reason, if it is given just a little more compression, the thumping will either stop entirely or get worse. If the latter, then another change in the valve and a little less compression does the business. A change seems what is needed, the compression being too much or too little to let the engine slip smoothly over the center.

AS SOUTHERN and central California has State mine examiners, northern California thinks it is entitled to similar consideration. Accordingly the Shasta County Board of Supervisors has adopted a resolution asking the Governor to apportion one-fifth of the $20,000 appropriation to scientific mining examination to Shasta, Siskiyou and Trinity counties. The Supervisors of the two latter counties propose to adopt similar resolutions. These three counties in '99 produced a large part of the State's mineral output.

THE Montana Mineral Lands Commission works very well. So would the California Mineral Lands Commission, had corporate influence and local apathy not succeeded in nullifying honest effort to secure the passage of the measure that this paper originated and so long and strenuously advocated. So many other matters claim the attention of a journal like this that it is impossible to more than briefly allude to this matter, but those interested will find a full history of the movement in the volumes from '94 to date.

SO MUCH that is new and necessary awaits weekly answer in "Concentrates" that it is not deemed advisable to repeat information recently given. By consulting the indices of previous volumes, it is often easy for the inquirer himself to find an answer to a common question. In this case, however, it is again stated that on a mining claim located in 1900 the locator has until Dec. 31st, 1901, to do the necessary $100 assessment work; but any work done in 1900, much or little, will not count for 1901. Whatever work is done this year, $100 additional must be done next year to legally hold the claim.

DRILLS for granite for best effect should have their cutting edge at an angle of 75°, and if a single blade, should have the point a little one side of the center. By this shape the side thrust of the drill gives it a clearance and prevents sticking. Careful and slow heating to as low a heat as will allow the particular brand of steel to harden is desirable. Harden in salt water: one quart of salt to a pail of water. Some tool sharpeners add two ounces of yellow prussiate of potash to the pail of salt water. The principal aim should be to work the steel at a low red heat, avoid burning the corners, and not draw the temper.

NEAR Argostoli, on the coast of the Greek island of Cephalonia, there are currents of water, coming from the sea, and disappearing in the land, without visible return, which are so strong and constant that they were long used for driving the undershot water wheels of flouring mills. This use has been discontinued in recent years, by reason of the erection in the region of large modern mills, which have rendered unprofitable not only the small and rude sea mills, but also the once numerous windmills of the island. But the sea currents still continue to flow with unabated force and volume. The daily amount of water thus disappearing in the porous and fissured limestone is estimated at approximately 6,000,000 cubic feet.

THE tensile resistance of various wires is ascertained by practical experiments conducted in testing machines, which usually indicate the result in pounds. In construction and action they are similar to cement and other metal-testing appliances. The specimen is secured in a fixed jaw or clamp, the opposite end being grasped by a similar device, connected with a graduated lever, provided with a movable weight. Mechanism is also used for indicating the number of twists or bends a sample of wire will withstand in a given length without breaking or fracturing. The usual twisting tests are applied to samples 6 or 8 inches long. Good qualities of crucible steel wire of correct temper should give an average of forty turns in a length equal to 100 times its gauge or diameter without rupture.

THERE are several methods of closing cracks in cast iron. A rapid and certain way is as follows: The leaking metallic cylinder is filled with a certain quantity of perchloride of iron, the liquid compressed until globules appear on the external surface. The cylinder is then impregnated with perchloride of iron right through, as regards its thickness. Any perchloride in the cylinder is then emptied out, and filled with ammonia at 22° B., this being also subjected to compression. The perchloride of iron in the metal is thus transformed into hydrated oxide of iron, first frothy, but soon by pressure becoming rough and compact. Some hydro-chlorate of ammonia remains, which soon reacts on the iron, and is eventually converted into an oxide compound, adding itself to the first. The leaks noted at the beginning of the operation stop when the ammonia moves out externally.

CAST IRON weighs 444 pounds to the cubic foot; a 1 inch square bar will sustain a weight of 16,500 pounds; bronze, weight 525 pounds, tenacity 36,000; wrought iron, weight 480, tenacity 50,000; hard "struck" steel, weight 490, tenacity 78,000; aluminum, weight 168, tenacity 26,000. One is accustomed to think of metals being stronger than wood, and so they are, generally speaking, if only pieces of the same size be tested. But let equal weights of the two materials be compared, and it will then be found that several varieties of wood will prove stouter than ordinary steel. A bar of pine just as heavy as a bar of steel 1 inch square will hold up 125,000 pounds, the best ash 175,000 and some hemlock 200,000 pounds. Wood is bulky, occupying ten or twelve times the space of steel.

IN the electrolytic extraction of quicksilver, the cinnabar is crushed fine and treated with a hot solution of sodium-sulphide containing caustic soda. The electrolytic vats are iron, and may be used as cathodes; the anodes of sheet steel. The mercury can be separated from the upper part of the cell, and is enriched with equivalent amounts of copper, silver, zinc, cadmium, nickel, and iron in the lower or anodic compartment of the cell. The solution on issuing from the cell is passed through a series of vessels, in which the silver is displaced by copper by chemical action. Copper equal to about one-fourteenth of the weight of the alloy used has to be consumed in these to affect precipitation. It is not possible to remove the last traces of silver by this method, but the amount found in the deposited copper should not exceed 0.3% when the process is working satisfactorily. After passing through a series of the sulphide solution, by using a current density of 0.5–0.8 ampere per square decimeter and an E. M. F. of two volts the electrolyte can be used again for extracting fresh ore after addition of sulphur.

THE latest report of the Alaska-Treadwell Gold Mining Co. is for the year ending May 31, 1899. For that period Supt. Corbus reports that there were 250,408 tons ore mined and milled at a cost of $193,637.99, or $0.773 per ton. That amount of ore was crushed at the 240-stamp mill at a cost of $69,571.67, or $0.2776 per ton; in the mill steam power was used 111½ days, and water power 241¾ days. There was an average crushing of 710 tons per day, or a trifle less than three tons per stamp per day. The new 300-stamp mill began May 6. It is on the beach adjoining the chlorination works. Each stamp weighs 1050 lbs. In this mill there are no concentrators. The mill is valued in place at $326,310.24. Chlorination of 3,196.6 tons of sulphurets cost $16,927.82. The gold yield per ton of the 250,408 tons of ore mined and milled was $2.71; the cost of operation was $1.28 per ton, leaving a profit of $1.43 per ton. Work began at that mine in '82. The gold yield per ton has varied from $4.40 per ton in '88, to $2.31 in '98; the cost of treating the ore per ton has varied from $2.25 per ton in '87 to $1.08 per ton in '97. The average yield of the 2,786,421 tons crushed has been $3.07 per ton; the average cost per ton, $1.45; the average profit per ton, $1.62. The figures are official and furnish a good example of scientific mining of low grade gold ore at a profit.

THE larger the diameter of the pulleys and drums used the less detrimental bending stresses exerted upon wire rope, but in all cases they should be mounted to run truly in their bearings, otherwise there may be much injurious side friction and mounting of the rope. According to some practises the diameters of the pulleys and drums are never less than ten times the circumference of the rope to work upon them; in others, one foot in their diameter is allowed for each pound of rope per fathom. Scientifically considered, the gauge of the wires used in any winding rope should seldom exceed $\frac{1}{300}$ parts of the diameter of the smallest pulley over which it has to run. The more acute the angles of working, the more flexible should be the type of rope employed. The following may be the approximate depth of shafts at which the weights of wire ropes composed of different materials may equal their working loads or strength: Patent cast steel ropes, 4200 feet; plow steel, 6000 feet. In the majority of cases conical drums with spiral grooves are the best form for winding purposes, and by which fluctuations, in the engines, their speeds and running strains are fairly counterbalanced or compensated. In the case of ropes of ordinary construction, after their weight has been reduced 25% by attrition or wear, the limit of safety or useful duty has been reached. The application of neutral lubricants and preservative compositions at frequent intervals is of importance. Side friction of ropes caused by their being wound or coiled upon drums should be minimized as far as possible, and kinking carefully avoided. If the rope exhibits a tendency to run on the drum from the right to the left hand, the lay of the rope used should be in the same direction, and conversely an opposite lay should be adopted if the rope coils from left to right. Wire ropes should always be stored in dry places and never placed upon the ground without some intermediate source of protection; their uncoiling should be effected from off rotary reels, so as to avoid the liability of injurious kinking. That winding ropes, fastened at one end to cages running in fixed guides and at the opposite end to the engine drums, rotate at work, seems at first thought an impossibility, but upon careful investigation and reflection, that this action will occur will be allowed; indeed, if this were not the case, the ropes would be found to have worn only on one side or in certain local places, whereas winding ropes will be seen to have become uniformly worn all around their circumferences. These revolutions are due to the strands forming a screw-like spiral structure.

How Horseshoes Are Made.

Probably few of our thousands of readers are aware of the large amount of painstaking labor required to produce a horse or mule shoe that will meet the demands of rough travel in the mining regions of this west half of America. Herewith is presented a brief description of the manner in which the Eagle Horseshoe Co., South Milwaukee, Wis., supply the finished product. Their experience is that the quality of iron most suitable for horseshoes is obtained by combining No. 1 wrought forge and old horseshoes, and these are used exclusively in such manufacture by them. After the material is received in the piling department it is selected, cleaned, prepared and treated. The scrap is first piled on boards of convenient size and taken to the large furnaces, heated to a welding heat, then passed to the billet mill, where it is rolled down into billets from 2 to 3 inches square and from 20 to 30 feet long. These heating furnaces are long firebrick structures bound with iron and provided with doors through which the iron is charged and drawn. Crude petroleum is used for fuel and is sprayed into the furnace by steam, producing a flame which fills the interior and brings the firebrick lining to a white heat.

From each furnace, an overhead track leads to the rolling trains, and a large pair of tongs suspended from a trolley is used to convey the white-hot iron to the rolls. The iron after being rolled into billets is passed to a large pair of shears, where it is cut into pieces of the required length for use in the small rolling train for the production of horseshoe bars. After being cut, the billets are taken to another furnace and again heated to the proper temperature, after which they are passed back and forth through the rolls of the small mill until they are reduced to the desired size for a horseshoe bar. In the last pass the bar is creased, the creases found in a finished horseshoe being impressed in the hot iron while passing through the rolls.

The bar thus produced is sheared into horseshoe billets or straight pieces of iron, creased, and of the proper length to be formed into horseshoes.

The creasing rings are turned, bored, faced and milled by machinery and finished by hand. The work requires care, as the misplacement of a nail point by a sixty-fourth of an inch will cause the ring to be rejected.

After being cut the required length the horseshoe billets are taken to the punching machines, where the nail holes are punched in them. The billets are then passed through a burring machine to remove the burrs made by the punches, and piled near the bending machines, each of which is operated in connection with a reheating furnace in which the horseshoe billets are brought to a working heat. They are then fed continuously to the benders, which automatically convert the straight billets into the desired horseshoe shape and swedge the heels.

The horseshoes thus formed are finally passed through a finishing press, where they are properly concaved and given a polished and cleanly appearance, after which they are conveyed to the hot bed for sorting and inspection.

After inspection the shoes are packed in kegs containing 100 pounds and are placed in the warehouse to await shipment or placed in bins conveniently located to enable the manufacturers to put up the shoes in assorted kegs. The shoes in this way are subject to careful inspection, and it is rare that an imperfect shoe is allowed to leave their factory.

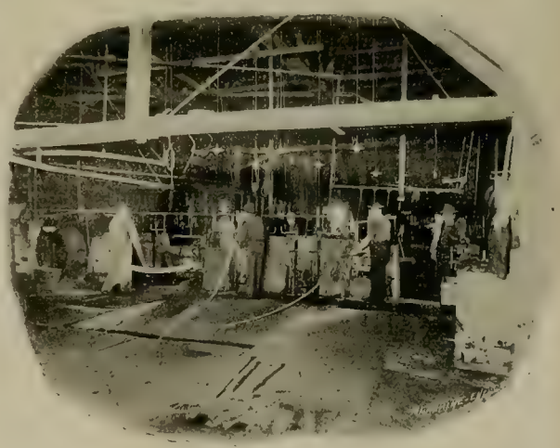
On the Concentration of Ores by the Use of Water.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. TAYLOR.



Notwithstanding the improved modern methods for the extraction of the precious metals from their silicious or other matrix, there yet remains, and always will remain, use for the sizer, the pointed box, the jig, the vanner and the various other devices for the con-

Shearing Billets

Another Furnace.

Rolling Horseshoe Bars.

Shearing Horseshoe Billets.

centration of ores by the use of water. Ores suitable for concentration may be divided into two classes. One class requires coarse crushing in the beginning and final crushing towards the end of the operation. The other class may require to be crushed but once. This paper deals only with the first mentioned class.

As all, or nearly all, the losses in the concentration of ores are in the slimes, it is essential to crush finer than is necessary to free the metal from the waste. The making of slimes is begun in the mine itself. The shot that breaks the ore in the stopes makes slimes, and concentration should be begun then and there. In other words, the clean metal should be picked out and sent on top separately. Of course this hand assorting can be carried too far, to a point where the expense will exceed the profit. The superintendent will necessarily be the judge as to how far to carry this sorting or concentration in the mine.

Again, when the ore from the mine is dumped on the grizzly, the clean pieces of metal, if any, should be thrown to one side instead of through the rock breaker, as, after a piece of metal is clear and free from gangue, to break it again makes slimes and the making of slimes entails loss. Too much stress cannot be laid upon this point, namely, that when a piece of metal, no matter what its size may be, is free from gangue, or, in other words, carries as much value as the concentrates you propose to make, that particular piece of mineral has gone far enough; any further progress through finer degrees of crushing makes slimes.

As to the first crushing, we will suppose that, having been sorted in a mill, and again at the foot of the grizzly, crushing to a cubic inch frees enough of the metal to justify concentration at this stage. I know of no jig or mechanical appliance of any kind which will automatically dress ores of this size; therefore the crushed ore should be passed through a revolving screen or trommel of ¾-inch mesh upon which water is sprayed.

The coarser material which does not pass the screen should be discharged upon a moving belt or table of some kind, where, having been washed by the water sprayed upon it while in the screen, it can be easily and quickly assorted; the rejected portion passing over the end of the table should then be recrushed to the same size as that which passed through the screen, and be added to that product, and the whole passed through a series of revolving screens or trommels for jigging in the usual manner.

Now a word about jigs. A jig, to do its best work, should have a quick down stroke of the piston and a slow recovery. The ordinary eccentric does not give this motion. A blacksmith and carpenter can apply the necessary appliances to produce this motion to any jig, and, contrary to the general belief of concentrator men, it improves the work on fine material as much as on coarse. As to the material for the last, or finest jig, in my opinion 16-mesh should be the limit, as a corrugated belt will do as much work as a jig on material of this size, and do it far better, although I have seen a jig working a 30-mesh product and doing fair work.

Another point I will touch upon here. The discharge for the concentrates off the jig screens should be in the center, as, in that case, you can allow the concentrates to fall into the hutch without disturbing the water level in the jig or the flow of tailings to the crusher below; whereas, with a side discharge, whenever the concentrates on screen are drawn water is also drawn off to that level, the flow is interrupted, and that compartment of the jig ceases to work until filled again with water. This stoppage does not matter much in so far as the jig is concerned, but interferes greatly with your finer concentrating machinery below, for the reasons which will appear later on. One man can fit a half-dozen jig compartments with a center discharge in a day at very small cost.

A Great Dredger.

A double hull suction type dredger, with an hourly capacity of 7000 cubic yards, has recently been constructed by the Societe Cockerill of Belgium for use on the river Volga by an American engineer. The dredger is in two parts so as to pass through the Marie canal en route from the Baltic to the Volga. The double dredger can be operated as a whole, making a bottom cut 62 feet wide, or each half can be operated separately. Each half measures 216 feet by 32½ feet wide and 9 feet deep. At light draught the hull draws 4 feet of water, the working draught being 8 inches greater. The dredger is electrically self-propelling and controllable, the electric installation of each half being a 600-kilowatt generator directly connected to a fore-and-aft triple-expansion engine. The generator supplies two stern motors and two bow motors, each of 125 H. P., driving 41-foot screw propellers. The generators also supply power to the two 30 H. P. motors mounted in the distributing pontoon and arranged to control the position of the pontoon line as required by operations. Lighting is done from a separate installation. Control of all motors is centralized in the pilot house. Quarters are provided for the crew and government engineers on each hull. The pipe pontoons are elliptical air jackets, reversible, and not easily affected by wind, waves or currents. Metal joints are used, as they do not obstruct the discharge stream so much as rubber connections. Each pair of compound cutter engines works four cutters and each main pump can develop 1500 H. P. The tender for this huge plant is a stern-wheel ten-knot steamer.

Each of the two hulls is built entirely of steel, with a 3-inch pipe deck and a light frame deck-house,

Near the bows are recesses for the succession ladders and their bearings, and further back the hull is cut away on each side to provide space for a screw propeller. There are twin screws and rudders. The interior of the hull is divided by transverse bulkheads into water-tight compartments. Throughout the central part of the boat for three-fourths of its length there is a double bottom, which is in turn divided by longitudinal keelsons and water-tight floors into compartments, each of which is provided with an ejector.

The main centrifugal pump runs at 150 to 180 revolutions, and is driven by a divided vertical triple-expansion engine, two of the cylinders being on one side of the pump and two on the other. The engine weighs complete forty-five tons.

The engine for driving the electrical generator is of the usual vertical marine type, triple expansion, three cylinders working on three cranks. A large governor acts on the valve gear of the high-pressure cylinder, regulating the speed. The cutters are driven by a pair of horizontal tandem compound engines placed side by side, with shafts coupled together to quarter cranks.

Dredging for Gold.

Written for the MINING AND SCIENTIFIC PRESS by THEO. F. VAN WAGENEN, E. M.

While it cannot be claimed that gold dredging in the United States has yet attained an established position as an industry, still substantial progress has been made, and there can be no doubt of the ultimate outcome. Of course, with our characteristic energy a very large number of enterprises have been inaugurated upon ground utterly unsuited to this method of mining; many dredgers have been designed and built by men entirely without mechanical ability or experience, and several have been erected to operate ground carrying so little gold per cubic yard that financial success was hopeless from the start. In fact, there are not lacking instances when expensive machines have been set up to dig ground that was entirely innocent of any value whatever in the precious metal. Out of nearly one hundred efforts I cannot now recall a dozen that have become financial successes. Two or three of these are in Montana, one at Idaho City, Idaho, three are on the Snake river, Idaho, and the balance in California. It may be considered, at the first blush, that 10% represents a very small proportion of success against a very large proportion of failure; yet if we examine into the early history of any mechanical industry now a decided success, it will be found to be strewn with as notable a number of wrecks as the one under consideration. For, aside from the inevitably large number of mechanical problems to be solved in the inception of any business involving the use of machinery, incompetent men, dishonest methods, reckless business management and careless speculative investing always take the lead in such enterprises, and the industry does not get upon its feet till the schemers and the frauds have had their day and are pushed to the rear.

No part of the world affords better or more extensive fields for gold dredging than does the western United States. In Australia, on account of the extreme aridity of the country, even in the recognized gold fields, and the fact that this has been the condition of the island continent for untold ages, there are very limited opportunities. New Zealand is better conditioned, but is itself only a small patch of land as compared with our Pacific States. There are many streams in the Urals and in Siberia that have attractive reaches of dredging territory, but capital will hardly go there until the equally good and more accessible fields elsewhere are occupied. South Africa has practically no dredging territory so far as known, and while the interior of South America possesses many openings of the finest kind in this line, the same conditions rule there as in Russia and northern Asia.

In the western United States we have an extraordinarily large field of gold-bearing alluvium in a climatic zone where precipitation is abundant, and doubtless has been for many milleniums. There has resulted, therefore, great erosion of the original auriferous deposits, followed by the collection of gold in a vast number of modern stream beds of all sizes, from the mountain rill to the mighty Columbia. Many of the smaller of these have already been partially, or even wholly, robbed by the pioneers, but in the vast number of cases the grade has been too light to enable the early day miner to do his work with any degree of thoroughness, or the bottom has been so heavily sown with boulders that he could not handle the ground with the crude appliances of his time, or the volume of water has been too great to be controlled. In all these places thousands of tons of the yellow metal are scattered, which, until the advent of the dredger as a mining machine, have been considered to a great extent beyond the reach of human ingenuity, except at a few places where, by reason of favorable topographical features, streams could be diverted and their channels laid bare.

On the other hand, the advent of the dredger has led many too sanguine souls to assume that another one of nature's doors has been not only unlocked, but thrown wide open. There has been over-confidence in the machine, too much generalizing and too little experimentation as to details; too little preliminary sampling of the ground; too much hasty investment of money under the supervision of men of no mechanical training. In fact, the usual unthinking rush to extract profit from a partially developed, new idea. Presumably, the dredger fever must run its course, during which the usual percentage of fatalities will occur. But perhaps the time has arrived when some valuable conclusions may be drawn even from the bodies of the dead, from the scrap piles that already attract attention in so many quarters, and from the

Prospecting Drill Outfit.

ribs of the hulks that lie stranded among the pines in many an upland valley of the West.

The problem of gold recovery by dredging is wholly a mechanical one, exactly as is the case in hydraulic mining. Stated broadly, it consists of lifting the gravel from its site in the stream channel to a height from which it may be dumped into a sluice box and washed. There must be more or less grade to the sluice (2% to 8%), and it must be long enough

Modern Elevator Gold Dredger

not only to allow the gold a proper chance to settle, but to carry the tailings far enough away, so that they will not flow back under the dredger. Three conditions may exist:

First.—The auriferous gravel may be the material lying at the bottom of a stream of sufficient size to float the dredger at all seasons of the year, as is the case in the Snake, Columbia, Klamath and Rogue rivers and elsewhere; or

Second.—It may be the stuff constituting the beds of mountain streams, covered perhaps with 2 to 20 feet of loam, or even more in places where the waters formerly or at present have expanded into a lake or long reaches of still water favorable to the deposition of silt; or possibly hid 10 to 30 feet deep under tailings that have come down from hydraulic mines on the hills on either side; or

Third.—It may be bars or benches by the side of mountain streams, or even rivers of respectable size, representing what at one time has been parts of their channels.

There are infinite variations of these three conditions. But all of them imply a position for the gravel which does not afford a natural dump, so that it must be lifted from its bed. Occasionally circumstances permit this to be done by the direct action of water, as in the various types of hydraulic elevators, when, of course, the dredger is not needed.

The careful engineer, when called upon to report on the advisability or otherwise of a proposed dredging enterprise, should furnish his clients with definite and thorough information upon the following subjects: Average value of the deposit per cubic yard from top to bottom, as determined by numerous vertical sections from surface to bedrock; and profiles of the bedrock from rim to rim, and of the various strata that rest upon it, with detailed statements as to the comparative value of each strata; the whole supplemented by maps from which may be calculated the cubical contents in payable material of the entire property. In addition to this the examiner should ascertain the material of which the bedrock is composed; the nature of its surface—whether smooth, rugged, soft, hard, even or fractured; the average or maximum size of the boulders, and whether they are rounded or angular; and whether the gravel immediately on the bedrock is cemented or loose. The maximum, minimum and average flow of water in the channel should be carefully observed, the climate of the locality investigated, and a considerable quantity of the the gravel (50 to 100 tons) obtained in small quantities from a large number of places on the ground, from surface to bedrock, and combined, should be first grizzled to separate all boulders over 4 inches in diameter, then carefully sluiced down to black sand. The boulders should be corded up and measured; the black sand also, and the proportion of each to the original mass taken accurately calculated. If there is any notable quantity of loam or clay seams, their probable proportion to the whole mass should be estimated, and if the ground has been worked over in the early days by the miner account should be taken of the old drains, wing dams, levees, shafts, drifts, boulder piles, etc., which he has left behind and which have since been covered by tailings or other workings, for all of these will act as snags in a river bed and, aside frow showing that the ground is more or less robbed, will, when encountered, subject the digging machinery to severe strain. If a piece of ground is well prospected or sampled, all these extraneous features can be so accurately located that a very valuable map of the deposit can be made.

It is a business crime either to buy a piece of dredging ground, or to design a machine to work it, until thorough sampling and prospecting has been done. The question is how to do it effectively and at the least cost. Without it the enterprise is one of extreme hazard. With it the business can be made as certain as farming.

In a very few cases where the deposit is very shallow (5 to 10 feet) and there is little or no underground flow of water, prospecting can be done by shafts, which will cost from $10 to $50 apiece. But in the vast majority of cases these conditions are absent, and pits will cost from $500 to $5000 each, and are often entirely impracticable. The sinking of caissons, either of wood or iron, is an absurdity. Any one of the freezing methods could at times be advantageously employed but for the heavy royalties demanded by the patentees. But the drilling system is, by long odds, the simplest, cheapest and quickest, and it has been proven by experience to yield very accurate results if enough holes are bored and if the machine is carefully worked. Several good machines are on the market, costing from $500 to $3000 each. It should be stated that as yet the manufacturers do not thoroughly understand the work required, and, as a consequence, the standard "outfits" include a great deal of stuff that is wholly unnecessary and lack some appliances that are highly desirable. My preference, after trying several makes, is for an extremely light machine driven by horse power and weighing, all told, less than 1000 pounds. This, when knocked down, with its heaviest part not over 300 pounds, can be transported with ease on skids over snow, sand, water, boulder piles, marsh or roads. The steam power traction drills are entirely too cumbersome for the work. It is true, they can sink a hole quicker when set up, and can move rapidly from point to point on level and solid ground, but, as we all know, dredging propositions are not built that way.

The essentials are: (1) Extra heavy drive pipe, 6 to 10 inches diameter, provided with long, thin couplings, carefully threaded and fitted to the threads on the pipe, so that the ends of the latter abut. These ends should be squared and planed accurately, so that the couplings will have no part in transmitting the force of the blow given by the drive weight. (2) A heavy steel drive head, well shouldered on the pipe. (3) A best quality steel drive shoe. (4) A rig so constructed, with guides for the pipe that it must

go down vertically. (5) A drive weight that cannot fail to strike a fair blow; and (6) a common sense sand pump. These, properly put together and operated by a stout, well-fed horse, with a small boy attachment to keep the horse going, will do wonders.

The pipe should be in 6-foot lengths, and a total of 50 feet will go through a long campaign. There should, of course, be extra shoes and heads, three or four stout chain tongs, a couple of thick, heavy-set jackscrews, and an attachment for operating the sand pump by the power. The drill should be a solid bar, 12 to 15 feet long, 3 to 4 inches diameter, and with detachable bit. A few extra bits should be provided, and they should just fit comfortably inside the pipe with reasonable clearance. The outside diameter of the sand pump should be 1½ inches less than the inside diameter of the pipes, so as to leave ¾-inch clearance all around. The valve should be a couple of inches above the bottom of it. At the top is a rigid bale, to which is attached a link as long as the pump, whose length will be about 3½ feet. It is well to have the pipe couplings rounded on the edges. Every length of pipe, as attached, should be well brushed all around with some thick, semi-fluid grease. Then, if the pipe goes down straight, there will be no trouble in withdrawing.

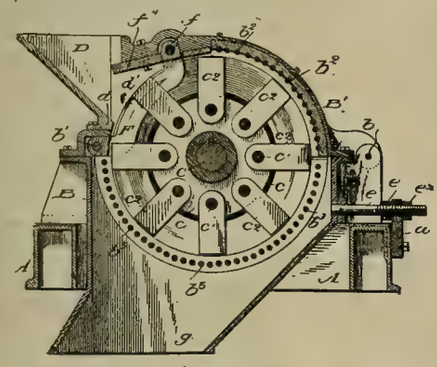
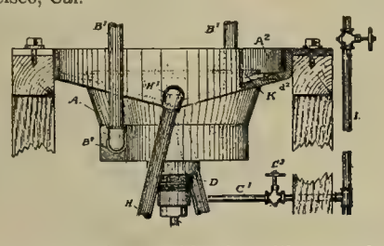
Latest Mining and Metallurgical Patents.

Patents Issued Jan. 16, 1899.



Specially Reported for the MINING AND SCIENTIFIC PRESS.

PROCESS OF REDUCING METALLIC ORES.—No. 641,270; C. G. Collins, New York, N. Y.

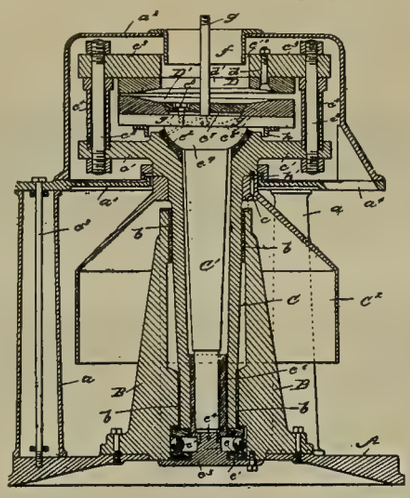


A process of preparing ores for the extraction of metal which consists in mixing the powdered ore with a powdered fluoride and subjecting the mixture to a temperature below the fusion point in the presence of hydrogen gas.

CRUSHING MILL OR DISINTEGRATOR.—No. 641,346; T. L. Sturtevant, Quincy, and T. J. Sturtevant, Newton, Mass.

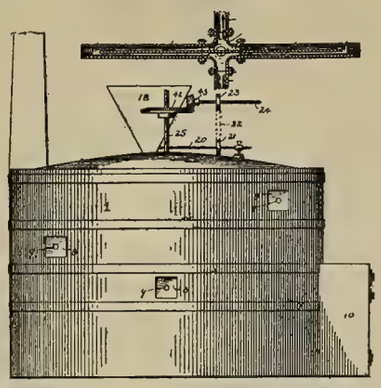
A crushing mill, combination with pivoted revolving beaters or hammers, of a casing provided with a hopper, grate fixed relative to casing and interposed between chamber of hopper and chamber of casing, the mill having an outwardly flaring and inwardly contracted grate chamber between the hopper chamber and casing chamber, pivoted revolving beaters or hammers within the casing chamber and arranged to extend between and through the bars of the grate, with means for adjusting casing and grate to cause the beaters or hammers to project more or less through the bars of the grate.

ORE SEPARATOR.—No. 641,359; J. Barron, San Francisco, Cal.



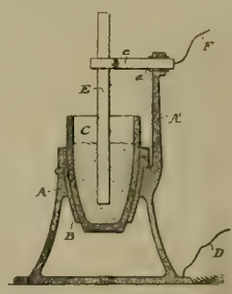
An ore separator, combination with a pan having an outlet over the rim, a tangential inlet at the bottom of pan, a standing hollow cone at center having a series of flat radial abutments with openings beneath level of bottom of pan; a channel surrounding base of cone opposite its openings and having apertured top and bottom walls, a collecting channel below lower apertures communicating with discharge passage, and a source of supply of clear water under pressure to interior of cone and out its openings into the channel.

ELECTRIC AMALGAMATOR.—No. 641,360; L. H. Barricks, San Francisco, Cal.



An electric amalgamator including a metallic frame or body having perforated plate secured to its bottom, porous plate resting upon metal plate and forming bottom upon which mercury is placed, pan or box upon which frame or body is supported, adapted to contain saline solution, sluice connecting with frame above porous plate, and having copper plate in its bottom dipping into mercury and serving as negative pole of electric circuit, and plate in pan or box serving as positive pole of said circuit.

CRUSHING MILL.—No. 641,654; T. L. Sturtevant, Quincy, and T. J. Sturtevant, Framingham, Mass., assignors to the Sturtevant Mill Company, of Maine.



A crushing machine, combination with two rotating crushing disks tilted or inclined relative to each other, two rotating shafts with which disks are rigidly connected and which shafts extend in the same direction from disks, shafts rotating on different axes, one disk being provided with an eye or opening for the passage of the material to be crushed, and both disks having their adjacent faces recessed or cut away for the reception of material between them, combined with means for rotating them so that portions of their proximate faces are continuously approaching while other portions are constantly receding from each other; thereby crushing the material and then discharging the crushed material by centrifugal action.

FURNACE FOR ROASTING AND REDUCING ORES.—No. 641,460; H. B. Meech, Denver, Colo.

A cylindrical roasting furnace with two or more ovens one above the other, each having an opening in the bottom or bed thereof, a flanged discharge wheel located in each opening mechanism for rotating discharge wheel, in combination with hollow vertical shaft in sections, jointed together by center pieces, having horizontal arms fast thereto, center pieces and arms each interiorly divided into two chambers by a horizontal partition therein, and mechanism for rotating shaft.

PROCESS OF AGGLOMERATING COMMINUTED ORES OR CONCENTRATES.—No. 641,552; M. Ruthenburg, Philadelphia, Pa.

In assembling a mass of independent particles of ore or concentrate, in the path of an electrical current, subjecting it to the action of an electrical current, until the contiguous corners of its component particles cohere, and terminating the action of electric current, while the coherent body, thus produced, is of open, porous structure.

PROCESS OF EXTRACTING GOLD OR OTHER METALS FROM REFRACTORY ORES.—No. 641,652; A. G. Stephens, Los Angeles, Cal.

A composition for the extraction of gold and other metals, composed of water, chloride of lime, muriatic acid, nitric acid, bromide of potassium, and chloride of sodium, to be varied according to the refractory conditions of the ores treated.

Mining and Metallurgical Section of the Franklin Institute.

TO THE EDITOR:—The Mining and Metallurgical Section held its stated monthly meeting on Wednesday evening, Jan. 10th. The following officers were elected to serve during the year 1900: Joseph Richards, President; A. E. Outerbridge, Jr., Vice-President; Dr. David K. Tuttle, Vice-President; G. H. Clamer, Secretary; Dr. Wm. H. Wahl, Conservator.

Prof. F. Lynwood Garrison read a paper on "The Lead and Zinc Mines of Southwestern Missouri." These mines are in the locality known as the Joplin district, and it is the belief of Prof. Garrison that this region is destined to become the greatest zinc producing district in the world. Speculators are spending vast sums of money there at the present time—during 1899 it being estimated that $40,000,000 were expended in the development of the mines. We are, however, much surprised to learn that the increased output has only been 9% for 1899 over 1898, while 1898 showed 29% increase over 1897, and 1897 showed 23% increase over 1896.

It is quite unaccountable why last year should show such a relatively small increase and the two previous years so marked an increase, when we consider the vast sums expended in 1899 and the high price of ore.

The value of the district's production amounted to nearly $11,000,000, and the cost of production about $8,000,000, leaving a small amount out of which to pay dividends on such large capitalizations.

Prof. Garrison's paper was well illustrated by slides and specimens. G. H. CLAMER, Sec'y.

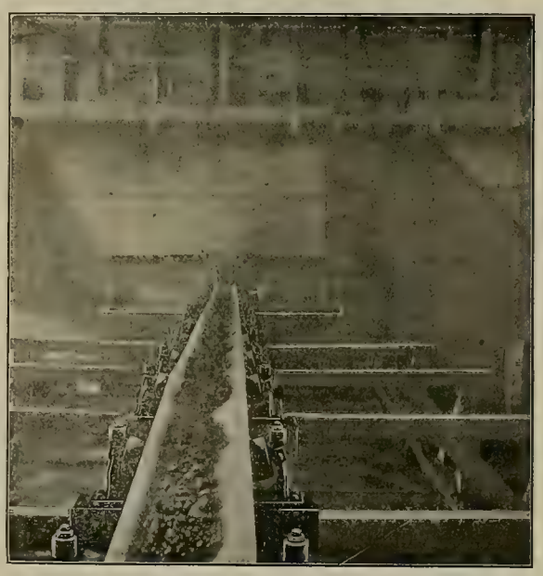
ONE of the latest triumphs in the engineering world consists in the construction, shipment by steamer and subsequent transfer to railway transportation of a steamer of 4200 tons displacement, which was finally put afloat in Lake Baikal, Siberia, not less than 5000 miles from St. Petersburg.

The Formation of Coal.

Carbon is the principal element in the composition of coal. A good specimen of hard, dry anthracite has 95% carbon. Average anthracite would show from 85% to 90%; bituminous and semi-bituminous varieties would range all the way from 50% to 85%. The amount of volatile matter contained increases from 3% in the anthracites to 38% in the bituminous species. The conduct of these different kinds of coal in combustion gives practical emphasis to the difference in composition. The anthracites burn with a small blue flame of carbonic oxide until thoroughly ignited, give off no smoke, and leave a comparatively small percentage of ashes. The bituminous class, on the other hand, burn with a continuous yellowish flame, give off considerable smoke and leave a large percentage of ashes.

That coal is a vegetable product may be specifically proved. While to the naked eye the structure of a fragment of mineral coal is purely amorphous, yet if that fragment be made so thin that it will transmit light, and if it be then examined through a powerful microscope, its vegetable structure will be readily distinguished. Heat, pressure and confinement have produced the transformation. It is simply a process of smothered combustion. The operation may be watched in any peat bog. A peat bed is an accumulation of the remains of plants which have grown and decayed, and have been, year by year, buried more deeply under succeeding growths. Remove the upper layer, and one finds peat, with its 52% to 66% of carbon. The deeper, that is, the older and longer buried the product, the better its quality for fuel. If this process of deposition should continue through many geologic ages, the result would be true coal.

During the Carboniferous age the area now covered by the Mississippi valley was little more than a vast marsh burdened with the most luxuriant vegetation. The conditions were all favorable for the rapid and enormous growth of plants. The soil was rich and moist. The heat was greater than exists to-day at the torrid zone. The humidity of the atmosphere was great and constant. The air was laden with carbon. Plants luxuriated in it. They grew to enormous sizes. Plants which in our day are mere stems, a fraction of an inch in diameter, were in that time represented by trees from 1 to 3 feet in diameter and from 40 to 100 feet in height. This mass of vegetation, including more than 500 different species, was constantly growing, falling and decaying, each succeeding growth forming a still richer bed for the vegetation to follow.



If the theory propounded by Laplace be correct, our earth was at one time a ball of liquid fire. Cooling and condensation progressed from the surface toward the center. Contraction of the earth's crust necessarily followed, and vast areas of land sank and were covered by the waters. This process was still going on during the Carboniferous age. The submergence of a bed of this incipient coal meant the cessation, for a time, of vegetable growth from its surface. That surface was covered instead by the sand, mud and gravel washed over it by the waves, by the drift from higher levels and by the limestone deposits swept up to it from the sea. When contraction ceased for a time and the earth's crust again became stable, the waters began to recede, leaving behind them great wastes of mud and sand. And, following this slow recession to the sea, vegetation crept once more over the surface of the land, the soil grew rich with the products of decay, and plant life reigned and rioted anew. But cooling and contraction of the earth's body were going continuously on, and submergence followed again and again, each bed of vegetable matter, thick or shallow, being covered in turn by its layers of sand and silt.

In this submergence and burial of the deposits of the coal era is found all the conditions necessary for the transformation of vegetable matter into coal. Only from one-ninth to one-sixteenth of the mass of vegetable matter subjected to this heat and pressure was retained in the form of coal. This was largely carbon, the hydrogen and oxygen having been expelled. The anthracite coal contains a much larger percentage of carbon than the bituminous, and a much less quantity of volatile matter. Of the immense coal areas in the United States only an extremely small percentage are of the anthracite variety, and these all lie in the State of Pennsylvania, east of the Allegheny mountains, with the exception of a small field in Rhode Island. It is not thought that the vegetable life which entered into one class differed in any material respect from that which entered into the other.

The presumption is natural, if not conclusive, that prior to the close of the Carboniferous age all the coal deposits had been bituminous in character, but that the violent movement of the earth's crust at the time of the Appalachian revolution, the enormous pressure and intense heat, were sufficient to expel a large portion of the volatile matter from the bituminous coal beds, and otherwise change thein character into what we now class as anthracite. In the slate strata immediately overlying each coal seam, it is common to find the impressions of twigs, nuts, seeds, leaves, delicate fern tracery, and the trunks of great trees smashed flat between the layers; while in the softer beds of cannel coal whole trees have been found, roots, trunks, branches, leaves, seeds, and all transformed into like material with that by which they were surrounded. One of the results of the violent disturbances of the earth's crust already noted was to leave great rents in it across the lines of strata. These rents are known geologically as fissures. They have faces which are either parallel or inclose a wedge-shaped cavity. Sometimes igneous rock from the molten mass below was forced up into these openings; sometimes the cavities were filled with drift and rock fragments from the surface. In either case the mass became hard and compact, but with a character materially different from the rock on either side, the formation of which was contemporaneous with that of the coal. The mind must exert itself to the utmost in order to fully realize through what vast periods of time the processes were continued by which the coal of to-day was formed.

Jeffrey Century Belt Conveyer.

The accompanying illustration shows the Jeffrey Century belt conveyer as used in the plant of the De Lamar mines of Mercur, Utah. This is one of several conveyers of various dimensions used by this company for handling ore. The Jeffrey Century belt conveyer is especially designed for the handling of all abrasive material, which should be carried rather than scraped, to avoid excessive wear. The principal features of the Century belt conveyer are: First, the belting: a special grade having its carrying side re-enforced with an entra thickness of rubber of a special composition, which effectually resists the cutting tendency of the material and greatly prolongs the life of the belt; an ordinary rubber belt would not be satisfactory for this class of work. Second, the carrying idlers, which consist of special stands and pulleys; the latter, running on self-lubricating pulleys, require oiling only at long intervals. The pulleys are set so as to give the belt the shape of a trough, thus concentrating the material in the center of the belt and keeping it from spilling over the sides.

Jeffrey Century Belt Conveyer.

These conveyers are manufactured by the Jeffrey Manufacturing Company, Columbus, Ohio, in all lengths and sizes for various duties, and any one desiring special information and prices should write for catalogue and full particulars.

Properties and Characteristics of Clay.

The properties and characteristics of clay depend upon, first, the kaolin minerals, and second, the impurities. In the case of the former, the conditions in which their fragments are found is important; that is, whether their individual particles consist of prismatic crystals, minute plates or thin cleavage scales, resulting from either the simplest form of disintegration of the original crystal, such as is brought about by the action of the frost, or from abrasion, suffered during transportation from its place of origin to its home, as a sedimentary deposit. In the case of the impurities, much depends upon both the absolute and the relative quantities of each present, and its state of fineness or subdivision.

Clays are characterized by no special color. The pure variety is white; but they commonly occur gray, drab and bluish, often mottled and variegated. They are also found of almost all colors, frequently being brilliantly tinted with reds, yellows and purples. Organic stains give a variety of colors, often brilliant in hue, purple and red being the most striking. Different compounds of iron, the most common coloring causes, give greenish, gray, yellow, brown and red tints. The colors are deepest when the clay is moist, and they grow lighter as the clay is dried.

The colors effect the use of the clay in its raw state; as, for example, its use in the manufacture of wall papers, the adulteration of foods, etc.

In most cases its color, in the natural state, enables one to confer the color of the burned product. Organic stains, however, disappear on burning, while the iron stains are modified or developed by both the intensity of the heat employed, and the degree of oxidation effected in the process of burning.

Clays are usually characterized by a peculiar odor or argillaceous smell, which is not invariable, and by a smooth, unctuous feel, which is also frequently absent, being dependent upon the fineness of grain and the absence of coarse impurities or grit.

In density, hardness, tenacity, etc., clays differ widely, being modified in these particulars by their geological history. Among the crystalline rocks, where they originate, they are apt to be coarse and loosely adherent, but often transportation and secondary changes which they may have undergone, following their accumulation as sediment, such as compression, the loss of water, infiltration of mineral matter, etc., etc., changes their general structure widely. They vary from soft, porous, incoherent masses, through tough, compact varieties, which are often laminated or have a fissile structure, on to exceedingly tough, and even to varieties which are so hard that splinters flying from beneath the blow of a heavy hammer will cut the flesh of a workman. Such clays belong to the class known as flint clays, and are mined only by drilling or blasting. The degree of hardness varies, in the scale of 10 used by mineralogists, from 1 to 3.5; but this is hardness of the clay mass technically a rock, and not that of the individual clay or kaolinite particles, the hardness of which has not been accurately determined, owing to their extreme smallness.

The specific gravities range from less than 1 to about 2.5, pure kaolinite having a specific gravity of 2.60. The specific gravity varies with the state of compactness of the mass. A clay found in Georgia will float for a time in water, and when coated with a thin film of paraffine it floats like a cork.

The Properties of Some New Alloys.

This was the caption of an address recently delivered by A. E. Tucker, in which he pointed out instances of change in alloys due to external action and internal causes, and described a nickel aluminum alloy containing 4% of nickel, which, in a few hours after being cast, fell to powder at ordinary temperatures, an extraordinary result when the toughness and malleability of the separate metals was regarded. The effect of bismuth on copper and brass was also referred to, and he said that the matte might be summed up in a general statement that, given the properties of a definite alloy, the effects of introducing even a trace of a foreign substance into it could not be foretold by any reasoning from analogy. The past masters of metallurgical art, the Japanese, had only reached their skill by generations of intelligent plodding, and often baffled us, with all our science, in the discovery of their methods. He alluded to the application of metallic aluminum as a means of producing the rarer metals in a pure form, which process seemed likely to replace the more complex apparatus of the electric furnace. Steel has recently been produced by melting hematite pig with steel scrap, and adding to the natural hardness of the mixture so obtained by a judicious addition of manganese-tungsten alloy, the solidity of the ingots being insured by adding aluminum nickel. He said that it would be apparent, bearing in mind the number of metals at present at practical disposal, that an infinite field of research is open, and one in which the reward to the worker is great. The amazing variation of properties caused by a slight change in alloy composition has long been known, and as the number of metals available for alloying steel are large the possible combinations are practically infinite.

Popular and Trustworthy.

The MINING AND SCIENTIFIC PRESS of San Francisco has begun its 80th half-yearly volume, and is greatly improved in appearance by the addition of clear new type. The MINING AND SCIENTIFIC PRESS is standard authority for correct mining news, and has no superior anywhere as a popular and trustworthy journal in the line of mining information. We extend good wishes for its continued prosperity.—Yreka, Cal., Journal, Jan 19.

MINING SUMMARY.

ARIZONA.

MARICOPA COUNTY.

(Special Correspondence).—Phœnix was founded in '70, and in '71 had an American population of seventy-five men and one woman. Its present population is 12,000 or 15,000. It is centered in a valley of 300,000 acres of fruitful land, and needs a storage reservoir system and internal railway intercommunication, both of which are under way.

In the Salt River valley the Hudson Reservoir Co. (a private corporation consisting of New York men) has begun operations sixty-five miles above Phœnix, below where Tonto creek and Salt river meet, to construct a dam, arrow-shaped, dam site 201 feet wide at water level in hard rock, with bedrock 25 feet deep, to impound water one and one-half miles wide, twenty-four miles long, average depth 80 feet. This, it is expected, will furnish all the water necessary for the 300,000 acres of land in the Salt River valley. An expenditure of $2,000,000 on this problem is anticipated, without government aid. Gov. Murphy says he favors government aid in the construction of reservoirs and in the cession of government lands absolutely and without restriction.

Equally important with the question of water storage is railway transportation. Arizona needs more railroads and an independent outlet. This can be obtained at the headwaters of the Gulf of California. The material prosperity of Colorado began with the introduction of narrow-gauge railways, which penetrated into every mining camp. The same thing will occur in Arizona. A company has been organized embracing a narrow-gauge railway system, having its center in Phœnix, and branching out as far east as Ray, Riverside, Globe, the timber region of the Tonto basin, Clifton, Morenci and reaching Flagstaff on the Santa Fe system. North of here it goes to Castle Creek, Big Bug, Prescott, Jerome and other points throughout the mountain region. Southwest it will touch a point at the head of the Gulf of California, only 183 miles distant from here. This narrow-gauge system can be built at a minimum of expense; and, if connected with the Denver, Rio Grande & Western, would make a new route from Denver.

Phœnix, Jan. 22.

PIMA COUNTY.

(Special Correspondence).—J. P. Camou, Guaymas, and his son-in-law, A. Morales, are in Phœnix closing a deal for the San Rafael del Valle grant, 75,000 acres. The San Rafael grant lies along the San Pedro river north of Nogales, and has for some years been occupied by the Packard Cattle Co.

Guaymas, Jan. 9.

YAVAPAI COUNTY.

(Special Correspondence).—T. E. Farish, Mgr. Whipsaw Copper Mines Co., in Castle Creek district, sixty miles from Phœnix, has fifty men employed in development work. The shaft is 165 feet deep. A 400-foot tunnel is in ore 3 feet wide, carrying 10% copper and $10 in gold. Drifts are being run both ways from the tunnel. The veins are iron-capped in a schist formation. A sixty-ton water-jacket furnace is being built to treat the carbonates and oxides. It is a close corporation, the capital being furnished by Col. Christy of Phœnix and New York parties.

Castle Creek, Jan. 20.

Jerome hears that another large copper smelter is to be built there by the United Verde Ex. M. Co. The company has begun the construction of a pipe line to the proposed smelter site.

CALIFORNIA.

Gov. Gage has called an extra session of the Legislature, to convene at Sacramento on the 29th inst. Among other business, he wants the Legislature to "consider and pass and re-enact the law repealing the Act of the Legislature, which was approved March 27, 1897, concerning the manner of locating mining claims upon the public domains of the United States."

AMADOR COUNTY.

The Valparaiso Mining Co. has incorporated at Jackson. Directors—D. Boro, W. F. Detert, A. Ginocchio, E. Ginocchio and G. Poggi; capital stock, $25,000, subscribed.

CALAVERAS COUNTY.

The Gold Hill Mining Co. will forfeit its incorporation charter in the State of Illinois and incorporate under the California laws that the stock company can be assessed to further the development of the mine at Smith's Flat. The company had intended to put up steam machinery on the Osborne-Truax mine at Smith's Flat, but have concluded to sink a two-compartment shaft 100 feet deep.

FRESNO COUNTY.

Work has been begun on the reservoir of the San Joaquin Electric Co. in Crane valley. There will be an artificial lake two miles long with enough water to supply power during dry seasons.

Following is a letter from Congressman Needham to the Petroleum Miners' Co-operative Association: "I beg leave to acknowledge receipt of a petition of the Petroleum Miners' Association, with affidavits, circulars, etc. I have presented the petition and papers to the Interior Department for its consideration and the same have been filed. I suggest, however, that whenever a location by script or otherwise is placed upon an oil claim that the oil claimant immediately file with the department affidavits showing that the claim is more valuable for mineral than for agricultural purposes, and also evidence going to show fraudulent filing upon the claim by those other than the mineral claimant, and giving description of the claim by township, range and division of the section. The department here claims that while there is a blanket affidavit tending to show that this whole region is oil-bearing, still it would not be legal to hold that it is all oil-bearing and none of it agricultural in character. The blanket affidavit and petition, circulars, etc., are valuable to inform the department of the situation, still they are not sufficient legally to protect the rights of oil claimants in the oil region. I feel warranted in saying that if every oil claimant will inform the department as soon as an agricultural filing is made covering the same piece of land and proof by affidavits is filed, showing that the land is more valuable for mineral than agricultural purposes, that the rights of all parties will be thoroughly investigated and protected.

KERN COUNTY.

At McKittrick oil fields in the big well the 9⅝-inch casing is securely capped, the two escape pipes being supplied with stopcocks, one of which is opened ½ of an inch to relieve the pressure. Through this opening 100 barrels of oil pours daily into tanks. The pipe line to McKittrick is to be completed.

MADERA COUNTY.

The California Copper Co. reports a vein of copper. The company's smelter will be started up soon. The smelter is located at Madera. Assays show an average grade of 17% for 26 feet width. The Southern Pacific is laying 6000 feet of track, connecting the mine with the railway, and the work is expected to be completed next week.

MARIPOSA COUNTY.

J. H. Galey has the Murphy mine bonded and is doing development work. The Gazette hears that Supt. Gilbert of the Virginia mine will soon be on the ground to commence operations. Drawn & Co., managers of the Longfellow mine near Big Oak Flat, are inspecting the old Red Cloud mine.

The Quail mine on Indian Gulch has changed hands and names. The company to whom it was bonded made a sale and changed its name to Hartford.

T. P. Bisland is the Supt. of the Nameless mine, once called the Bonanza.

The Columbia Mining Co. has finished the dam on Maxwell's creek, near the Tyro mine, and began work on their property. A ditch a mile and three-quarters in length will convey the water to the mill, where it will have over 600 feet pressure.

MERCED COUNTY.

The Merced Oil & Mining Co. has incorporated at Merced; capital stock, $100,000, subscribed $3500; C. H. Castle, M. D. Wood, A. Harris, E. C. Mason, S. C. Cornell.

NEVADA COUNTY.

The Comet mine, on Osborn hill, near Grass Valley, has been bonded by Broughton & Shovell, from Butte City, Mont.

Construction of the dam across the Truckee river, near Floriston, for account of the Truckee River General Electric Co., progresses. The officers say that the plant will be in operation next July.

The Mountaineer mine is reported in good ore. Ten of the mill stamps are dropping.

ORANGE COUNTY.

The Santa Ana Bulletin says that a rich copper field is discovered at the junction of San Diego, Orange and Riverside counties, a part of the field being in each county; prospect work has been done on 150 claims. Assays show an average of 17%. The larger part of the claims are in Orange county. There is one Mexican claim in the 150, which belongs to M. Lopez, of Capistrano, who has refused to sell.

PLACER COUNTY.

At Forest Hill the Mayflower hydraulic mine, which was shut down for a week, has resumed:

The Bath mine is now paying and additional men have been put to work.

PLUMAS COUNTY.

Near Spanish Ranch the Quincy Mining & Water Co. is actively operating the Bean Hill mine.

SAN BERNARDINO COUNTY.

The boracic acid factory of the Columbia M. & C. Co., at Daggett, approaches completion. There will be fifty-two tanks, each of 5000 gallons capacity.

SAN DIEGO COUNTY.

At Julian the Owens mine has twenty-five men at work. All the ore is being taken out that the mill can handle. Development work is being pushed on the Kentuck S mine at Banner. A shaft is being sunk in the Ready Relief mine by Bailey Bros.

J. Moore of Arizona has bought a prospect adjoining the Shenandoah mine, at Mesa Grande. He has been hauling the ore to Banner, a distance of twenty miles, but will use the Shenandoah mill.

SHASTA COUNTY.

(Special Correspondence).—The Black Spider mine near Keswick, upon which a San Francisco Co. recently placed machinery, has been successfully unwatered and sinking is in progress. An ore shipment has already been made to the Keswick smelter since the work began. Last week J. E. Isaacs secured an option on the Stowell group of copper claims, which he assigned to the Iron Mt. Investment Co., which is affiliated with the Mt. Copper Co. Work under the stipulation of the option is already in contemplation for immediate action. The group comprises 128 acres of patented land and seven locations. The price is $125,000. The property lies between the Iron Mt. and Balakalala mines.

Work continues under the new bond made to W. A. Temple on the Mammoth group of copper claims near Kennett. A representative of the Halifax, N. S., Co., for whom this property and the Balakalala were secured, is in Redding securing options on contagious copper claims.

On the Own group of copper claims, secured by F. G. King, work was begun last week. The property is near Copley.

Your correspondent is reliably informed that preliminary work will begin within two months on a smelter for the Bully Hill copper mines, owned by J. R. De Lamar.

The Pacific M. & D. Co., of Redding, has secured an option on a section of undeveloped copper lands near Copper City, and also on eight partially developed claims near Stillwater.

Redding, Jan. 22.

W. S. Beale of Bakersfield and D. F. Barber of the General Electric Co. of San Francisco are investigating a plan of C. W. Waller for a power plant to supply the mining districts of the county. The location favored by Mr. Waller is on the Pit river, near Bass' ferry, fifteen miles from Redding, close to the Black Diamond copper mine. An 8000 H. P. plant, a concrete dam across the Pit, etc., cost nearly $350,000, is contemplated.

The Iron Mountain Investment Co. has bonded the Stowel and the Lew Waters groups of copper and gold mines. The purchase price named in the bond is $125,000, payable $12,500 at the Bank of California in Redding, and $112,500 at the Commercial Bank of Chicago, Ill., at the expiration of the bond, Nov. 16, 1900. It obligates the Iron Mountain Investment Co. to put twenty men at work within thirty days from Jan. 16th and to keep at least that number employed during the life of the bond.

SIERRA COUNTY.

James Ross goes to the Magnolia gravel mine near Forest City, which will be worked all winter.

SISKIYOU COUNTY.

Journal: The Dwinnell group of mines recently purchased by C. H. Souther, Boston, Mass., is situated about eight miles from Gazelle, at an elevation of 5000 feet. The vein is tapped endwise for a distance of 250 feet, by a tunnel on the mountain side about 170 feet below the croppings. A lower tunnel has been driven since December 1st to a distance of 140 feet, tapping the vein 105 feet below the first tunnel. It is intended to build a road to Gazelle and prepare for ore shipments the coming season.

The miners of Little Humbug have a good supply of water this winter and are doing well.

TRINITY COUNTY.

(Special Correspondence). — There is present activity in quartz mining here. Some of our placer miners are turning their attention to quartz. Several new discoveries and locations have been made since Jan. 1st. The greatest drawback to quartz mining here has been that few prospectors stopped to look at our hills and gulches as most of them were Coffee creek bound. Three years ago Coffee creek was as little talked of as is our locality here, and while it is a demonstrated fact now that Coffee creek regions have opened up many good veins and lodes, we are demonstrating the fact that we have some good ledges and pockets here. The Keno and Five Pines quartz mines, owned by H. J. Van Ness, are developing into good properties. The Catherine quartz mine, owned by Thrasher & Co., is also turning out well.

Almost all the prospectors here are ordinary miners, working on their own capital—chiefly muscle. Could capitalists be induced to grubstake a few some paying ledges would be opened up. This is principally a pocket country. Several nice pockets have been taken out already, and there are thousands of acres here that have hardly been looked over; much of the land is railroad property.

Bragdon, Jan. 22.

The Bullychoop and Occidental mines will have new machinery.

TUOLUMNE COUNTY.

(Special Correspondence).—Your correspondent began his inspection of mines on the Mother Lode at the Rawhide, two miles from Jamestown. The 40-stamp mill is run by electric power, supplied by the Tuolumne Water & Power Co. It has been in operation fourteen months and succeeds a private electric plant operated by the Rawhide Co. It is considered better to have the electric transmission attended to by men trained to that work than to entrust it to even the best workmen around a mine. The mill reduces from 125 to 130 tons of ore per day; it all goes through the mill. The ledge is 20 feet wide. There are large ore reserves yet untouched. The sulphurets are sent to Selby's. Steam power is used for the hoist and pumps. Of the latter, there are three at different levels, each having a lift of about 400 feet, throwing about two-thirds of its capacity, or 200 gallons per minute, each twenty-four hours. A depth of 1700 feet has been reached in the Rawhide. Seventy men are employed. Chas. Jacobs is foreman of the mine; F. R. Cullers has general charge of the mill, both here and at the App mine, which is under the same management, Nevills & Martin being the owners of both properties.

At the App mine, at Quartz, there is a 20-stamp mill, run by electric power. Here the hoist is run by water. The App has a substantial equipment and is characterized by the same features of solidity and excellence which mark the Rawhide; 40 H. P. is required for the batteries, 40 H. P. for the air compressors and 30 H. P. for the rock crushers and blowers. Both water and electric power are supplied by the Tuolumne Water & Power Co. The App is a comparatively dry mine, what water accumulates being hoisted in skips. A depth of 1000 feet has been attained and large ore bodies have been opened, there being three shoots, each from 40 to 60 feet wide. Thirty men are employed. W. H. Schmall is foreman.

The Dutch mine is located on the edge of the town of Quartz and hardly a stone's throw from the App. The stamps and air compressors are run by steam, but it is in contemplation to substitute electric power for the entire works. There is a neat appearance about the Dutch mine, showing efficient superintendency. The mill contains twenty stamps, and below is stationed a Gates plant for saving sulphurets. The latter are shipped to the Selby Co. From a prospect the Dutch gives promise of developing into a good mine. A barren zone has been passed through and good ore is being taken out of the 1100-foot level. Fifty-five men are employed, with A. Trittenbach as Supt.

The Santa Ysabel, a short distance south of the App, and near Stent, is completing a modern and effective equipment. In the main it will be an electric plant, but will be able, in a contingency, to resort to water. It has a private electric plant, which supplements the power obtained from the Tuolumne Water and Power Co. Twenty stamps are being added to the present equipment, making forty. A gallows-frame or headgear 80 feet high is ready for the new hoist. A 200 H. P. double-drum electric hoist, duplicate of that supplied by the Union Iron Works for the Empire mine, Grass Valley, is in position. A fine air compressor, set in cement extending to bedrock, is run by a 100 H. P. alternating motor. The entire new plant will be in operation next month. The shaft at the Santa Ysabel is 800 feet deep; ore is being extracted from the 600 level. There is hardly any water in the mine below the 200 level, from whence it is pumped. The mine and buildings are lighted throughout by electricity. Sixty men are employed; E. A. Hardy is Supt., T. W. Hickey is foreman.

I went through the 400 and 500-foot levels of the Jumper mine, one of the famous properties on the Mother Lode, near Stent. Although sixty stamps are incessantly pounding on ore from the Jumper (this being the largest mill in the county), it would seem as if there were

ore enough in sight to keep them going for a generation without uncovering reserves in deeper levels. Sinking is constantly going on. They are now down to the 1150 level, and ore is being taken from the 850 and 1000-foot levels. The Jumper supplies free-milling ore, the values being saved in the batteries and the plates. There are no sulphurets worth saving. The mill is run by power from the company's own electric plant, on Sullivan creek, for six months each year, after which it falls back on the Tuolumne Power Co., which also supplies power for the large air compressor, which in turn runs the hoisting engine. By reheating for the engine, the efficiency of the compressed air is increased 25%. The air is not reheated for the drills in the mine, but is taken direct from the receiver. The Jumper Co. has purchased the Golden Rule mine, adjoining it on the north, and the two mines are run in conjunction. It it probable that in the future a new shaft, at a central point, may be sunk for the two mines. At present the Golden Rule has its own hoist, and mills its rock at the Jumper. About 120 men are employed at the Jumper; 40 at the Golden Rule. The owners are business men of Glasgow, Scotland. P. Geo. Gow is general manager; M. D. Kelley, superintendent; O. A. Cecil, metallurgist and accountant; J. T. O'Brien, foreman.

The Mazeppa mine joins the Jumper on the south. This company has no mill as yet, and is developing its property. It contemplates the erection of a 20-stamp mill. The shaft is 450 feet deep, and there are about 800 feet in drifts. As greater depth is reached, the present steam hoist and compressor machinery will be replaced by something heavier, to be run by electric power. San Francisco business men own this property. The Supt. is H. M. Pease, one of the supervisors of Tuolumne county. Fifteen men are employed at present.

The High Point Mining Co. (Ltd.) of Des Moines, Iowa, is doing development work at Stent. At the Manhattan mine a shaft is being sunk by the aid of a horse whim, but machinery is on the ground for a steam hoist. A depth of 80 feet has been reached, but 200 feet will be sunk before crosscuts are run, at which point it is expected the ledge can be tapped within 500 feet. The Alder Creek Co., also composed of Iowa people, under the same management, is developing the Imogene mine, joining the Manhattan on the north. At the latter shaft there is a small steam hoist, and 200 feet in depth has been attained. They are now crosscutting to strike the ledge. The prospects are considered good at both of these mines. O. O. De Pew is Supt. About twenty men are employed at the two properties.

The Eagle Shawmut mine, on Wood creek, three miles southwest of Stent and about the same distance east of Chinese Camp, is a great property about which little has been written; it is owned by Rosenfeld & Sons of San Francisco. The plant is extensive and excellent, and is housed in ample buildings. The power employed is water under a 480-foot fall, transmitted by wire from a 7-foot Pelton wheel; but there is a large steam plant in reserve. The mill contains forty stamps and sixteen 6-foot Frue concentrators. Below this is a Gates sulphuret saver with forty tables. The slimes from the saver are treated in an agitating cyanide plant. The ore is drawn by mules through a 3000-foot tunnel, in the face of which the hoisting station is located. The tunnel strikes the ledge 500 feet from the surface, and a shaft extends into the mine from this point. Each car of ore is weighed and sampled before being dumped in the mill. Two electric dynamos supply power at the machine shops, as well as lights for the entire mine, works and village. The machine shop is extra large and well equipped. There is a large two-story change building at entrance of tunnel, containing private room for the foreman, etc. Nearly 200 men are employed at the Shawmut. D. Dorward is Supt.; C. Jackson, foreman.

The Mammoth, Orcutt and Republican mines lie a short distance south of the Shawmut. The Mammoth has been considerably developed in years past, and possesses a 10-stamp mill, but it is now idle. Work is progressing at the Republican, however, which is controlled by the same parties, and ore will soon be taken out here and crushed at the Mammoth mill. The shaft at the Republican is down 400 feet, where considerable water was encountered, necessitating additional pumping facilities. The properties mentioned are managed by Thos. McGovern of Sonora. A. G. Keith is foreman at the mine. These mines are close to Jamestown, on the main Tuolumne river.

The Clio, near Jacksonville, has a large ledge and development work is being earnestly prosecuted. It adjoins the Republican on the southeast. The Kelley, on the northwest, belongs to the same company, composed of Boston men, represented by J. E. Potter, one of the owners, who is now in charge. A small hoist run by a horse whim will soon be replaced with a substantial steam or electric hoist. From indications now apparent, it is probable a 40-stamp mill will be put up this year. There is a splendid site for such a mill on the steep bank of the main Tuolumne river, with a good wagon road at the base of the hill. The Clio is looked upon as a coming mine.

Jamestown, Jan. 23.

(Special Correspondence).—Carters will be a point of importance, the practical terminus of the Sierra Railway, extending from Oakdale eastwardly. The West Side Flume & Lumber Co., in which the Crocker estate is a large stockholder, is building a narrow-gauge line from Carters into the timber lands of the corporation, twenty miles beyond, but the road will be used for private purposes only. It is planned to run logging trains from a heavily timbered belt of the Sierras in Tuolumne county to a large sawmill now building at Carters. One hundred and sixteen men, under charge of T. L. Hiett, chief millwright of the W. S. F. & L. Co., are building the mill. It will be 200 feet by 75 feet; daily capacity, 100 M feet. When completed a sash, door and box factory will be erected close by. The corporation owns much land of a mineral character, and there is an increasing production of sulphurets and smelting ores in the eastern belt. It is announced that an electric power and light plant is projected at Carters by the W. S. F. & L. Co.

With all these industrial advantages, Carters will not be a Paradise for tradespeople. Although there will be much business done in supplying with the necessities of life the people who will live at Carters, most of this business will be transacted by the West Side Co., which is building to accommodate its commercial department and supply its office needs. The West Side establishment will be a department store and will render precarious the existence of small stores in its neighborhood.

Carters, Jan. 20.

At the Santa Ysabel G. M. Co.'s property the new 40-stamp mill will soon be ready to begin. The new electric hoist, which will carry down 2000 feet, will soon be started. The new power drills are now in readiness and will do double the work of the old drills. Sinking on the central ore shoot has been carried down 800 feet, and sinking operations had been suspended, as with the old hoist sinking below that level was not practicable. With the electric hoist, work will be resumed, carried down 2000 feet and development of the seventh and eighth levels carried forward.

The Harvard G. M. Co.'s property is five miles north of the Santa Ysabel mine. The building for the 60-stamp mill is finished and a portion of the machinery in position. When the first twenty stamps are in position work begins. A vein of ore, 8 to 10 feet in width and assaying $8 per ton, has been found.

COLORADO.

BOULDER COUNTY.

(Special correspondence).—R. J. Walter, Supt. of the B. &. M mine, reports the sinking of the 600-foot shaft on that property to greater depth. The work goes on at the rate of 100 feet per month.

A part of Ward was destroyed by fire on the 24th. It did not reach the mills and mines just outside the town; loss, $50,000.

Ward, Jan. 21.

Twenty tons of smelting ore have been shipped from the Newmarket, the production of four men for seven weeks.

The President shaft on the Wellington group near Gold lake has been free from water and partially retimbered. The Mgr. states that he has sufficient funds to develop the property. The shaft is 130 feet deep.

DOLORES COUNTY.

The Colorado Concentrating & Milling Co. is shipping concentrates from Rico to Durango. The saving is estimated to be 85%.

FREMONT COUNTY.

Florence denies the recent locally published statement that the oil output of that district was giving out. The National Extraction Works will use coal for roasting ore where oil fuel is now used, because older customers of the oil companies require the fuel, and until the oil output can be greatly increased these companies cannot be supplied with fuel oil. The fuel oil produced at Florence is the refuse of petroleum after the illuminating oil and gasoline have been extracted that is particularly in demand by smelters and reduction works. Several years ago the oil producers could not get rid of it at 50 cents a barrel, but it is now worth nearly $1 a barrel. Four gallons of fuel oil is equivalent in roasting to a half ton of coal. It is cheaper at first cost than coal, and leaves no cinder. The oil companies are now drilling seven new wells.

LAKE COUNTY.

Chronicle: Two products are now prepared by the Leadville smelters, lead bullion, containing gold, silver and copper, and a copper matte, in which are silver and gold. It is the intention of the Boston Gold-Copper Co. to erect a converter and separator for separating the copper from the gold and silver.

To increase the matte product two new furnaces of the same capacity as the present one, 300 tons a day, will be erected at once. It is expected to have all of the new machinery installed by May 1. If necessary the pyritic smelter can then be in a position to treat 1000 tons of ore per day, and turn out a refined gold, silver and copper product, leaving a refuse slag worth less than 30 cents a ton.

SAN JUAN COUNTY.

The Sultan Mining, Smelting & Power Co. proposes to mine ores from Sultan mountain, smelt them, and produce from the water power of the Animas river electricity to light and furnish power for mines and mills in the vicinity.

SAN MIGUEL COUNTY.

The Tomboy mine output for '99 was over $600,000. The men are now working in better ground and in ore that is turning out better values than ever before.

At the Liberty Bell fifty men are pushing the mill addition and new cyanide plant to completion.

K. Benson recently sold his Butterfly mine and mill at Ames for $200,000.

SUMMIT COUNTY.

(Special Correspondence).—J. P. Lambing, formerly of California, is having built in Denver an excavator for placer work, to be used on the Blue river, where he has a tract of placer ground in which Pennsylvania parties are interested with him.

Mining Reporter: Summit county miners are enjoying a streak of luck from an unusual source. The ores from this county are in great demand on account of their rich lead contents. While the smelters refuse to accept ore from Cripple Creek unless it contains two ounces or over in gold, they are in the market for any ore from Summit county that has 20% or over of lead. The largest proportion of the ore shipped from there runs from 20% to 60% in lead, and it is richer in gold than any galena ore found elsewhere in Colorado. One shipment recently made ran 48% lead, three-fourths of an ounce gold and ten ounces silver. As ore of this grade gets a free smelting charge, the miners of Summit have a big fortune before them in this rise in the value of their ores.

The fact that the Germania lessees have to throw quartzite carrying from $4 to $6 worth of free gold over the dump because it cannot be smelted at a profit, is an argument by the Journal in favor of a custom gold mill. If there were a custom gold and concentrating mill there, they would have 3 feet of ore that could be broken at a profit, besides their high-grade streaks. A custom modern gold mill that could make a smelting grade of concentrates, in addition to saving the free gold values, would do a good business.

TELLER COUNTY.

(Special Correspondence).—The Morning Star, which side-lines with the Doctor on Raven hill, opened a rich vein of ore at 50 feet depth, some of which ran as high as $6 per pound. The property is in the hands of Sims, Reardon & Co., as lessees, and belongs to the Enterprise Co.

Cripple Creek, Jan. 20.

Pres. Williams of the Isabella G. M. Co. reports the record of the company for 1899 as follows: Total gross production of ore, $968,011.24; net smelter returns, $851,476.32; net profits of the company, after deducting all mining expenses and machinery changes, etc., $546,818.38; cash balance in banks to credit of company December 31, 1899, $476,796.06; amount paid in dividends during year, $270,000. The profits of the Isabella for 1899 amounted to 24% on the par value of the stock outstanding.

The shipments from Stratton's Independent mine for December aggregated 3150 tons; value $210,000, an average of about thirty-seven ounces per ton. The net profit was $140,000. The output for January will be larger.

Reports from the different sampling works and other treatment plants of Cripple Creek district indicate that the tonnage of high-grade ore is falling off in favor of the medium grade, showing that the big mines are disposing of large quantities of medium grade which has been stored away because of the glut at the mills.

IDAHO.

CUSTER COUNTY.

At Houston, in the White Knob Copper Co.'s smelting plant, a fourteen days' run gave twenty-two tons copper bullion. The plant has two stacks—one fifty, the other sixty tons capacity. The mine has been in operation two years. A shaft is down 700 feet and a drift run 500 feet in the direction of the ledge, which it is hoped to cut.

LATAH COUNTY.

The Gold Mountain M. & M. Co. has organized at Moscow; capital stock, $1,000,000; to develop and operate the Gold Mountain, El Dorado and Queen Hoodoo claims.

SHOSHONE COUNTY.

In eleven of the leading Cœur d'Alene mines are employed 2073 men—1357 Americans, 716 foreign born.

WASHINGTON COUNTY.

The Pacific & Idaho Northern Railroad is building from Weiser through the Seven Devils camp and has completed thirty-six miles. At Council a spur will be run in the vicinity of the Peacock and Blue Jacket mines; from Council the main line will be extended to and connect with the Northern Pacific. Fifteen carloads of ore have been shipped from the Blue Jacket mine. The ore is said to have showed copper, $80; gold and silver, $20.

MICHIGAN.

The output of iron ore from the Lake Superior region in '99 exceeded the total production of iron ore in the United States in any year prior to '98. Labor saving machinery of complete character has been introduced at mines and docks, and applied to every operatiom from digging the ore to charging the blast furnaces located more than a thousand miles from the mines. Powerful steam shovels dig the ore and dump it on the cars, run mainly by gravity to the shipping ports, where it is loaded into whaleback steamers and steel barges, then floated for hundreds of miles to the lower lake ports, and thence transported in steel cars to furnaces in Ohio and Pennsylvania. In one week during the past shipping season 173,000 gross tons of iron ore were shipped from Duluth. One dock has a capacity of 6000 tons of ore, and several of the pockets into which the ore is dumped from the cars hold 200 tons each. Thirty-eight steel steamships were required to load this ore in one week, and they averaged 5240 tons of cargo each. The ore runs directly from the ore pockets into the holds of the steamers.

The cost of digging ore and loading it on the cars at the open mines is 11 cents per ton, and the cost when delivered at the furnaces still low enough to enable the iron maker to manufacture crude iron on a great scale at less cost than is possible to make it elsewhere in the world, except, perhaps, in iron-producing districts of Alabama and Tennessee. Assuming that there will be an average production of 20,000,000 tons of iron ore in the Lake Superior region during the next ten years, it is altogether probable that the surface deposits, which have been weathered and thus prepared by Nature for economical reduction to the metallic state in the blast furnaces, will by 1910 have become exhausted. Then it will become necessary to resort to the ordinary underground mining methods. There are large deposits of lean ore in the Lake Superior region which have thus far been ignored, but will be found available when the richer ores are exhausted.

Corrigan, McKinney & Co. have secured the lease of the Ropes mine, six miles north of Ishpeming. They will reopen the mine, which is over 1000 feet deep and has produced $750,000 in gold and silver, and will rework the old tailings, estimated at 150,000 tons and carrying an average value of $4 per ton in gold and silver.

MONTANA.

Reference was made last week to the change at the Anaconda Co., from stamps to crushers and rolls, and the increased crushing capacity. For this, larger jig capacity is required and progress is being made along that line by providing greater capacity in the calcining or roasting department. Two calcining furnaces will be installed at the upper works as an experiment in that direction. The tests of efficiency made are said to give the revolving furnaces a high rating, and the calcining department may be enlarged by the addition of more furnaces of that character. Three new blast furnaces, excavating for which has already begun, will be built at the end of the present works east of the converter. There are at present six blast furnaces with a capacity of 200 tons a day each. The new ones, being about twice as large, the blast furnace capacity will be practically doubled. The product of the blast furnace is matte about 50% copper. These three furnaces will produce matte containing not less than 2,500,000 pounds of metallic copper monthly. For the accommodation of the furnaces a new building 140 feet in length and 40 feet in width is to be built and they

are expected to be ready to blow in by March 1. The Anaconda is shipping silver via Seattle, Wash., to a Chinese bank in Shanghai for Chinese coinage.

FLATHEAD COUNTY.

Work on the Snowshoe mine has been resumed. Thirty men are employed. Mgr. West says he has enough ore in sight to run the present mill for a year. The shaft is down 200 feet.

MADISON COUNTY.

E. H. Treriso, Mgr. Leiter mines, Leiterville, says the mine is looking well and that they have discovered good gold quartz.

NEVADA.

ELKO COUNTY.

A $10,000 bar of bullion and 100 pounds of cyanides have been received at Salt Lake from the Dexter mine, the result of sixteen days' run.

LINCOLN COUNTY.

The pay roll at De Lamar is $30,000 per month. The town has 1500 inhabitants.

STOREY COUNTY.

The unwaterer is still in successful operation in the C. & C. shaft. The water is now 140 feet below the level of the Sutro tunnel. There are 360 feet farther to go. Another $5000 installment was paid on the work on the 22nd instant.

WHITE PINE COUNTY.

At Ely the Ada mine has shown a copper ledge.

A nickel find is reported near the Gregory ranch in Snake valley, said to assay 15%.

NEW MEXICO.

BERNALLILLO COUNTY.

The mill for the Navaho M. Co. at Bland will have 100 stamps; a cyanide plant will be provided for the tailings. The Navaho mill, according to the plans, will have a capacity of 10,000 tons per month. If the original 100 stamps will not be able to handle this amount of ore per month an additional number will be added.

GRANT COUNTY.

(Special Correspondence).—Some time ago Messrs. Crawford, Bradley and Derbyshire put up $12,000, leased some property here, ran the mill eight months, and on January 1st had cleaned up $60,000 net profit. This was done with property that had been turned down by experts, and in the management of which others had made failures.

Silver City, Jan. 20.

OREGON.

BAKER COUNTY.

In the Baisley-Elkhorn mine, sixteen miles from Baker City, big ore shoots are opened and the Democrat declares there is ore enough in sight to feed the mill for years.

JACKSON COUNTY.

The gold output of Jackson county for 1899 is estimated at $250,000.

PENNSYLVANIA.

The Delaware, Lackawanna & Western Co. has begun closing its mines. Officials of the company declare this is done because of an over-production for market demands, but among the miners there is general conclusion that it is done for the purpose of anticipating any labor trouble by reason of the present unrest among the miners. The company has offered to deal with its employes alone, but refuses absolutely to receive any committee representing the Mine Workers' Union.

WASHINGTON.

OKANOGAN COUNTY.

(See illustrations front page.)

(Special Correspondence).—On the completion of the Northern Pacific Railway to the coast in 1893, little if anything was known of the existence of quartz lodes in the northern portion of the State of Washington which contained mineral sufficiently valuable to warrant their location or spending time or money upon them. Again at that date, unless the formation through which quartz veins ran was of a certain geological formation, all expert mining men at once pronounced them barren, or that mineral could not live in them, especially gold. However, as time passed on, some venturesome prospectors made investigations of the country and were bold enough to go against the prevailing opinion of the most eminent experts, and perhaps this class of investigators has received more encouragement from the MINING AND SCIENTIFIC PRESS of San Francisco than any other mining publication in the United States—not that that periodical or its editors and publishers did not have high regard for educated men in the mining profession, but they, as the saying is, gave hard-handed prospectors a chance, by listening to what they had to say and what they wrote, and, while in many instances the communications were not germs of diction, they were plain and to the point, and that class of articles became popular, not only with mining men, but expert mining engineers, who began picking up valuable information from men who had never looked into a work on geology. So it has come about in sixteen years that the northern portion of the State of Washington has kept pace with its northern neighbor, British Columbia, in point of discoveries of the precious metals, and today is attracting a large amount of attention from mining men and capitalists, who follow them for the purposes of investment, and the year 1899 closes with several dividend-paying mines, nearly all of which are gold producers.

In this connection Okanogan county enjoys the distinction of having the first gold-producer and dividend-payer in the State. It is located on Palmer mountain, in the northern central portion of Okanogan county, in what is now known as the Palmer Mountain district, and was named the Black Bear, which, with the War Eagle, was located by Joseph Hunter in the fall of 1887; these two claims were purchased by an association of individuals in Spokane in 1888, and the year following, with a 5-stamp mill, produced $150,000 in gold bullion, the average of the ore milled and saved on plates and vanners being $24 in gold. Differences, however, arose among the owners, throwing the property into litigation, from which it has just emerged, and a controlling interest secured by Toronto and Montreal people. During the past five months $20,000 has been expended in placing hoisting machinery, repairing the flume and mill and retimbering the shaft. By Jan. 1st, 1900, forty men will be working in the mine and the mill will be running; the first clean-up will be made by Feb. 1st. This is a brief history of the first dividend-paying mine in the State of Washington, and one that will shortly resume paying them. Naturally, at the time this property was working, it attracted much attention to this part of the country; but, it being 150 miles from rail transportation and a gold country, the Slocan, Rossland and other Northwestern camps springing up, attracting the public and railroads near them, together with the panic of the '90s, all kept the Palmer mountain country in the background; but during these dark days a party headed by John Boyd, a Loomis merchant, conceived the idea of securing a large number of claims on the south slope of Palmer mountain, extending from the base of the mountain, near Loomis, to the summit of the mountain, through which thirty well defined parallel ledges run in a northeast and southwest direction, and the running of a crosscut tunnel through them all. Not only did he conceive the idea, but he carried it out, and to-day the Palmer Mountain G. M. & T. Co. own forty-four contiguous locations and have a tunnel in 2614 feet, having cut fifteen veins, seven only of which show on the surface, and the face of the tunnel is over 1200 feet vertical in depth; the full length of the tunnel is to be 8400 feet and will give a vertical depth at the back or face of 4200 feet. It is needlsss to add that before it is completed, though continuously prosecuted, shafts will have to be sunk to give air. However, this is now provided for, as the tunnel at 3506 feet in length will cross the Black Bear vein very near the end line of the Bear location, or on the Helena Belle, owned by the Tunnel Co. The Bear is now engaged in sinking and will continue to the level of the tunnel and drift to it, taking their ore out through the tunnel; thus the first air connection is provided for. Of the fifteen veins cut in the tunnel, a thorough mining expert in the employ of one of the big corporations—the Canadian Copper Co.—states in a written report that he sampled them and that they vary in width from 5 to 42½ feet and carry ore from 12 inches to 35 feet, averaging $27.97 gold, the depth at which they have been cut ranging from 100 to 1000 feet vertical depth. This, perhaps, goes a long way toward settling the question of permanency, quality and quantity at depth. However, a Pittsburg party of gentlemen also had faith in the country, and on Mount Chapacca, directly across a small valley to the west, have been for two years developing the Golden Zone and have now 2000 feet of tunnels, four in number, one above the other, now all connected 400 feet, and have from a few inches to a full face of ore all the way down, all these tunnels being run on the vein and the depth gained 800 feet. A concentrator has just been installed with wire tram from the mine; it will start up early in January. They claim they have sent samples weekly to Pittsburg, their average values being $30 in gold, and that they can concentrate eight to ten into one.

The persistent work and good showings made particularly in the Palmer mountain tunnel has had a marked effect on the fortunes of the district, and since June 1st, 1899, the following important deals have been consummated: The Gold Hill property, involving $250,000; Wehe Con. M. & M. Co., $100,000; Paskell group, $50,000; Mariotta, $50,000; Bull Frog, $100,000; Chapacca Gold-Silver, $50,000; King Solomon, $25,000; Six Eagles, $25,000; Okanogan Free Gold, $75,000. When it is said these amounts involved, it is meant purchase price, development during bonding period and amount placed in the treasury to carry out plans made by competent mining engineers employed by the various companies.

It might also be interesting to here state that the Bull Frog has just installed a cyanide plant, they having first had their ores tested by that process, a carload, having an assay value of $19.50, giving returns of $17.50 gold and the solution contained $1.25.

The Okanogan Free Gold mines completed in October the installation of a 10-stamp mill and Wilfly concentrating tables; the run for November produced 240 ounces in gold, and the manager states he saved 50% of the values in the batteries, 37% on the plates and 10% in the concentrates, making 97% of the assay values. He also states he can mine and mill for $2.50 per ton. The gold goes about $16 per ounce, and the average is, say, a little over $8. He also states they have sufficient ore in sight for a year's run.

Perhaps it would be superfluous to further extend an article on the Palmer mountain district, Okanogan county, Wash. Let the facts speak for themselves. However, one more very imporatant fact is in evidence: not a single one of the properties mentioned in this article have asked the general public to buy their stocks; they are all owned and managed by incorporated companies, but in every instance the original subscribers to the stock have furnished the money for all purposes; further, in nearly every instance the stock has been pooled for a certain period, or until the mine was upon a dividend-paying basis. In fact, up to this time legitimate mining is absolutely the rule. JOHN I. BOOGE.

Loomis, Dec. 17.

STEVENS COUNTY.

(Special Correspondence).—Development work of Republic for December totals 3073 feet. The Gopher, adjoining the Mountain Lion to the east, has purchased the steam hoist and pump of the Bodie Co. The Bodie shaft is down 350 feet already, and a larger hoist will be required for deeper development. The Quilp mine is to have a compressor plant.

The Boundary-Republic M. Co., Ltd., capital stock $1,500,000, has been incorporated in Montreal, to operate the Quilp mine, the Valley group of three claims, east of this camp, and the Yankee Girl group of three claims in the Boundary district, three miles from Grand Forks, B. C. The Yankee Girl property has already made several smelter shipments of $30 ore to the Trail Smelter. The company control the Quilp stock and a three-fourths interest in the Valley group. The incorporators are largely stockholders in the Republic mine.

Supt. Jacklin of Capt DeLamar's Mercur mines, at Mercur, Utah, has been engaged by the Republic Con. Co. to superintend the construction and operation of the new 200-ton mill. Mr. Jacklin has had exceptional success in cyaniding complex ores, and has already made exhaustive experiments with the ore from the lower levels of the Republic mine, at the Mercur mill, before accepting the position here, and he promises as high extraction as was secured by the old Republic mill at reduced cost.

S. H. Johnson of the Johnson Pneumatic Process Co., London, Eng., is in camp, conducting experiments on Republic ore, at the instance of his own company. He has been using bromide of cyanogen in his experiments to assist the action of the cyanide, but will now use the straight cyanide in an effort to compare the respective merits of the direct cyanide and the bromo-cyanide processes. Mr. Johnson says that these roasted ores are the best he has ever seen for filtration, so far as he knows. Mr. Johnson thinks that the Republic ores can be handled for $1.40 per ton. He says he has secured 86% extraction in a three-hour treatment. An extraction of 33% of the silver values was secured and Mr. Johnson believes that this also can be increased. It is doubtful, he says, however, if the increase of extraction in the case of either the gold or silver can be carried past a certain point without increasing the expense to such an extent as to annul the profits.

One of the richest surface showings of galena yet found on the South Half has just been uncovered on the Combination No. 1 and No. 2 claims in Davis Camp. It was a Jan. 1st "jump" location, and is an instance of accidental discovery last summer on staked ground on which assessment work had not been done, and the prospector covered up his find until the first of the year, when the old location had run out. Surface assays give returns of $80 in lead and silver.

About seventy-five wagon loads of machinery have been received in camp during the past ten days, and as much more is awaiting transportation at railroad stations of Grand Forks and Marcus, or is en route to these points for Republic mines.

Republic, Jan. 15.

FOREIGN.

BRITISH COLUMBIA.

The Provincial Government has declared its intention of amending its alien exclusion law so as to hereafter permit Americans to hold claims purchased from Canadian locators. Such a concession satisfies the Americans at Atlin.

At Sandon the ill feeling between representatives of the Silver-Lead Mine Owners' Association and members of the Miners' Union, engendered by the strike, which has extended over the past eight months, has culminated in the arrest of Secretary Hegler, of the Miners' Union, on a charge of making threats against non-union miners, and conspiracy against the business interests of the mine owners. Recently there were brought from Minnesota twenty-two Finns, who have gone to work at the mine owners' rate of $3 per day of eight hours. It is charged that Hegler, as leader of the crowd of strikers, has persistently threatened the Finns.

CHINA.

The consul at Shanghai reports there is one industry especially, mining, that has hitherto been almost wholly neglected in China. In 1896 an imperial decree was issued that the mines should be worked to their fullest extent, but it availed little, since not the slightest attempt was made to introduce modern methods of mining. For centuries the Chinese extracted precious metals in the primitive, slow and clumsy method still in vogue. Foreigners have frequently tried to engage in mining, but have been thwarted by red tape. If they begin work they find the superstition of the natives an almost insuperable obstacle. That demons make their homes in mines is the firm conviction of the natives, and only by means of large bribes can their dread of the diabolical beings be dissipated. The result is that the rich mines of the country are neglected. Government employes are at work in a few copper, silver, gold and iron mines, but their labor is not very profitable, and for the very reason that they spend months at a task which miners equipped with modern machinery could perform in a few days.

MEXICO.

Chihuahua Enterprise: The conducta from the Sierras in charge of Joaquin Chavez brought sixty-two bars of bullion, total value, $143,700.

The Santa Eulalia Mining Co. has struck rich ore at a depth of 1305 feet at Santa Eulalia. A solid body of lime rock has been pierced. Drifting has resulted in finding bodies of ore assaying from 25 to 156 ounces silver, and from 11% to 32% lead.

The Mecatona Con. M. Co. is operating its gold mines, twenty kilometres south of Parral, Chihuahua. Hand samples of ore and talc taken from the Mercedes and Mecatona patios assay forty-one ounces gold and 1200 ounces silver. Settlements made with the Mexican Ore Co., Chihuahua, for ore sold them in large lots were for two and one-half ounces gold and 326 ounces silver per ton. H. L. Brown is Supt.

TASMANIA.

The last half-yearly report of the Mount Lyell Copper M. & R. Co. states that during the half year 143,686 tons of ore were mined and sent to the reduction works. The whole of the furnaces are running, Nos. 10 and 11 having been blown in during the half year, and the duplication of the converter plant has been completed. The results of this department show an increase on former output, 4592 tons of blister copper having been produced during the period, as compared with 2858 tons for the previous half year. The daily consumption of the company's ore in the No. 2 smelting plant alone frequently approaches the 100-ton mark. The No. 1 smelting plant is being chiefly confined to the concentration of first matte. Deliveries of ore from the Lyell Tharis have continued, and the directors recently exercised their option of purchasing from that company a further 25,000 tons on the same terms as before. The North Mount Lyell Copper Co., Ltd., have also commenced forwarding their ore under a contract lately entered into with them for the delivery of 6000 tons. The King Lyell Gold & Copper Co. have also forwarded ore from their mine during the half year. The total amount of purchased ore smelted was 13,017 tons. The construction of coking ovens has been undertaken at Port Kem-

bla, New South Wales, and it is expected that this year the whole of the company's coke requirements can be supplied from this source, effecting a saving on the prices hitherto paid for this fuel. The directors report that, after deducting Tasmanian dividend tax, £4478 5s., depreciation on the company's plant, £16,593, mine exploration, not included in mine preparatory works overburden account, £4686 10s 6d, the net profit for the six months has amounted to £182,596 3s 5d. These improved results are due to the increased output and the high price of copper.

THE KLONDIKE.

Vice-Consul Morrison at Dawson City says that many miners will make the trip out of the Klondike this winter down the river and to Cape Nome. While Dawson has lost in population during the past summer, it has gained in wealth. The gold output for the past year was estimated at $15,000,000, or $3,000,000 more than the preceding year, and big results are expected in the future from the introduction of steam mining machinery. United States Mail Carrier Holcombe has arrived at Eagle from Valdes, completing the first winter trip as carrier of government mail from the seat of the Yukon, a distance of 450 miles. Holcombe says he had a perilous trip. He encountered many hardships, and during the trip ten of his twelve horses died or had to be killed. He had a working force of eleven men, who were employed constructing cabins for mail stations, one created every twenty miles. From now on the department hopes to give monthly mail service between Valdes and Eagle. One consignment of mail has already come out over the new route. From the coast terminus of the trail a telephone line extends seventy-five miles inland, and it is the intention of the Government to extend the line through the Yukon next summer.

THE YUKON.

According to recent arrivals at Victoria a strike has been made on the south fork of the Big Salmon river; a number of those who were on their way from Dawson to the coast have gone to the new placers about 100 miles north of the Atlin country.

A Vancouver dispatch says: "The reports of fabulously rich quartz strikes in the north should be liberally discounted. The reported rich finds of copper-gold quartz at Great Slave lake, in which the Hudson Bay people are interested, are fictitious."

SOUTH AFRICA.

The Petit Bleau, Brussels, on the 24th inst., published the following official report of the State Engineer on the situation of the Robinson mine: When the Transvaal Government took possession of the mine the shops contained almost nothing of $123,140 of mineral entered on the books. Provisions estimated at $308,195 were found to be worth $30,750. It will be two years before the mine can be worked again.

Censored Johannesburg advices of the 19th ult. say that eight mines are being worked by government orders, five of them under the direct control of government officials. These eight are the Village Main Reef, Wemmer Gold, Ferreira, Robinson, Bonanza, Rose Deep, Pioneer and Worcester. The gold output for September was 426,556 ounces. This was from sixty-six Rand companies and eight companies outside. The output for October was about 18,000 ounces during the period subsequent to the declaration of war. The State Mining Engineer, J. B. Munnik, has made his headquarters at the Robinson. His running expenses are less per ton than under the former management. He has opened the Robinson foundry, and is able not only to do the mining work, but contribute largely to the expenses for the Army Department. When the mines were first taken over, it was found that many important parts of the machinery had been damaged or hidden, but these difficulties were overcome. There are now 10,000 natives and 4000 whites employed in the mines, and other mines are being opened as fast as men can be organized. Mine managers and others seem to have been under the impression that the stoppage would only be a matter of weeks, and no attempt appears to have been made to make arrangements for the care of the machinery or the underground workings. Large quantities of valuable property had been secreted in the mines—personal effects, provisions, pianos, buggies, paintings, etc. Many such things were only discovered just in time, when the water had reached to within a few feet of them. There were also discovered quantities of arms and ammunition, and the Government claims to have made many important discoveries that will be of use to them in due course. Although the books of many companies were removed, prior to the outbreak of war, to Capetown and Durban, an enormous quantity of documents has been overhauled by government-appointed experts, who are now preparing a report which is "to create the greatest sensation of modern times." A large number of mines are filling with water, owing to pumping being stopped. As the rainy season is now on, water is making at a great rate, and in a short time the pumps will be drowned out and much damage done. The Minister of Mines has been holding interviews with the representatives of the companies as to starting pumping. A number of miners declare that French and German shareholders control the majority of the stock, and that they should, therefore, be permitted to pump. The Government is not in favor of having many foreigners in the country, and all the burghers are required to meet the English. The problem is a difficult one. Apart from the labor problem itself, it is debated as to whether the labor that might possibly be devoted to pumping might not be more profitably employed in growing food, inasmuch as it is considered that there is abundance of money in hand, both here and in Europe, for all necessary purposes.

Personal.

H. C. WOODROW has returned to Redding, Cal.

BYRON E. SHEAR has returned to Denver, Colo., from the East.

GEO. H. EVANS returns to Summit county, Colo., about Feb. 1st.

J. F. MEIKEL is the new Supt. Red Boy Con. M. Co., Baker City, Or.

JULES DE TILIA, a professional prospector, has gone to northern Idado.

R. B. THOMAS has assumed charge of his new smelter at Cerrillos, N. M.

CURTIS H. LINDLEY has returned to San Francisco from Grass Valley, Cal.

W. H. COMBS, of Denver, Colo., has been in Boston, Mass., on mining business.

F. BLACKFORD, of Butte, has been elected president Montana Society of Engineers.

WM. STEPHENS is building a 60-stamp mill for the Harvard G. M. Co., at Jamestown, Cal.

H. H. SNEDIGER, of Denver, Colo., recently returned from the Lake Superior copper regions.

H. B. UNDERHILL, JR., Sec. Selby Smelting & Lead Works, San Francisco, is in Honolulu.

WM. BUCKINGHAM, of Chicago, representing Fairbanks, Morse & Co., is at Williams, Ariz.

CAPT. W. M. JAMES has given up his intended South African trip and will return to California.

J. R. MAGRUDER, Mgr. New York & Sonora Mining Co., has returned from Denver, via Nogales.

E. K. GESFORD, a Colorado miner and prospector, is inspecting mining property in the vicinity of Redding, Cal.

GEORGE A. ANDERSON, American Mgr. MacArthur-Forrest cyanide process, from Denver, is in Salt Lake City, Utah.

T. E. FARISH is developing the Whipsaw Copper Mining Co.'s property at Castle creek, Yapavai county, Ariz.

W. G. CAMPBELL and H. B. Gillespie have formed a partnership in Denver, Colo., to engage in the mining business.

CHAS. BROCKINGTON has resigned the superintendency of the Omaha, Lone Jack and Homeward Bound mines, Nevada Co., Cal.

EDGAR RICKARD has returned from London, and is in Berkeley, Cal. He will examine some California mining property next month.

A. W. HOLT, of the Kearsarge mine, Columbia, Tuolumne county, Cal., is in San Francisco to buy a 10-stamp mill for that property.

J. D. FEE, of Pueblo, Colo., who has finished building the El Paso mill, Elizabethtown, N. M., is examining California mining property.

JOHN HOFFMAN has been appointed superintendent of power at the Keswick, Cal., smelter, succeeding J. J. Jones, who recently resigned.

J. B. GRAHAM, who was employed in this office in 1860—just forty years ago—is now publishing the Bulletin, at Bingham Canyon, Utah.

COL. A. R. BRODIE, formerly of the Rough Riders, is in Phœnix, Ariz. He is now operating gold and copper properties thirty miles from Prescott.

JAS. CREIGHTON, formerly of the Bunker Hill & Sullivan mines in the Cœur d'Alenes, succeeds Mark Hopkins as Supt. of the Tesora M. Co., Utah.

G. H. HILL, of the Co-operative Mining Syndicate, Seattle, Wash., goes to Amalfi, U. S. of Colombia, S. A., to operate mines there for his company. Like every other miner everywhere throughout the world he has this paper follow him.

JOHN T. DONNELLAN, who is operating copper properties at Ray, Riverside district, Ariz., is endeavoring to enlist municipal support in building a road to Phœnix.

F. S. ROUMAGE, of Auburn, Cal., goes on the 1st prox. as Supt. Omenica M. Co., operating on the Naas river, B. C., the property to be worked by hydraulic elevator.

C. P. SCHUMACHER and W. L. Cooper, formerly of Leadville, have formed a partnership to engage in the mining business, with offices in the Jacobson Bldg., Denver, Colo.

P. J. COLE, ex-mayor of Phœnix, Ariz., in conjunction with Goodwin brothers of Globe, is opening up some copper properties some twelve miles from Ray camp on Mineral creek.

V. N. MCGEE, a Stanford, Cal., graduate from the department of civil engineering, has been appointed professor of civil engineering in the Imperial University at Tientsin, China.

EX-U. S. MARSHAL LONG of San Francisco is in Tuolumne county, Cal., interested in mining development at Tuttletown, where his company is about to install a 20-stamp mill.

R. B. STANTON is superintending for Eastern men the development of placer mines on the Colorado river. He made a trip through the Grand Canyon of the Colorado two years ago.

P. T. FARNSWORTH succeeds Jas. A. Cunningham as Pres. and Mgr. Bullion-Beck, Utah, M. Co., the former having control of the stock. Kent Farnsworth succeeds Jno. A. Kirby as Supt.

J. W. BENNIE, Supt. of the smelters for the Mt. Copper Co. Ltd, Keswick, Cal., has started on a visiting tour to the smelters of Australia, expecting to return via New York on an inspection trip to the smelters of the United States.

T. W. GOAD is in Denver, Colo., from London, Eng., on a trip to Montana for his company. He expects to be able to put through a deal for the Bannack placers and has an option on a group of low-grade gold mines in the Feather river district, Oregon. He says: "The only trouble I find in this country is the high prices at which good mining property is held. The mines are here and the British investing public would like to get them, but the prices are frequently put out of the reach of legitimate investors."

Catalogues Received.

Whether it be a catalogue or a gas engine, the Union Gas Engine Co. of San Francisco always produce a good article. Their latest catalogue, No. 13, is an illustrated pamphlet of 66 pages, devoted exclusively to marine engines, and tells any one interested in that class of machinery about as much as he would ordinarily want to know concerning marine engines. There isn't much technical detail or description, but there are 55 pages of fine engravings, illustrating different sizes and styles of marine engines made by the firm, and showing the vessels propelled by their motors, the capacity, the name of the vessel, where it is plying, who owns it, etc. The waterscapes and landscapes thus portrayed are works of art, and the whole thing gives an excellent idea of the capacity and usefulness of these engines. The Union Gas Engine Co., 244-246 First St., San Francisco, will send one of these handsome catalogues to anywhere on request.

Recently Declared Mining Dividends.

Buffalo Hump, Idaho, M. Co., first dividend 1%; payable Feb. 1.

Quincy, Mich., M. Co., semi-annual dividend $5 per share; payable Feb. 15.

La Bufa, Sonora, Mexico, $500 per share; Jan. 1.

Boston & Montana Co., Mont., regular quarterly dividend $5 per share, and $3 extra; payable Feb. 20.

Consolidated Gold Mines Co., Colorado Springs, Colo., 1 cent per share, $10,000; Jan. 25.

Modoc G. M. Co., Cal., 1 cent per share, $5000; Jan. 22.

Books Received.

"Power Transmitted by Electricity," octavo, pp. 240, illustrated, written by Philip Atkinson, second edition revised and enlarged, discussing principles of the electric motor, applications of the stationary motor, station construction and equipment—a work in which primary instruction and more advanced technical requirements are supplied. Published by the D. Van Nostrand Co., 23 Murray St., N. Y. City, $2.

Industrial Notes.

—The Colorado Iron & Fuel Co. will have a $25,000 display at the Paris Exposition.

—The bondholders of the San Joaquin, Cal., Electric Co. will construct a large reservoir in Crane valley, Cal., to cost $40,000.

—On export bills of lading and receipts issued by carriers from the United States by rail to Canada and Mexico a 1-cent revenue stamp is all that is required.

—It costs more to get a ton of freight from San Diego to Chicago, 2265 miles, than to Hongkong, 7000 miles; $34 to $38 to Chicago; to Hongkong $8 to $10.

—W. H. Holabird, of Los Angeles, Cal., goes to Washington to arrange for the emigration of a colony of 14,000 people from Russia and 11,000 from Canada.

—The United States Government has assurance from Costa Rica and Nicarauga that they are willing to lease territory to the United States for 100 years, if necessary, for the construction of the Nicaragua canal.

—Colorado members of Congress will try to have the Government place a geologist and mineralogist at the United States Mint in Denver to examine and determine the nature of the different ores discovered throughout Colorado.

—Stockholders of the Consolidated Kansas City Smelting & Refining Co. will hold a special meeting in New York on February 2nd, to consider a proposed reduction of capital stock of the company from $4,500,000 to $2,500,000.

—At the annual meeting of the Giant Powder Co. in San Francisco on the 24th the financial statement showed net profits of $209,868.04 in fourteen months, payment of $119.976 in dividends, a net surplus of $89,893.04, and assets of $1,269,838.71.

—Arrangements have been made by the Canadian Postal Department to carry a limited quantity of newspapers to Dawson and Atlin during the winter months. To Dawson the quantity is limited to 500 pounds per week, and to Atlin 300 pounds semi-weekly.

—Gen. Greely, of the Signal Corps, has shipped to San Francisco $50,000 worth of material to be used in establishing the army telephone and telegraph lines in the Philippines. The shipment will consist of miles of wire, telegraph and telephone instruments, batteries and other things which go to make up a complete equipment for telegraph and telephone stations. The material will reach Manila in March, Col. Allen, who is in charge of the Signal Corps in the Philippines, will perfect a system of communication.

—Yreka, Cal., wants water works of the capacity of 1,000,000 gallons daily. .Present daily consumption, 250,000 gallons. Cast iron pipe will weigh as follows: 10-inch, 62½ lbs per foot, $2.15 per foot; 8-inch, 45 lbs, $1.60: 6-inch, 30 lbs, 1.10; 4-inch, 19½ or 20 lbs, 75 cts; 3-inch wrought iron, 55 cts, and 2-inch, 30 cts; 15-inch No. 14 steel, $1.15; 12-inch, No. 14, $1; 12-inch No. 12 steel, $1.25. Wooden pipe: With head to 40 feet, 75c per foot; 40 to 50 feet, 81c; 50 to 60 feet, 88c; 60 to 70 feet, 95c; 70 to 80 feet, $1.02; 80 to 90 feet, $1.09; 90 to 100 feet, $1.16.

—Russia is using American manufactures as the best and cheapest in the world. She has bought thousands of tons of steel rails for the Siberian railroad, 300 locomotives, and several warships. In the Transsiberian railroad Russia has invested over $300,000,000. The line is now complete from St. Petersburg to the Amour river, and will be finished in eighteen months. Siberia, with a scattered population of 5,000,000, is equal in area and resources to Canada and the United States, and offers a market for American enterprise. Russia welcomes American capital, placing hardly any tariff restrictions on imports and is arranging for an American-Russian exhibit to follow the Paris exposition.

—The new masonry and concrete drydock at Mare Island, Cal., will be the largest of the kind upon the coast, and capable of taking the largest battleship. Dimensions: Length on coping from head to outer end of table, 772½ feet; length on coping from head to outer gate sill, 750 feet; length on floor from head to outer gate, 719 feet; width on coping in body, 141½ feet; least width on floor of body, 80 feet; width at entrance at mean high water level, 101 feet; depth from coping to floor in body, 38½ feet; depth over sill at mean high water, 30 feet. There will be 30 feet of water at the entrance and 8 feet more inside. Cost about $1,200,000. The pumping plant will consist of three centrifugal pumps and six tubular boilers; capacity 125,000 gallons per minute. The steel caisson to close the entrance to the dock will be 105⅝ feet long, 22 feet wide, depth from the bottom keel to under side of upper deck 35¾ feet.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR WEEK ENDING JAN. 16, 1900.

641,360.—AMALGAMATOR — L. H. Barricks, S. F.

641,359.—ORE SEPARATOR — J. Barron, S. F.

641,490. — LIFTING JACK — A. Bauer, Boyd, Or.

641,362. — HOISTING APPARATUS — H. Behr, S. F.

641,367. — TURNING MECHANISM — G. Breuer, Sacramento, Cal.

641,271. — PIPE WRENCH—J. H. Condy, Stockton, Cal.

641,451.—WRENCH—W. T. Hatton, Canyon City, Or.

641,393.—MEAT HANGER—W. O. Johnson, Seattle, Wash.

641,597.—WATER HEATER—C. S. Kinney, Arroyo Grande, Cal.

641,317.—TOOL HOLDER — R. S. Moore, Oakland, Cal.

641,531.—COMB — W. P. Murphy, San Jose, Cal.

641,606.—MIXER—V. J. A. Rey, S. F.

641,555. — GAS GENERATOR — A. F. Shriver, Arbuckle, Cal.

641,558.—OIL BURNER—S. Spillars, Pomona, Cal.

641,652. — EXTRACTING GOLD — A. G. Stephens, Los Angeles, Cal.

641,419. — AGITATOR — H. C. Wheeler, Winchester, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRIC AMALGAMATORS. — L. H. Barricks, San Francisco, Cal. No. 641,360. Dated Jan. 16, 1900. This invention relates to a device for separating gold and silver from pulp and ore with which they are associated. The object is to provide a means for increasing the activity of amalgamation of metals which can be thus effected. It consists of a metallic frame or body having a perforated plate secured to its bottom, a porous plate resting upon the metal plate forming a bottom upon which the mercury is placed, a pan or box upon which the frame or body is supported, adapted to contain a saline solution, a sluice connected with the frame above the porous plate and having a copper plate in the bottom dipping into the mercury and serving as a negative pole of an electric circuit, and a plate in the pan or box serving as the positive pole.

FRICTION WHEEL GRIP FOR ORE FEEDERS.—C. D. Hooper, Telluride, Colo. No. 641,390. Dated Jan. 16, 1900. This invention is designed to provide a friction wheel and gripping device which is connected with ore feeders so as to advance the latter by small impulses, and thus regulate the feed of ore from the hopper or receptacle to stamp or crushing mill. The wheel has a central web and flange extending some distance on each side thereof. A rectangular yoke of sufficient width encloses this flange and extends inwardly upon each side, and a block having approximately the width of the flange of the wheel is introduced between the flange and the inner wall of the cross bar of the yoke. Independent blocks are confined between the inner arms of the yoke, and the inner periphery of the flange by stub-bolts, and have a curvature substantially corresponding with that of the flange. The blocks rock on the bolts, and are caused to bind against the flange of the wheel when the lever arm of the yoke is moved in one direction, and they slip so as to allow the yoke to be moved with relation to the wheel when moved in the other direction. This movement is effected by connections, so that the falling of the stamp causes the tappet to act upon the lever arm connections and thus move the feed device.

TRUSS.—W. R. Close-Erson, Onehunga, New Zealand. No. 641,372. Dated Jan. 16, 1900. This truss is designed for the treatment of various forms of hernia, to minimize the discomfort and facilitate easy application and uniform pressure on the part or parts of the patient being treated, and a means for increasing or decreasing the pressure as circumstances require. The truss consists of a continuous flexible exterior covering, and a continuous hollow flexible tube which is adapted to be inflated. A stiffening and shaping plate occupies one side of the truss and pad, and is interposed between the inside tube and the exterior covering. By means of a belt and suitable connections these parts are properly supported.

Latest Market Reports.

SAN FRANCISCO, Jan. 25, 1900.

SILVER—Per oz., Troy: London, 27⅛d (standard ounce, 925 fine); New York, bar silver, 59⅝ cts. (1000 fine); San Francisco, 59⅞; Mexican dollars, 48½c.

COPPER. — New York, Lake, $16.50; electrolytic, $16.00; casting, $16.12½; St. Louis, $16@16.25; San Francisco, 17¼@18. Mill Copper plates, 23½c; bars, 25½@27c.

LEAD.—New York, $4.70; St. Louis, $4.75; San Francisco, $4.75; pipe 7½, sheet 8½, bar 6½c. London, Soft Spanish Lead, £16 2s=4.43c per lb.

SPELTER. — New York, $4.55; St. Louis, $4.50; San Francisco, ton lots, 5½c; 100-lb lots, 6¼c.

ANTIMONY. — New York, 9¼c; San Francisco, 1000-lb lots, 10c; 300 to 500 lbs., 11@14c; 100-lb lots, 15@18c.

BABBITT METAL.— San Francisco, No. 3, 6½c.

IRON. — Pittsburg, American soft, $25.25; Scotch, $26.50; San Francisco, bar, per lb., 3½c.

STEEL.—San Francisco, bar, 12c to 20c per lb.

QUICKSILVER. — New York, $52.25; London, £9 14s; San Francisco, local, $52 ℔ flask of 76½ lbs.; export, $47.50.

PLATINUM.—San Francisco, crude, $14 ℔ oz.; manufactured, $19@22.

FERRO-MANGANESE. — San Francisco, ℔ ton, $30.

ZINC.—San Francisco, 5¾; slab, 6½c; bar, 8.

ASSAY LITHARGE.—San Francisco, 10c ℔ lb.

TIN.—New York, pig, $27.50; San Francisco, $29; bar tin, ℔ lb, 35c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 40c to 50c.

NICKEL.—New York, 40@45c ℔ lb.

BISMUTH.—New York, ℔ lb., $1.80 50-lb lots; San Francisco, $2.50 to $3 lb lots.

CANDLES.—Granite 6s, 16 oz.,40s., 11½c; 14 oz., 40s., 10½c.

FERRO-TUNGSTEN.—New York, 60c; San Francisco, 75c (60%).

MAGNESIUM.—New York, $3.50 ℔ lb.; San Francisco, $4.50.

TUNGSTEN.—New York, ℔ lb., 75c; San Francisco, 90c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

COAL. — San Francisco coast, yard prices: Wellington, $8; Seattle, $7; Coos Bay, $5; Southfield, $7.50. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.50; Scotch, $8; Cumberland, $9; Cannel, $9.50; Welsh Anthracite, $12.50; Rock Springs' $10.05; Colorado Anthracite, $14.50.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 34@36c ℔ lb.; carloads, 29@30c; in 10-lb. tins, 40c; sulphuric acid, 1¼c ℔ lb. 66% B; soda ash, $1.60 ℔ 100 lbs. 58%; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5½@6c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@2¾c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, strictly pure, boiled, bbl., 66c; cs., 71c; raw, bbl., 64c; cs., 69c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 61c; cs., 66c; raw, bbl., 59c; cs., 64c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 20c; Astral, 20c; Star, 20c; Eocene, 22c; Extra Star, 24c; Elaine, 25c; Water White, bulk, in tanks, 14c; Mineral Seal, iron bbls., 21c; wooden bbls., 23½c; cs., 26c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 55c; cs., 60c; No. 1 bbl., 45c; cs., 50c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 65c; No. 1 bbl., 52½c; cs., 57½c.

SITUATIONS WANTED.

A YOUNG MAN WITH SEVERAL YEARS' practical experience in drift and hydraulic mining, especially hydraulic elevating, is open for engagement to manage or superintend works of this kind. Reference best in the State. Address J., care of Mining and Scientific Press.

Mining Engineer and Metallurgist, technically educated, with fifteen years of practical experience, is open for a new engagement as expert or superintendent. Specialty the treatment of rebellious silver and gold ores. Experienced in designing, building and running reduction works. Speaks and writes Spanish fluently. Address ALPHONSE BENO, P. O. Box 814, City of Mexico.

Position Wanted

By Experienced Metallurgist and Mining Engineer, preferable in charge of a cyanide plant or as chemist and assayer. Thoroughly familiar with all processes for gold extraction. Technical graduate. Best of references. Salary moderate. Address W. C. A., care this paper.

WANTED.

WANTED—A Second-Hand White Howell Roaster, also a Revolving Drier.

Must be in good repair. Address ARTHUR HENDEY, Agent, Copper Chief Mining Company, Jerome, Arizona.

WANTED.—Party with Capital to Develop Good Quartz Claim.

Has 40-foot shaft; lead 4 feet; free gold. Address ELMER BONNER, Kings River P. O., Fresno Co., Cal

Wanted.—Foreman for Twenty-Stamp Mill.

One hundred and fifty dollars per month and board. Address THE WM. HAMILTON MFG. CO., 316 S. Euclid Ave., Oak Park, Illinois.

STOCKHOLDERS' MEETING.

Notice of Stockholders' Meeting of the Union Hill Consolidated Mines.

In accordance with a resolution passed by the Board of Directors of the Union Hill Consolidated Mines, a meeting of the Stockholders of this Company will be held at 11 o'clock in the forenoon on Tuesday, the 27th day of February, 1900, at its principal office, 320 Sansome St., room 24, San Francisco, California, to consider and vote upon the proposition to increase the Capital Stock of this Company to four hundred thousand ($400,000) dollars in 400,000 shares at the par value of One Dollar each.

JOSEPH H. MOOSER, Secretary.

Dated San Francisco, January 15th, 1900.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from J. F. Cowdery, in the Lucky Point Mine, near St. Louis, Sierra Co., to deposit tailings in a worked-out pit; from Chas. S. Diesem, in the Riffle Point Claim, at Grass Flat, Sierra Co., to deposit tailings in Grass Flat Ravine; from Morris J. Williams, in the Weeds Point Mine near Camptonville, Yuba Co., to deposit tailings in a ravine; and from E. A. Moody, in the Inskip Placer Mine, at Gold Run, Placer Co., to deposit tailings in Squires Ravine, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on January 29, 1900, at 1:30 P. M.

"SMOOTH ON" CASTINGS.

An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work, applied by mixing with water; hardens quickly and expands in hardening. When hard it will with stand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

NO. 3 LAMP.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

MINERS' POCKETBOOK:
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G W. Lock. 472 pages, illustrated, flexible leather.....$5

THE METALLURGY OF GOLD:
By M. Eissler. Profusely illustrated.....$5

QUARTZ OPERATOR'S HANDBOOK:
By P. M. Randall.....$2

CYANIDE PROCESS:
Practical Notes on; Bosqui.....$2 50

CYANIDE PROCESSES FOR GOLD AND SILVER ORES:
By E. B. Wilson E. M.....$1 50

PROSPECTOR'S FIELD BOOK AND GUIDE:
4th edition. just out. By H. S. Osborn.....$1 50

PRACTICAL HYDRAULICS:
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall.....$2

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER:
Second edition; Guido Kustel, M. E.; 156 pages, with illustrations of furnaces, supplements and working apparatus.....$3

PRACTICAL TREATISE ON HYDRAULIC MINING:
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, etc.....$5

MINERALOGY:
Brush & Penfield, revised edition.....$4
Dana, New System.....$12 50
Dana, Text Book.....$4
Dana, Mineralogy and Petrography, 12th edition.....$2

HYDRAULIC AND PLACER MINING:
E. B. Wilson.....$2

TUNNELING:
Blasting, Timbering, Air Drilling, etc.; 1000 illustrations; Drinker, 3rd edition.....$25

ALLOYS:
Thurston, 2nd edition.....$2 50

ASSAYING:
Furman, 4th edition.....$3

LIEBER'S CODE:
Bound in leather.....$3

METALLURGY:
Eggleston, Silver, Gold and Mercury, 2 vols.$15

CHLORINATION PROCESS:
E. B. Wilson.....$1 50

GOLD ORES:
Treatment of; O'Driscoll.....$2

HIGH EXPLOSIVES:
Eissler.....$4

HYDRAULIC GOLD MINING:
Kirkpatrick.....$1

MINERALS:
"How to Study Them," Dana, 2nd edition. $1 50
Dana, American locality of mineral, 6th edition.....$1

SKELETON MINING REPORT:
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid.....50c

GEOLOGY:
Emmons.....$1 50
Le Conte, revised edition.....$4
Dana, 4th edition.....$5

If you do not find what you want in above list send for catalogue and price list, sent postpaid to any address. **Book Department Mining and Scientific Press, 330 Market street, San Francisco, Cal.**

Aaron's Assaying, PARTS II and III.

THIRD EDITION --- REVISED AND REWRITTEN.

The Third Edition of Parts II and III of this great work on assaying is now ready; new type; new illustrations; new matter; better than ever; reduced in price to $1.50 postpaid to any part of America. The practical character of this book has made it the favorite everywhere in the mining world among men who want such a manual on assaying.

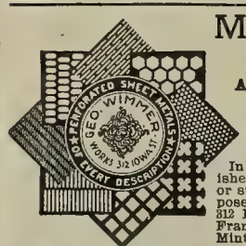
An Extraordinary offer! $6, *for a short time only.*



We make this offer so as to put **The Little Alaska Gold Washer** into every mining camp in this country. **Don't fail** to take advantage of it; it will save you **time, labor** and **money.** It will save its cost in a **few days. Just** the washer for Cape Nome. **Just** the washer for the poor man, who has not the money to put in expensive machinery. It will do the work of **10 men** with gold pans. **Just** the washer for the prospector; it weighs only 7½ **lbs**; taken apart it takes up no more room than the gold pan. **Don't wait; order at once.** As we say, it is only for a short time. RUSSELL & KINSEY, 204 So. Broadway, Los Angeles, Cal. *When ordering please mention this paper.*

PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO'S PATENT AGENCY.

330 Market Street, San Francisco, Cal.

QUARTZ SCREENS

The above illustration shows the method of holding and sighting BRUNTON'S PAT. POCKET MINE TRANSIT, when taking courses or horizontal angles. The construction is such as to permit of simultaneous sighting and reading. No tripod or Jacob's staff is necessary, and an operator, after becoming accustomed to its uses, can take the Transit from his pocket, take a reading and replace the instrument before a sighting compass can be placed. The most accurate and reliable pocket instrument on the market. Send for illustrated Catalogue B to

A MODERN COPPER SMELTER (ROUND FORM.)

THE COLORADO IRON WORKS CO.,

Established 1860. DENVER, COLO.

MANUFACTURERS OF

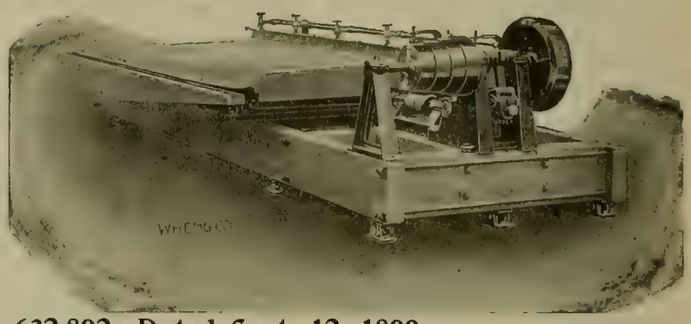
Smelting Furnaces and Equipments

For the Treatment of

Gold, Silver, Lead, Copper and Pyritic Ores.

THIS CLASS OF WORK IS A SPECIALTY WITH US.

We also manufacture all kinds of Ore Milling Equipments for Amalgamation, Concentration, Cyanide and Chlorination Processes.



(SEE PAGE 109.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

We have reports from mills employing Cammett concentrators for the treatment of ores containing galena, iron sulphide and zinc blende, that they are regularly producing on each table three distinct concentrates—one of galena, one of iron sulphide and one of zinc blende, each of which is commercially clean.

Practical experience with the Cammett concentrator proves that it **saves** and **delivers** into the **concentrates box** slimes so fine that to prevent them from being lost from the **concentrates box** it is necessary to provide several additional overflow tanks.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

ASSESSMENT NOTICES.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of December, 1899, an assessment (No. 22) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, No. 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of January, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 27th day of January, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, No. 214 Pine street, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment (No. 22) has been postponed to THURSDAY, the 1st day of February, 1900, and the day of sale from the 27th day of January, 1900, to SATURDAY, the 17th day of February, 1900.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office, Room 31, No. 214 Pine street. San Francisco. California.

SOUTH PALOMA GOLD MINING COMPANY, Limited.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Directors, held on the 6th day of December, 1899, an assessment (No. 1) of six-tenths (6-10) of a cent per share was levied upon the capital stock of the corporation, payable immediately to the secretary, John F. Barnett, at Room 22, No. 222 Sansome St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of February, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on the 19th day of February, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

JOHN F. BARNETT, Secretary.

Room 22, No. 222 Sansome St., San Francisco, Cal.

QUINCY MINING AND WATER COMPANY.—Location of principal place of business, San Francisco, California; location of works, Spanish Ranch, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of January, 1900, an assessment (No. 2) of forty cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 439 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of February, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

THOMAS QUIGLEY, Secretary.

Office—No. 439 California street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of January, 1900, an assessment (No. 10) of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of February, 1900, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

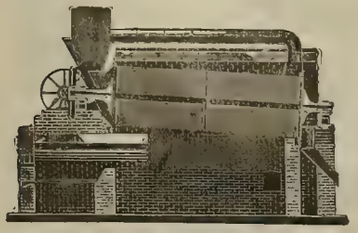
By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco. California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of January, 1900, an assessment (No. 22) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.



Any stock upon which this assessment shall remain unpaid on the 27th day of February, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 19th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

SIGHT FEED LUBRICATORS.

Senior. Joker. Junior. Mars. Banner. Oil Pump. Spray Feed.

If you want practical and reliable cups, use "The Lunkenheimer;" they satisfy the most exacting. Specify "Lunkenheimer" make. In stock by dealers everywhere.

Why Detroit Lubricators Should Be Preferred.

In addition to their many other good qualities, the Detroit Lubricators are made extra strong and heavy, each one being tested at a pressure of 300 lbs. to the square inch before it is allowed to leave the factory. This is probably twice as high a pressure as they will ever have to work under, so they are very durable and longlived, and, unless injured by accident, will not require any repairs for years. For this reason, they are particularly well adapted to users in the Rocky Mountain district and on the Pacific Coast, where it is expensive and inconvenient to get repairs. Our catalogue showing our different styles of sight feed lubricators, glass and brass oilers, oil pumps, oiling devices, etc., will be sent on application.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

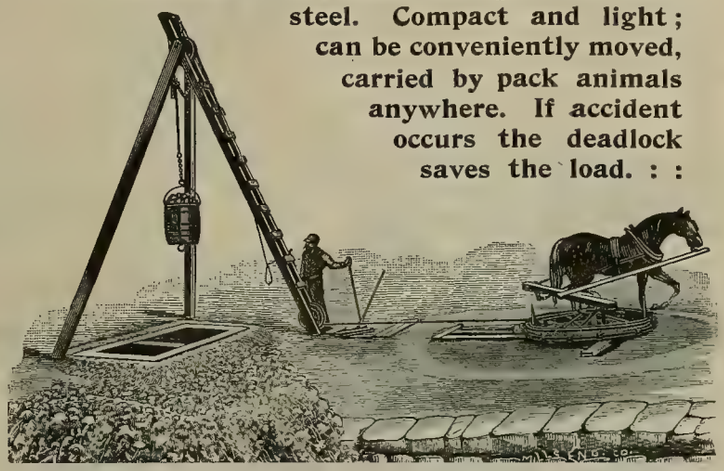
It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.



For any information regarding Frue Vanner or Belts, call on or address

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.

(Successor to Adams & Carter.) 132 MARKET STREET, ROOM 15, SAN FRANCISCO.

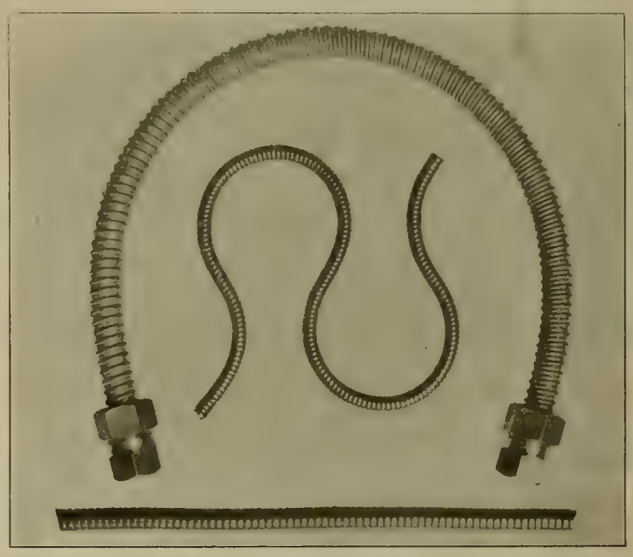
Clays Commercially Considered.

Clays in general commercial use may be divided into two classes: the fictile, a moulding or potter's clay, from which is manufactured porcelain and general pottery, and the refractory clays from which are produced firebrick, etc. Clays originate from the decomposition of feldspathic rocks, such as granites, gneisses and porphyries. These rocks are silicates of alumina, potash, soda, lime, etc. Due to exposure to the action of carbonic acid and water, they shortly lose their potash and soda, or alkaline ingredients, with some of their silica absorbing water meanwhile and being ultimately converted into kaolin, from which the finer grades of porcelain ware are manufactured. Pottery clays, suitable for the manufacture of common clay wares, abound. An almost invariable accompaniment of clay is free silica, or fine quartz, which can hardly be considered as anything but a dilutant of clay. For the potter's purposes, rich or "fat" clays have to be mixed with fine quartz. By rich or fat clays is meant those containing a high per centum of alumina. The lean clay is so called because of its low carriage of that metal. If the clay be too fat, the product manufactured will be liable to crack when subjected to heat. Here the skill of the potter is called into play. He must have a perfect clay to attain a perfect result, such as a rich plastic clay, which will admit of the admixture of considerable fine quartz. Fat clays shrink most from heat. The color of the glazes seen on potter's ware originate from the use of various coloring oxide metals, such as lead, manganese, copper, uranium, etc. A black clay when burned turns white, its color being due to organic matter. A white clay converted into a brick turns red because of the presence of oxide of iron in the clay. The only difference between the refractory and other clays is the freedom of the former from fluxing materials such as potash, soda, lime and iron. The presence of two or three per cent of these fluxes affects its heat resisting properties.

A Gasoline Mine Locomotive.



Steam locomotives, electric locomotives, compressed air locomotives, for mine work, have all been illustrated and described on this page, and, not to be behind, gasoline comes forward with its claim for public attention. The accompanying illustration is of a gasoline mine locomotive, built by the Prouty Motor Co. of Chicago. It is of compact design and will haul up to thirty tons; it is 7 feet long over the frame, 54 inches high from top of rail to top of motor and is made any gauge from 30 inches and over; it is equipped with a 25 H. P. engine and has a total weight of about 10,000 pounds; it is geared to reach a speed of about six miles an hour. The makers say that the danger of explosion of the gasoline tank is entirely eliminated by making it very strong, and that the tanks are tested to a pressure of 3000 pounds to the square inch. They claim to have overcome all possible objections to the use of the locomotive and to have so constructed the machine that it is practically "fool proof."

A Gasoline Mine Locomotive.

Flexible Metallic Tubing.

The accompanying illustration shows a new form of flexible metallic tubing, which should be a boon to all who have experienced the annoyances and losses in using ordinary hose. This metallic tubing is guaranteed by the manufacturers to stand steam pressure up to 300 pounds to the square inch. This new style of tubing is made from hardened bronze and steel tapes. The bronze is used particularly for high steam pressures, while the steel is used for water, compressed air, oils, gas, etc. There is no element of experiment about this tubing, there being over 2,000,000 feet of it in actual use. It is unaffected by climatic changes, is cheap and durable, and practically indestructible. Couplings are easily applied to it, being screwed right on the outside of the hose, thus giving the full area of the internal diameter of the tubing for the passage of fluids. For fire hydrant connections, suction hose for pumping, air drill hose in quarries and mines, testing special machinery, and numerous other purposes, it is considered valuable. This tubing, both in steel and bronze, is carried in stock by the Compressed Air Machinery Co., 11–13 First street, San Francisco, Cal.

Flexible Metallic Tubing.

Manufacture of Nickel Steel.

Nickel steel is cast in ingots weighing from 50 to 100 tons, requiring the charge of two or three furnaces to fill the ingot mould. The stock from which the steel is made is metal of known purity—wash metal, pig iron, pigs of ferromanganese, scrap from previous heats, crop ends from forgings, lathe and planer chips from machine shops, and finally nickel, the latter added after the charge is melted and just before casting, as the oxide or metallic nickel unites with silicates in the slag, involving loss. The smaller losses occur with metallic nickel shot, used for alloys containing over 5% nickel. The usual method is to use oxide of nickel mixed with charcoal and lime, made plastic with water, moulded into cubical bricks and dried thoroughly. When added to the bath of steel, at a white heat, the carbon of the mixture reduces nickel oxide to metallic nickel, lime taking up any silica that may be in the adjacent charge, thus insuring immediate alloy and preventing loss of nickel by formation of silicate of lime. The furnaces are of the open hearth type, consisting of an oblong, horizontal metal pan lined with refractory brick and clay, vertical sides provided with doors front and back, ports at the ends through which combustible gases enter and exit after burning. An arched roof completes the structure, the capacity of which varies from 20 to 50 tons. The method of manufacture does not differ much from that practised with other steels.

ARIZONA should be given statehood at this session of Congress. It has the population, resources and requirements that go to make a commonwealth, and is justly entitled to be the forty-sixth star on the flag.

THE corner in copper and the recent drop is said to have caused a loss of nearly $90,000,000 in Boston alone. While the disaster is doubtless exaggerated, it is manifest that New England investors and speculators are badly hurt, and, probably, many of them decry "mining," not noting the difference between working the mine and working the street. The episode is so usual as to attract little notice.

THE California State Miners' Association, through its Executive Committee, has decided to make active attempt to get the Mineral Lands bill through Congress at this session. It is a measure of present necessity, and one that deserves immediate affirmative action by the national Legislature that the mineral area of California may be preserved from further corporate absorption. A brief document presenting cogent and unanswerable reasons for its passage is being prepared and will be furnished each member of Congress, some of whom, being new members, may not know the facts connected with this long-continued effort for justice to the miner and prospector in California.

AN investor—especially a British investor—usually wants a "going" mine, a property that is developed and profitably producing. In that case he can not expect to get it for the price of a prospect, though that is often just what he does expect. The owner of such a property generally knows what it is worth a little better than any one else, and doesn't care to sell for its actual value. The actual worth of a mine—"going" or otherwise—is difficult to determine. Every influence tends to put the price too high. Experience in this case is a good guide, and, though like the stern lights of a vessel, it illumines only the water over which it has passed, yet if a man will not consider "experience" to be only another name for a history of mistakes, but a valuable record of what successful men have done, he will note that Lane, Hayward, Haggin, Daly, Moffitt, Hearst, Jones, Fair and a score of other millionaire miners made their money largely by buying prospects or partly developed mines, spent money on them, rejected the blanks, pushed the prizes and realized handsomely on the total investment. Mines that are susceptible of being thus made are not extraordinarily plentiful; every prospect will not make a mine, but a prospect wisely selected and properly handled is likely to be satisfactory. What these men have done is a good track to follow in.

Buying Mining Machinery.

In these advanced days it is the fault of no one but the miner himself if he has worked off on him machinery of any kind that he does not want, or that is not suitable. The elements of hurry, ignorance and credulity are pretty well eliminated from the problem of purchasing mining machinery, and there are plenty of reputable concerns manufacturing mining machinery that would not knowingly let any piece of apparatus out of their establishments unless it was just what they represented, and, so far as they could determine from specifications, was what was needed or desired for the work in hand. So that a miner can protect himself from the ignorance, or worse, of the manufacturer who doesn't understand his business, who wants to sell regardless of reputation, and who has no prestige to gain or maintain, by dealing with none but reputable concerns and by looking closely when proffered what may appear to be more than his money's worth. The miner must remember that he takes the most of the risk; that it is more economical in the long run, or the short run, to pay a little more and get good machinery than to buy rattletraps, poorly made and poorly adapted to his needs. Cheapness does not consist in what one pays, but in what he gets for what he pays. It sometimes happens that a miner or an investor will say, "I sunk so much money in mining," and believe it, when he should say, in truth, "I sunk so much money in poor machinery." Time was when a miner had to take what he could get and be thankful. But scientific mining has made great changes in this, and in no branch of industrial progress has there been greater advance than in the production of proper devices to aid the miner in his work, and mining machinery manufacturers now make possible and profitable mining work that was formerly out of the question. Mining machinery manufacturers are entitled to great credit for the skill and capital that turn out such quantities of improved devices, and it is as much a necessity to the modern miner to utilize modern machinery as any modern process of metallurgy. Many a mining plant is to-day clanking along at a loss, when, with the old machinery thrown in the scrap heap, and new, up-to-date appliances put in, there would be shown a profit.

Right here some reader will say, or think: "That's all very well, but I can't throw away my old machinery and buy better." That depends. If he is working for profit, anything that will tend toward economy is business to do. Economy is merely the judicious expenditure of money. It is economy sometimes to save five cents; another time it is economy to go in debt $10,000. We are not advising any miner to go in debt or buy machinery that he doesn't need, but we do advise him to get good machinery when he gets any, and if it be manifest to him that improved appliances will produce greater profit than the ancient devices he may now be using, then it were good business in mining or anything else to get such improved machinery. If a business—mining or any other industry—is worth doing at all, it is worth doing right.

South African Mining Machinery.

South African miners report that the Boers are working the Rand mines "after a fashion." Naturally they would get out all procurable, as gold furnishes the sinews of war, and, apart from its purchasing power, there would be a double satisfaction to the Boer in knowing that his enemy was furnishing the ammunition that compassed his own defeat. The recent reverses, or, indeed, the continuous defeat of the British, have at last caused a cessation of hopeful feeling among British holders of Rand mine shares, and it is now recalled with trepidation that Kruger prophesied last October that, if the British won, it would be "at a price that would stagger humanity." The British army and empire is pretty well staggered now, and the old Boer's assertion is further interpreted to mean that, in the event of a British march upon Pretoria, the Johannesburg gold mines will be destroyed, so far as it lies within the power of human ingenuity to wreak ruin among mine workings, and nearly $90,000,000 in machinery wrecked.

American miners who have had much to do with the Rand mines figure that, were that threat carried out, it would take three years to put the mines around Johannesburg in the condition they were just prior to the war. In this regard it is of interest to note that a considerable portion of the $90,000,000 machinery in and around the Johannesburg gold mines is of American manufacture, and it is of further interest to note that well-informed men say that the English plans of the South African gold mines and copies of all the machinery plans have been sent to American manufacturers of mining machinery, and that preliminary arrangements are being made to immediately duplicate a large part of the destroyed machinery, should it become manifest that the vengeance of the Boer against the Uitlander would make such duplication necessary.

An Indication of Growth.

The attention devoted to any industry by the press of the country is a good criterion of its importance. The mining industry of the United States, and particularly that part of the nation west of the hundredth meridian, is well represented. Noticeable is the increase in the number of journals devoted exclusively to mining. Time was, a few years ago, when this paper was the only one in all that vast region devoted to mining and metallurgy, and scientific advance therein. Now there are a score of mining publications. In general they are ably and honestly conducted, and in connection with mining journalism that is saying a good deal. Besides the journals specially devoted to the business of mining the daily and weekly newspapers are a great aid to legitimate mining. They spread broadcast the latest obtainable news, and if it is not always exact or authentic it is corrected or confirmed at the earliest opportunity, and many of the articles appearing in the city and country press would not be out of place in a strictly technical journal. There is, probably, no department of journalism in which there is more harmony and less detraction and effort at injurious rivalry. Every one engaged in the business of publishing a mining paper realizes that his publication must earn a good reputation and must continue to deserve public belief in its rectitude of intent. The mining public will forgive an honest mistake or a manifest inaccuracy, but will not condone any attempt at deception. The common phrase "an honest miner," is a deserved one; miners are honest, and quickly resent dishonesty in a paper or elsewhere. In connection with current publications may be mentioned weekly and monthly issues which deal largely with industries that have direct connection with mining: under this head would come the electrical journals, papers devoted to power, machinery, etc., which exceed in number even those devoted exclusively to mining. During the forty years of its uninterrupted and successful existence the MINING AND SCIENTIFIC PRESS has seen a large number of journals begin life devoted to the same general subject to which it was consecrated so long ago, and views with pleasure the pioneer path now so broadened and numerously traveled. The mining industry owes much to the mining journals of the country; they can be a help or a hindrance, and it is a duty they owe the mining public that the standard of success shall continue to be genuine and that none in the smallest degree betray whatever trust may be reposed in them.

Earth Backing in Masonry Dams.

The subject of earth backing for masonry dams is one of constant dispute by advocates and opponents, the latter claiming that the pressure is increased by the presence of earth because of saturation causing the earth to lose its consistency, and, being heavier than water, to press with additional force against the wall. The advocates argue that even granting that the earth becomes water soaked, that would not augment the pressure, as the two factors of which the pressure or thrust against the back of a retaining wall is made up are the weight of the retained material and the angle of repose which it naturally assumes. The majority seem inclined to favor the latter argument. Should the former prove to be sound engineering practise it must become a matter of immediate concern to such California and Colorado engineers as recommend the construction of purely earthen dams without masonry core walls.

Concentrates.

A TON of calcium carbide, made in England, costs $42.90.

IT is asserted that steel containing 12% of manganese can not be magnetized.

IN the last nine years Cripple Creek, Colo., has produced in gold $68,475,873.

MASSACHUSETTS laws require that capital stock subscribed shall all be paid in.

CRUDE petroleum added to the feed water is said to prevent boiler incrustation.

IN January, '96, platinum sold at $14 per oz. in New York City and 50s per oz. in London.

THE International Congress of Mining and Metallurgy will be held in Paris beginning June 18th, 1900.

A VALID mining location, lode or placer, at once withdraws from the public domain the land it covers.

THERE are in nearly all large cities manufacturers of artificial limbs. There are three in San Francisco.

AN injector forces water into a boiler because the area of the steam nozzle is greater than the area of the combining tube.

THE avoirdupois weight of a box of pure gold 5x8x4 inches would be 111.44 pounds; of gold dust, about two-thirds that amount.

PROBABLY the best commutator lubricant is heavy petroleum oil applied very sparingly with a cloth slightly moistened with the oil.

POTASSIUM CYANIDE begins instantly to decompose when exposed to the atmosphere, as is evinced by the smell of hydrocyanic acid.

THE description and illustrations of patents weekly published in this paper are official, being obtained direct from the U. S. Patent Office.

TIN ORE is found in various parts of Bolivia, S. A., and, concentrated, is exported therefrom to the probable amount of 300 tons per month.

THE concern furnishing the electrolytically formed seamless copper steam pipes is the Elmore Patent Copper Depositing Co., Ltd., Leeds, England.

TO MAKE a solution for a bichromate of potash battery, to a saturated solution of bichromate of potash, add slowly one-fifth its bulk of sulphuric acid.

DRY AMALGAMATION is by no means impracticable or impossible, but has not proved a commercial success, largely because cyaniding is a cheaper process.

IF a gauge be put under the bottom of a steam boiler, and the boiler be put in use, the gauge will show the pressure of the water plus the pressure of the steam.

POSEPNY'S "Treatise on the Genesis of Ore Deposits" will be found in the transactions of the Chicago meeting in 1893 of the American Institute of Mining Engineers.

COPPER sulphide tends to travel to the interior of lumps of ore in kernel roasting. Silver, on the contrary, concentrates to a perceptible degree on the outside of such lumps.

A 100 H. P. ENGINE should ordinarily develop about 70% of the indicated H. P. in electrical H. P. (746 watts each). A water tube grate bar is not considered successful or economical.

THE number of turns of wire in an electro-magnet may be learned in this way: Multiply the thickness of the coils by the length and divide the product by the squared diameter of the wire.

THE effect of a good covering for lines of steam pipe is to increase the efficiency, value and safety of the power, condensation being reduced, and breakage due to saturated steam being less liable.

CHEMICALLY pure potassium cyanide cost $1.50 per pound in 1877, half that in '78; in '79, 70 cents; from '90 to '95, 50 cents, and 98% can now be bought in carload lots for 28 cents per pound f. o. b.

A PERFECT vacuum is a perfect insulator. It is possible to exhaust a tube so perfectly that no electric machine can send a spark through the vacuous space, even when the space is only one centimeter.

AN American miner in the Klondike, British Columbia or elsewhere in British territory "can become a voter" there after a residence of three years by taking the oath of allegiance and becoming a British subject.

THIS paper never attempts the correction of mistakes however manifest, noticed in its contemporaries, being too busily engaged in trying to reduce to a minimum the possibility of similar errors in its own columns.

BY selection of men and care on their part, it is possible to work where the pressure of air is 50 pounds per square inch, but, with average conditions, the limit is 42 pounds, and the shift not more than four hours.

WOLFRAMITE, or tungstate of iron, is found associated with gold quartz in the Arivica district, Pima Co., Ariz. At Murray, Idaho, is a vein of tungstate of lime, or the species scheelite, alongside a vein of gold-bearing quartz.

A WHEEL as a whole does not go around the axle, although all of its parts revolve around the axle when it is running. The hub turns with the rim, and, although there is no change of relative position of parts of rim and hub, yet it may be truly said the rim goes around the hub, for every part of the rim is consecutively on every side of the hub.

STATE MINERALOGIST COOPER sends a bulletin (No. 16) just issued, on the genesis of petroleum and asphaltum in California, and says four other bulletins on oil, gas, petroleum and asphalt are expected to be shortly issued by the Bureau.

THE difference between limes and cements is that limes will set only in contact with dry air; for the setting of cement not only is the presence of dry air not necessary, but the best results obtain when the cement is kept wet or immersed in water.

PHOTOGRAPH PROOFS can be kept from fading by being dipped in a solution of two grains hyposulphite of soda (such as is found around a chlorination works) dissolved in five ounces water for ten minutes; then wash in changing water for 1½ hours.

A CHICAGO firm who sent a calendar handsome enough to justify a notice, writes that had they known this paper was going to give it a notice they would have printed more of them; for since the appearance of the notice the demand has exceeded the supply.

THE point of maximum density of fresh water is 39.2° F. The hottest sun's rays are not perceptible in water below a depth of 64 feet. Prof. Le Conte, in August, found the temperature of Lake Tahoe to be 39.2° at 1506 feet depth, 41° at 772 feet and 67° at the surface.

TO FIND the volume or contents of a barrel or cask of any form: add together 39 times the square of the bung diameter, 25 times the square of the head diameter, and 26 times the product of the diameters. Multiply the same by the length, and divide the product by 36,470 for U. S. gallons.

THE atomatic group in chemistry is a class of hydrocarbons, chiefly characterized by containing a group of six carbon atoms, in which, out of the twenty-four units of atomicity, eighteen are supposed to be saturated by union of carbon with carbon, leaving only six open to external saturation.

THE brass mine in South Dakota, the cheese mine in Australia, the deposit of terra cotta in North Carolina and the white gold worth $22.50 per oz. in Picacho, Cal., must yield in absurdity to the renewed story of the search for the lost "Pegleg" mine, between San Jacinto and Temecula, Cal.

TO FIND the horse power of a steam engine multiply the area of the piston in inches by the pressure of steam per square inch, then multiply the product by the speed of the piston in feet per minute, and divide by 33,000. This gives the theoretical horse power, but it leaves friction out of the account.

THE only known method of producing auric chloride perfectly free from acid salt is to decompose aurous chloride with water. When gold is heated in chlorine at atmospheric pressure, trichloride of gold is formed and volatilized at all temperatures above 180° C., up to and, probably, beyond 1100° C.

CHLORIDE OF ZINC is superior to copper as a disinfectant, but is more expensive, and, therefore, not so available, when large quantities are required. Corrosive sublimate—one part to a thousand parts of water—is an effective disinfectant, but a virulent poison, and to be handled with extraordinary care.

IF a circular piece of metal, 2½-inch diameter and of certain thickness, weighs ten pounds, a circular piece of the same metal, 5 inches in diameter and of the same thickness, will weigh forty pounds. Weights are proportionate as to areas. The area of the piece 5 inches in diameter is four times that of the one 2½ inches in diameter.

THE first mention of cyanide of potassium as a solvent of gold, so far as "Concentrates" knows, was in the American Journal of Science, Vol. XLI, for March, 1866, in which in the course of an article by Dr. Henry Wurtz, the author mentions that cyanide will dissolve gold from its ores. He also refers to dilute solution as being of advantage.

A METHOD of welding lead is as follows: The surfaces to be joined are carefully cleaned, and between them is placed thin layers of lead amalgam. On passing an ordinary soldering iron along the line of junction, the mercury of the amalgam is vaporized, and the lead, set free in an exceedingly divided state, fuses and unites the two surfaces together.

ELECTROID GAS is made from pure acetylene gas by dilution, is composed of acetylene with the admixture of inert matter and a proportion of oxygen, is perfectly white, said to be equal to 250-candle power, as against the average 17 C. P. of ordinary coal or water gas, and, so far as known, is used as an illuminant only in Hunmanby, Yorkshire, England.

WATER issuing from a nozzle with a pressure of 125 pounds to the square inch would be at a velocity of 8100 feet per minute: a nozzle $\frac{1}{16}$ inch in diameter at that pressure would discharge 10 cubic feet per hour. A jet or impact wheel of the Pelton type should be 6 inches diameter to run at 2800 revolutions per minute on a jet of that pressure and speed.

MOLYBDENUM is a soft metal, easily filed and polished, malleable when hot, does not scratch glass; specific gravity 9.01. Oxidized it is converted into molybdic acid, extremely volatile, and hence of value as a deoxidizing agent in manufacture of steel in place of manganese or aluminum, leaving no effect on the malleability or tempering properties of the steel.

WITH dry surfaces the hardest metals with smooth or polished surfaces have the least sliding friction when two surfaces of the same kind of metal are rubbed together. Hardened steel surfaces have the least friction of the metals most convenient for general use. Antimony on hard steel has a low per cent of friction, as has also nickel upon nickel, or nickel upon hard steel.

THE fastest steam craft afloat is the Turbinia, built at Newcastle, England, by C. A. Parsons. The boat is 100 feet over all, 9 feet beam, 44½ tons displacement, has three compound steam turbines, each driving a shaft with three propellers—nine propellers altogether, and having a speed of 34½ knots (37⅝ miles) per hour. The consumption of steam is figured at 14½ pounds per I. H. P. of the main engines.

A BANDSAW with pulleys 28 inches in diameter would obviously require different horse power according to speed and style of work. With a speed of 480 revolutions per minute, or 3520 lineal feet per minute, belt pulley 12 inches diameter, 3½ inches face, hand feed, motor belted to saw shaft, in ripping seasoned oak 3 inches thick, feed 2½ feet per minute, it would take 2.3 H. P.

WHERE a cannon ball is fired from a cannon in a horizontal position, and another cannon ball is dropped from the mouth of the same cannon at the moment of firing, the dropping ball will reach the earth first. Gravity is a constant force, unaffected by velocity horizontally, but the ball fired from the cannon points in a tangent to the earth's surface. The difference of time is, however, inappreciable.

THE genuineness of any precious stone may easily be proved, and a fraudulent gem exposed by immersion in a specially prepared liquid. Take, for instance, for the diamond, a double nitrate of silver and thallium mixed with warm water to the proper specific gravity, in which a genuine diamond's specific gravity will be instantly manifest when immersed. For lighter stones methylene iodide is used in a similar manner.

QUICKLIME contains 44 parts by weight of carbon dioxide, and 56 parts oxide of calcium. In slaking, 18 parts by weight of water unite with the 56 parts quicklime, making 74 parts calcic hydrate. Hydraulic lime contains 10% to 25% alumina. It differs from quicklime in that it hardens in water. A safe and durable hydraulic cement can be made from the slag from blast furnaces. It is of the same specific gravity as Portland cement—3.10.

CALIFORNIA oil is not readily susceptible to purification for lighting purposes because of its non-possession of a paraffine base. Petroleum distillates are purified by washing with sulphuric acid. The purer the acid and the lower the working temperature, the better the results. The action of sulphuric acid on petroleum is twofold: 1. Elimination and solution of impurities. 2. Oxidation of the heavier portions.

THE Pœtsch system of sinking through sand is the transformation of the ground into a block of ice. At Onnanig, France, the ground had to be frozen for a depth of 300 feet, but a shaft 16 feet in diameter was successfully sunk. Holes are bored and tubes inserted through which is sent a solution of calcium chloride at 20° C. below zero. The system is very expensive, the operation of the plant alone costing $40 per day.

THE Supreme Court of Colorado—Belmont M. & M. Co. vs. Costigan, 42 P. R., 647—has held that where, in consideration of extension of time to pay purchase money of mining property, the buyer gives notes secured by deed of trust on the property, and agrees with the seller that he will, till payment of the debt, work the mine in mine fashion, the measure of damages for breach of such contract, for which the seller only has a cause of action, is the injury to the security.

ARGUMENTS that tellurium is not an elementary substance are principally four: (1) Tellurium precipitated and dried in a current of inert gas gives higher values for the atomic weight than when sublimed in hydrogen. (2) The properties and composition of the dibromide. (3) The varying results obtained on attempting the synthesis of the dioxide, the basic sulphate, and certain metallic tellurides. (4) The behavior of tellurous and telluric acid solutions toward hydrogen sulphide.

THIS paper solicits contributions of a practical or technical nature, its columns being considered as a medium of interchange of information of common benefit and value. "Everybody is wiser than anybody," and to many men will occur something in mining, engineering, metallurgical or mechanical work, an account of which would be of interest and value to their fellow workers in the mining world. Such details are desired, and when accompanied by sketches or photos for engraving are of additional value.

WHEN mercury "flours" it divides into minute globules; upon such subdivision the globules become so coated as to prevent their reunion: this is "sickening." Flouring is favorable to amalgamation if the small particles of mercury alloy with the gold before being covered with foreign substance, and so "sickened." Grease, talcose, clay, varnish, or new screens will "sicken" floured mercury. Condenser water often acts as a sickener of mercury, though some mill men use quicklime as a solvent and neutralizer. How to restore the mercury to its pristine usefulness has been repeatedly published herein.

Dredging for Gold.

NUMBER II.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by THEO. F. VAN WAGENEN, E. M.

The drive weight can advantageously be of the nature of a heavy collar to the drill stem—with ears to hang it up on hooks from the rig when desired—capable of being rapidly attached to and released from the stem. The latter is provided at frequent intervals with bevel shoulders. The drive weight is in two parts and dressed inside with bevelled projections to engage the shoulders on the stem, and the two parts connected with bolts. When not driving, the collar is attached to the stem high enough up to avoid striking, or else it is hung up. When driving, it is dropped on the stem sufficiently to effect the blow. Except when passing through tailings or muck (in which drilling is unnecessary) the drill should never be much in advance of the shoe, or material will come in from the outside and the sample be vitiated. The drillings as hoisted by the pump are emptied into a wooden box about 4 feet square and 1 foot deep, and from there as convenient shovelled into a small portable rocker and washed.

When bedrock is reached, it should be penetrated until real solid material is obtained (which means from 3 to 18 inches according to the rock). By so doing it is possible to clean the hole absolutely of gold, as the water will be shut out, and valuable information is obtained as to how far into the bedrock the digging mechanism of the dredger can be fairly expected to cut. Of course a careful log must be kept of each hole, giving the depth at which the various formations—tailings, loam, gravel, bedrock, etc.—are cut, with proper memoranda of anything else encountered, such as logs, drains, drifts, etc.

Mercury is used in the rocker. The globule is emptied into a pan, and after being washed is transferred into a bottle, which is given the number of the hole. I have found it convenient to use a bottle about 2½ inches long and ¾ inch diameter, with wide neck. Later, the quick is squeezed, the resulting pellet of amalgam retorted in a porcelain capsule over an alcohol lamp, the retort fused with silver on charcoal before the blowpipe, parted in the porcelain capsule and brightened, and finally collected again into a button with the blowpipe and weighed. Of course, if an assay office is available it is better to send the retort there. But in ground averaging 20 cents per cubic yard or better, and using a pipe 6 inches or more in diameter, and with holes 20 feet or more in depth, the button of gold will be large enough to be manipulated without difficulty as indicated. Once obtained, each button can be conveniently put into a little homeopathic bottle properly labelled with the number of the hole, weight of the button and calculated yield per cubic yard. A wisp of cotton stuffed into the bottle before corking keeps the pellet in one place on the bottom and gives a white background against which it shows up well.

When a block of ground is to be sampled, a surveyor should run lines across it about 100 feet apart, and place pegs every 100 feet on each line. Excluding the outside pegs, which will be on the rim, the others will represent holes to be sunk, and there will be about four to an acre or eighty to a twenty-acre claim. The holes should not be in lines up and down the creek, but should be rigidly so across it. And when the logs of all are compiled and maps, sections and profiles made therefrom, as much will be known of the value of the property, and as much can be decided of the methods to be used to realize those values, as in the case of a lode whose ore body is entirely blocked out by shafts, levels and winzes, and whose stopes have been thoroughly sampled.

The cost of the operation will be as follows, under the assumptions that the horse and drill are purchased and regarded as an investment and that the holes will average 25 feet deep: Two stout men at $3 each and a boy at $1 will operate the machine. The horse feed will cost 50 cents. The rocker man, who will be a working superintendent, will earn $4. Blacksmithing, repairs and contingencies, $3.50. Total, $15 per day. Such a crew, well managed, will sink two holes of 25 feet depth each in three days, including withdrawals of pipe and movings. That is, 50 feet of holes for $45, or 90 cents per foot. At four holes per acre the cost is $90 per acre, or $1800 per claim of twenty acres. The drill, horse and harness can be bought most anywhere in the west at $750, and will sink 1000 25-foot holes before showing much wear and tear. The cost of the prospecting by this method is very cheap. Any concern that attempts to get along without it simply invites ruin, and deserves no sympathy when it comes.

THE DREDGER.—There are three methods of digging, viz.: by suction, with a single scoop or bucket, and with the elevator or endless chain of buckets. Each has its proper field.

The suction type is best where there is plenty of water and a very small proportion of boulders over 3 to 4 inches in diameter. It is an admirable type for use on rivers like the Snake where there are practically no boulders, but would not do for the Rogue or Klamath, where there are plenty. It will clean up well on micaceous granite bedrock, but should never be employed on slate, serpentine, porphyry or feldspathic granite bedrock. Speaking generally, it is not the best type for mountain streams or channels with grades of 15 feet or over per mile, but is well adapted for lake deposits and reaches of quiet water with grades of 10 feet per mile or less.

The single scoop type has never yet to my knowledge been successfully operated as a gold-saving machine, but as one is being put in during this winter by a firm of careful operators at Idaho City, Idaho, more will be known on the subject in another twelve months. It has been believed that no dipper or clamshell bucket could be devised that would close tight enough under or around its load to stop leakage, in which event gold is certain to be lost. It is also believed that this type of digger stirs up the water and the gravel much more than either of the others, and comparative quiet in the operation is thought to be an essential, for otherwise many of the fine particles of gold will be tossed about and lost in the eddies. The clam shell certainly cannot clean bedrock, and it has been urged that the dipper will not prove a much better tool for that work. On the other hand, with this type a very large bite can be taken out of the gravel at each trip, the load can be elevated to the necessary height for sluicing at one operation, and the washing can, if desired, be conducted on an independent scow. All these are very important considerations and may overbalance the alleged deficiencies in many cases. It is conceded that the single dipper will dislodge and lift rocks and snags that will stall an endless chain. But this may not always be a distinct advantage, for it will sometimes induce the exploration of ground that should be let severely alone, or else be attacked with steam derricks.

The endless chain elevator will, at a pinch, handle rocks (rounded or angular) about 3 feet long, 18 inches wide and 1 foot thick, but should not be given heavier work, and this duty can only be expected of machines of stoutest design. Most elevator dredgers will be stalled with a rock over 18 inches, largest dimension. It will clean soft and even bedrock as well as the suction type and much better than the latter when the bedrock is full of seams or humps, and when the upper few inches of it must be dug away to get the gold that has settled in the cracks. It will not—as at present constructed—elevate the material high enough to wash it, without the use of a second lift.

From the digger the material goes to the grizzly, which screens out as much rock as may be deemed advisable by the designer, who, of course, should know the proportions of rock of various size in the ground in order to design wisely. There is much room for improvement in this department of the gold dredger. The revolving grizzly, especially when supplemented by one or more outside screens for further separation of the smaller pebbles, is a costly apparatus, consumes too much power when it is given a heavy duty, and does very little effective work on other occasions. Yet it is not easy to suggest anything better. It is a most important part of the machine, but, if given the duty of disposing of the bulk of the material, it should be supplemented by a conveyor, and then the power consumed is well employed. If it has to deal with only 5% or 10% of the stuff dug, the huge and expensive iron barrel should be discarded in favor of a simpler device.

For a second elevation of the material, experience has shown that a second elevator will not work. The centrifugal pump is the best machine so far devised. These, when properly lined and when made of the correct size for the work expected of them, answer very well. They are large consumers of power if compelled to effect a lift of over 15 feet. Elevation by water jet propelled by pumps proved, as might have been expected, a lamentable failure, on account of the enormous amount of power required, and all conveying devices so far attempted have produced such a serious elevation of the center of gravity of the boat that its stability is threatened. However, it seems to me that when a second lift of the material cannot be avoided the problem will ultimately be solved by using conveyors and increasing the stability of the boat by broadening its beam. One of the weak points of the centrifugal pump is the large proportion of water it requires, for water is a scarce commodity at many a good gravel deposit. Besides, a large volume of water compels the adoption of a broad and long sluice, lest the gold have no chance to settle in the riffles. These long sluices are expensive, difficult to maintain in equilibrium and difficult to clean up. The system of catching the gold on tables or matting is a good one whenever it can be employed, but it is only at its best as economical when 75% and over of the material can be handled by the grizzly. There are comparatively few situations where this can be done.

Typical Mountain Dredging Proposition.

Bridge Across Mountain Valley Filled With Tailings.

The dimensions of the sluice, the grade upon which it is set, and its length, must, of course, depend upon the amount of gravel to be put through it, the proportion of boulders to sand, and the proportion of black sand. To design one correctly without fairly accurate information of these points is consequently an impossibility. Yet few dredgers have a sluice built after consideration of these matters. Small wonder, therefore, that so few are saving even 50% of the gold which at heavy expense is put into them. But it was not so many years ago that stamp mills and other reduction works were built without consideration of the physical and chemical qualities of the ores to be handled by them, and perhaps before gold dredging shall have attained the stable condition as an industry that ore reduction now has, it must register as large a proportion of failures as the latter has.

The problem of delivering the tailings far enough away from the dredger so that they cannot flow back under it, when there is a limited amount of water, is a very serious one and has only been partially solved by the various devices known as stackers. When there is a fair grade in the channel being worked, say 25 feet per mile or more, the difficulty can be partially overcome by working down stream instead of up, but if the proportion of sand in the entire mass dug exceeds 50% brush dams must be employed, and these involve considerable expense and constant attention. Of course, if the water supply is abundant and the grade of the channel fair the machine should work up stream, and the debris will take care of it-

self or is easily managed. A portable dam consisting of wooden or metal frames holding perforated metal screens has been suggested in this connection and will be experimented with during the coming summer. It is the idea of the inventor that several lines of these thrown across the channel parallel to each other and 10 to 20 feet apart will arrest nearly all of the debris, and that each line will be recoverable and may be reset as the boat advances.

For holding the boat to its work, anchors or guy ropes will, of course, suffice when the gravel is lifted by suction or when shallow or soft material is to be dug. But in all other cases the spud is the only successful apparatus so far devised. The elevated mooring frame has no value, as the boat rocks under it and the steel ropes will not stand the strain unless inordinately heavy, when they become unmanageable. Spuds are now set in pairs, one being used to walk with and the other to hold. The latter is preferably of two sticks each 18″x36″, clamped together so as to make a beam 18″x72″, beveled at the bottom to a chisel edge and steel shod.

After many years experimenting dredging in the Snake river has been made a commercial success, but this has been accomplished by the discovery that the bulk of the values in the bed of that river are in the black sand rather than in the visible gold. For a distance of 250 miles, as it passes through southern Idaho, this river carries payable value and can be worked except where the stream travels in rapids or over falls. The material is brought up by suction pipes, screened of all the pebbles and the balance run over amalgamated copper plates, exactly as in the stamp mill, and considerable free gold caught. The tailings are then passed through ordinary sluice boxes in which the heavy black sand is readily caught. This latter is shipped to the smelters and constitute a very profitable product. There is room for nearly 200 of these machines on the river.

They are built at light expense, are operated very economically and are proving about as certain and profitable an investment as is to be found. In operating them the same ground is worked season after season with no diminution of results, for it is now well recognized that the Snake river gold comes from the immense lava bed through which the stream has carved its way, and the metal is being made free by erosion continually. It is certain that this source of gold will be very heavily drawn upon as soon as these facts become generally known. It is probable that certain stretches of the Colorado river and of the upper Missouri present similar opportunities and nearly identical conditions.

The channels of the Klamath and Rogue rivers are at numerous points extremely rich in gold, but present wholly different conditions and must be attacked by other methods. I have not heard of any successful dredging enterprises in these regions as yet, though there have been several attempts, not preceded, however, by any careful study of the conditions under which operations must be carried on. Certain Colorado streams are also rich in gold, but their channels are also (almost without exception) so extensively sown with large boulders that success is well nigh hopeless. The same is largely the case in Montana—in fact, in all regions where the altitude is high the bulk of the streams will be found to possess a fall of 30 to 40 feet per mile. This, except in favored spots, means a rough, hard bedrock, very difficult to scrape and clean and generally plentifully covered with boulders and fragments of country rock from the adjoining hills.

There exists, however, in the West such a very large area of good dredging land, where the gravel is rich and the physical conditions favorable, that engineers sent to report on such enterprises should unhesitatingly turn down every one that presents features at all doubtful. A client should not be advised to take chances in a new business when none are necessary; or, at least, he should be candidly informed of the dangers ahead if he insists upon attacking a risky problem. And investors will do well if they decline to embark upon a dredging venture upon the strength only of proven values in the land, or with a machine that has no more recommendation than that it has succeeded somewhere else; for there are many thousand acres of territory in the West that can be shown to carry $1 per yard and upwards and yet cannot be worked by any known device or method at a less cost than $5 per yard, and there are machines that will work well under one set of conditions and break down utterly in all others.

Unusual Electrical Display.

A few nights ago, while a doctor of Oroville was going to Palermo, he passed the electric wire that carries the vast supply of electricity from the Yuba power station to the Feather river dredgers. One of the wires had broken loose, and the doctor says it was a strange and weird sight to see the curves and bends of that wire which resembled the motions of a fiery serpent. Now the wire seemed to whirl in immense circles, making the face of the county so bright that one could see to read a newspaper a mile distant. It would strike a pool of water and the noise sounded like the mighty hiss of a gigantic reptile, while clouds of steam arose from the pool. Then it would hit the great green post to which the wires are fastened, and when it did, a sheet of flame 40 or 50 feet high would shoot up into the air. The motions and contortions of the wire were of such a character that one seemed fascinated and compelled to gaze upon it without the power to turn away.—Oroville, Cal., Register.

Gold Mining and Milling in Georgia.

Written for the MINING AND SCIENTIFIC PRESS by H. V. CROLL.

A brief description of the past methods and a few remarks regarding some of the recent advances in gold mining and milling in Georgia may be of interest to your readers, particular attention being paid to the Dahlonega district of Lumpkin county.

This district seems to have been enthused with new life after a long period of partial idleness. Ever since the beginning of mining in this State, the surface material or decomposed ores, together with the clays and sands, have been mined by hydraulic giants and sluiced to the mill bins, while the stamps were hung up. The water was allowed to drain off into the creek or river, and when the bins had been filled the stamps began dropping. All mills were fed by hand shoveling, and the usual practise was to build the ore bin with a flat bottom on a level with the bottom of the mortar. Very little attention was paid to the order of drop of the stamps, and I saw one mill having the cams so arranged on the shaft that the stamps would drop in 1, 2, 3, 4, 5 order.

These mills are usually of 450-pound weight of stamps, very light in the construction of all parts, particularly of the mortars and shafts, and especially in the construction of the mortar blocks, in which the springboard principle seems to have been followed. None of the mortars that came under my observation had any provision for inside amalgamation, and all had a very limited amount of copper plates in front of the battery, seldom more than 20 feet square per battery, and some with not to exceed 12 square feet, and in nearly all cases the copper plates were in a very bad condition, having green spots as large as your hat.

A few of the mills I visited were equipped with concentrators, but this is the exception. I am told that some years ago some of the earlier types of concentrators were tried, but with very indifferent results. In the last year a few mills have been experimenting with the more modern type of machine. This is due to the fact that most of the mines are producing ores from lower depths, which are becoming refractory.

This district is fortunate in having an abundance of water with excellent water powers, and for this reason it is the rule that almost all the mills are run by water power. By the use of the giant it was only possible to move such of the ore or rock as was decomposed and soft near the surface, taking in all of the soil and clays above it. All of this material was sluiced to the mills by the waste water from the giants, and it is evident that a large percentage of the fine free gold passed entirely through the mill and into the river or creek, caused by the large amount of water used and the amount of clay in the mass. I have observed in places where a capping of red clay 30 feet in thickness has disappeared by passing down the sluices and through the mill, in order to uncover the decomposed ore bodies.

In the mills coarse screens of extra thickness were the rule rather than the exception, and this was done, I am told, to keep the capacity of the stamps up to that of the giants, and it is commonly asserted that better than a 20% saving was seldom made. This is evident by panning the tailings below these mills that have run in past years. When mining with the giant, as soon as a solid or hard formation was encountered, operations at that particular point were suspended and attention turned to another point or place which was of a softer composition. In this way thousands upon thousands of tons of ore, rock and clay and soil have been sluiced to these mills, and the result of this work is shown by great cuts made into and through the hills. One in particular, known as the Barlow

Barlow Cut, Dahlonega District, Georgia.

mine or cut, lacks only a few feet of being a mile long, and is about 300 feet wide and 300 feet deep in the central portion.

The above is an outline of the past usual mining methods of this district, and it can be truthfully said that the science of mining and milling, especially the latter, is to-day no further advanced except in a very few isolated cases than it was fifty years ago.

At a few of the mines of northern Georgia concentrators are used and have the cyanide or chlorination process for the final extraction from the concentrates, but there are no mills thus operated in the Dahlonega district.

The accompanying cuts give views of a large plant now being erected in this very interesting district,

Chlorination Plant, Dahlonega District, Georgia.

which has a mining history dating back at least seventy years—and nearly 300 years, if the operations of the Indians and Spaniards are to be considered.

The Dahlonega Consolidated Gold Mining Co., composed principally of Ohio gentlemen, with J. W. Adams of Chattanooga, Tenn., at the head of the organization as president, has undertaken the mining and milling of the vast bodies of gold-bearing ores which have been left exposed by the operations of the early miners, upon a systematic and by the most improved methods. This company now owns and controls about 5000 acres of land—land is held in fee simple; there are no mining claims as in the Western States—most of which has been in past years cut up in the surface by the giants. As the ore bodies of this district become refractory upon gaining depth, the Georgia type of mill has been unable, with the methods in vogue, to handle ores of this character at any advantage to the operators, for the reasons given in the first part of this article. Therefore the Dahlonega Co., profiting by the experience of others and the observations made by President Adams covering a number of years, determined to build a plant of modern type and also to secure the services of well-informed operators.

This company now has almost completed a 120-

120-Stamp Mill—General View—Dahlohega District, Georgia.

stamp mill, each stamp weighing 850 pounds. The mill is equipped with forty-eight 6-inch vanners of special design to suit the requirements of this prticular ore. The crushing is done by two crushers, one large and one of a smaller size, with a revolving

120-Stamp Mill, Dahlonega District, Georgia.

screen between. By this arrangement the ore will all be reduced to 1 inch and less before going to the stamps. After crushing the ore is elevated and distributed to the stamp bins by two belt conveyors,

and is then fed to the stamps by automatic feeders of the suspended type. The mortars are of the high single issue type and arranged inside for front and back amalgamating plates. In front of each battery there is 54 square feet of copper plate arranged in three sections with mercury traps and hydraulic classifiers at the ends. The hydraulic classifiers size the pulp before distributing to the vanners. The power plant is located midway in the mill, so that the plant consists of virtually two 60-stamp mills under one roof. This was done to avoid long lines of shafting.

The power is derived from two 6-foot Pelton water wheels, having two nozzles each operating under 225-foot head of water, and two Pelton motors operating under a like head of water for driving the vanners. The large wheels are so arranged that various combinations can be secured, should at any time one of the wheels become disabled or it is desired that a portion of the mill be shut down. This power plant has a surplus of power over that required for the stamps, to drive a twelve-drill air compressor and three electric generators; one generator for lighting the mills and mines, another for operating an electric tramway, which by a system of trackage connects the various mines within a radius of about a mile with the mill, and the third supplies power for operating an electric hoist capable of hoisting from 1000 feet deep.

The water for operating these wheels is brought down the hill in a 36-inch diameter wooden pipe 900 feet long.

This stamp mill building covers a space of 300 feet long by 120 feet wide. All timber used is of Georgia pine.

The concentrates from the vanners are loaded into cars and conveyed by the electric railway to the chlorination plant. This plant consists of one Holthoff-Wethey roasting furnace with an automatic cooling floor. After the concentrates pass through the furnace and are desulphurized and cooled, they go to storage bins by means of conveyor and elevator, thence to the chlorination barrels, which are of five tons capacity, revolving on end trunnions. The filtering is done in the barrel under a pressure of 100 pounds per square inch. The balance of this plant consists of the usual sand filters, precipitating tanks, filter presses, etc. Provision was made in erecting the building for increasing the capacity at any time. As now installed it will handle from thirty to fifty tons of concentrates per day. The power for this plant is derived from a 3-foot Pelton wheel operating under 225-foot head of water. This plant is lighted throughout by electric lights, both incandescent and arc.

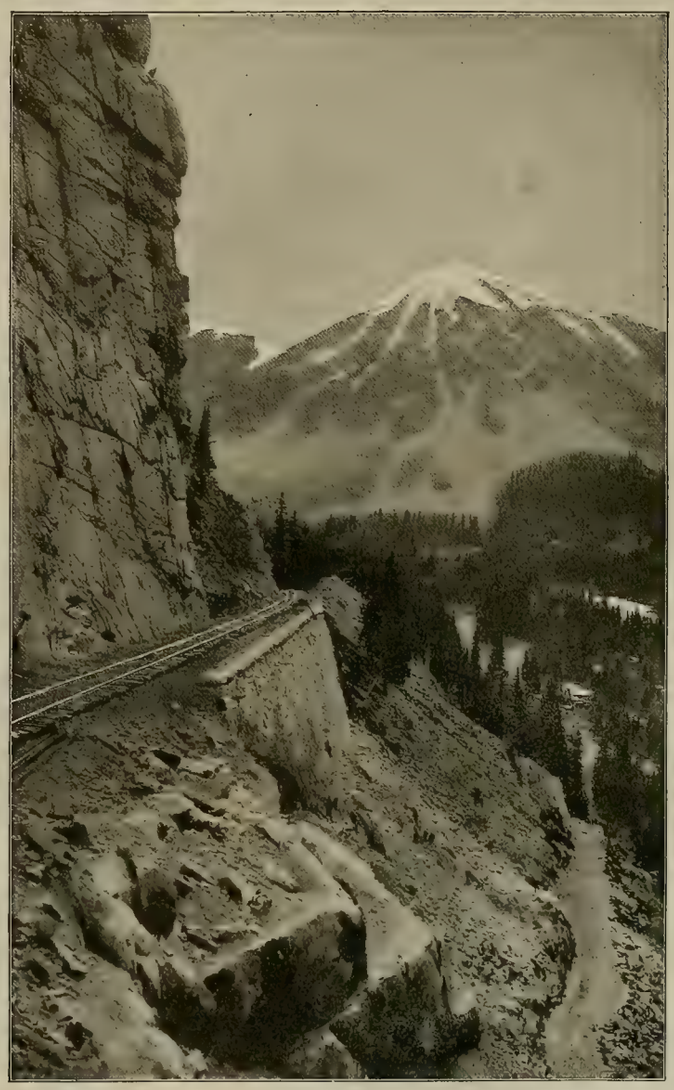
There is also in course of construction a well equipped laboratory and melting house, where the amalgam from the stamp mill and the precipitates from the chlorination plant will be retorted and melted into bars for shipment. This building will also contain the necessary departments for assayers and chemists and their required equipment, also an office for the general superintendent.

As pointed out above, the result of the use of the giant has been to expose large bodies of ore to daylight, which the company will be able to mine by quarrying for considerable time to come. However, in the meantime, a shaft is being sunk to go 500 feet deep, by which they can tap the ore bodies through drifts and also make connection with several tunnels located between the collar of the shaft and the 150-foot level. By this means the company will develop the underground portion of the mine while quarrying on the surface.

During the busiest times of construction the company employed between 500 and 600 men, colored as well as white. Labor is very cheap and plentiful, but of an inferior grade as compared with other mining districts.

The climate in the mining region, that is, in the hills, is excellent, and very healthful, the elevation being about 1200 feet.

All the machinery and lumber used in the construction of these plants was hauled in wagons over about thirty miles of fairly good wagon road, and there has been about 2,000,000 pounds machinery transported from the railroad to the mill site in this manner, being mostly done by the farmers of the immediate district.



In conclusion I wish to note that the plant of the Dahlonega Co., briefly described above, was designed and erected under the supervision of the Edward P. Allis Co. of Milwaukee, Wis., who also supplied all of the necessary machinery entering into the construction.

It is the belief of the writer from observations made in recent visits to this section of Georgia, that a new era of mining activity is about to begin and that we may expect to see the gold production of Georgia rapidly increase in the next few years. The ore bodies are there and in paying quantities, and it remains only for capital to undertake mining in a scientific way and upon improved methods to make Georgia rank well up in the list of gold-producing States.

TWO-THIRDS of the copper product in America is worked in Connecticut. The great manufacturers of copper are all there, the town of Waterbury alone attending to more than half of the copper worked in the United States.

High Mining in Colorado.

From the high plain—nearly a mile in altitude—on which Denver is built, rise to the west the mountains in which much of Colorado's mineral wealth is developed, threaded everywhere by railroads that have done so much in opening up the mining resources of the commonwealth.

The Palisades, West of Alpine Tunnel, on the Colorado and Southern Railroad.

Twelve miles from Pitkin, Gunnison county, is Alpine Tunnel, the highest railroad pass in the United States, on the line of the Colorado & Southern Ry., on the western slope of the Continental divide. The accompanying engraving portrays the Palisades, west of the tunnel. Of this region it may be said that there lies the largest body of mineralized lime in the State, with contacts containing gold, silver and lead, and adjoining is the granite with its gold fissures. Around the Pitkin basin the quartzite is the lowest sedimentary rock; on top is a blue limestone, or straight calcite, the formation extending through the entire basin. As elsewhere, the ore lies in parallel channels or chutes, having a general approximate or trend of northwest and southwest. In a few places the mineral is galena and lead carbonate carrying silver; in the majority of cases it is a quartz or baryta, with which occur the various sulphides of silver. Associated with these is a small per cent of copper and sometimes a little lead. The baryta is often as large a constituent of the ore as at Aspen, confined closely to the contact, and, when rich, lies in streaks or seams, which rarely exceed 5 feet in width.

The Quartz Creek, Gold Brick, Tin Cup, Taylor River, Tomichi, Box Canyon and Hot Springs gold and silver mining districts are all being systematically developed, timber and water being abundant and the region easy of access.

The Brunswick is a representative property of TinCup district. The company's mines consist of the Jimmy Mack, Mary Maher and other claims. This property has been a large producer. The main workings on the Mack are an incline shaft, depth 300 feet. The company has a fine stamp mill and reduction works on West Willow creek, to which the mine is connected by a bucket tramway 1800 feet in length. A view of the mill is presented herewith.

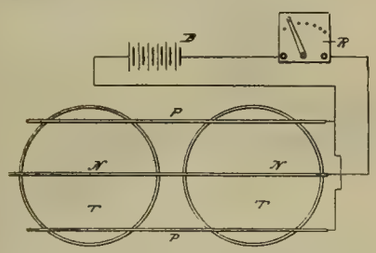
Brunswick Mill, Tin Cup District, Gunnison County, Colorado

American Competition.

A paper on the above subject, which Manager Dickie of the Union Iron Works, San Francisco, has contributed to the pages of Engineering, is interesting from several points of view. That this well-known British technical weekly should now be printing a series of articles, of which Mr. Dickie's is the fourteenth, on this one topic, is itself a significant fact. How far the Atbara bridge incident and the shipment of an unusual number of American locomotives to England last year may have led to such a result it is difficult to surmise, but that country has certainly come to realize of late as never before the extent of the rivalry existing between her manufacturers and Americans. An eager desire to learn the

secrets of American prosperity is thus excited. And the thoroughness of Engineering's effort to ascertain them is indicated by its seeking information so far away as San Francisco.

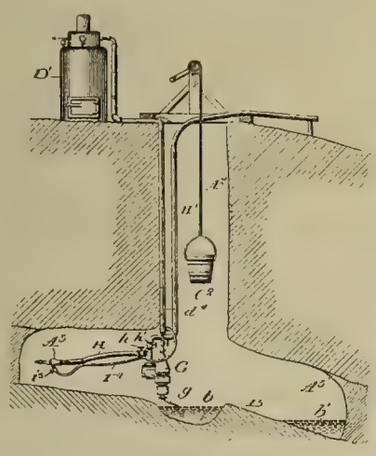
The Union Iron Works occupy a unique position, geographically and commercially. Although the chief source of iron ore in this country is the vicinity of Lake Superior, most of the material must be brought down to within less than 500 miles of the Atlantic coast to be smelted and made into steel. At present California is largely dependent on the East for her supplies of material, and the cost of transportation adds to the expense. That the Pacific coast should be able to construct first-class steel ships in spite of this disadvantage is occasion for national pride and congratulation. Mr. Dickie frankly says that the problems of competition with the eastern part of his own country are more important than those of competition with England.



Labor is more costly on the Pacific coast than on the Atlantic seaboard and in England. The manager of the Union Iron Works is not so strongly convinced of the superiority of the American workman as are other experts. Owing in some measure to causes which possibly he may have overlooked, like the wonderful evolution of the bicycle industry and its absorption of first-class machinists, he finds skilled workmen very scarce. To be sure, he says, the American idea is to dispense with labor as far as possible and use machines. But, in his opinion, this practise cannot be indulged in so conveniently in shipbuilding as in other manufactures, "unless some combination of building and owning were made possible that would admit of a number of types of vessels being designed to meet the varied needs of commerce, and then manufacturing them as required. This might help in the production of ships at a less cost than now; but * * * the country that gets its labor cheapest, unless there is some other factor in production that balances the effect of wages."

Latest Mining and Metallurgical Patents.

Patents Issued Jan. 23, 1899.

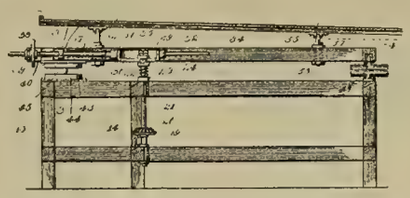


Specially Reported for the MINING AND SCIENTIFIC PRESS.

PROCESS OF PLATING ALUMINUM.—No. 641,709; W. H. Legate, Hartford, Conn.

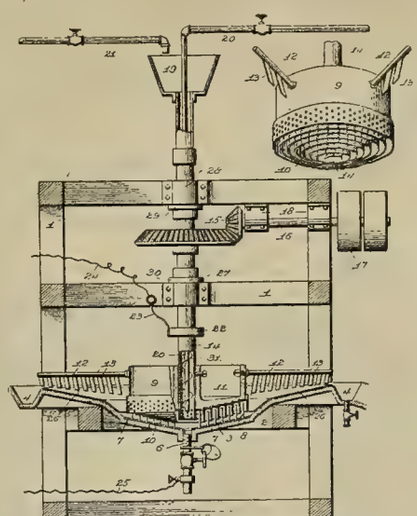
Electrically depositing metals on aluminum and its alloys by cleaning the surface thereof, then dipping it, first, in a muriatic acid solution having a gravity of 15° B.; second, in a cyanide of potassium solution having a gravity of 20° B.; third in a phosphoric acid solution having a gravity of 50° B.; fourth in a solution containing bichloride of mercury; and, fifth, into an alkaline solution; sixth, passing it through suitable electrically operated striking solutions, and from thence into the electrically operated solutions for depositing thereon the final coating of metal.

APPARATUS FOR MINING IN FROZEN GROUND.—No. 642,047; L. E. Miller, Dawson, Canada.



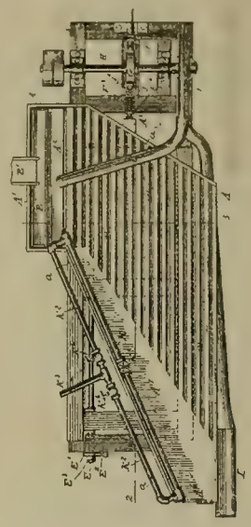
An apparatus for mining in frozen ground, combination with receptacle at bottom of mine for holding a pool of water, of steam ejector located at bottom of mine, steam generator located above surface of ground, means for conveying steam from generator to ejector, for forcing column of water through ejector in contact with steam, means for regulating admission of steam to ejector to control temperature and velocity of water, and means for conveying water back, whereby circulation of water is established within mine and raising of water continuously to surface of ground obviated.

APPARATUS FOR HYDRAULIC DREDGING.—No. 641,716; B. J. Methvin, Tacoma, Wash.



A hydraulic dredger, pipe adapted to be placed in a stream and formed with a rear inclined end adapted to reach bed of stream forward downwardly projecting end, and means for anchoring and supporting same. A tube having an angular end, so that it may be placed over a waterfall, its rear end contacting with the bed of the stream, whereby a suction is created and the material received at one end and discharged at other.

ORE WASHER AND AMALGAMATOR.—No. 641,720; J. Murphy, Butte, Mont.



A gold ore washer, combination with main frame, provided with vertical operating shaft, washer on shaft provided with toothed flanges, horizontally movable frame on main frame, sliding frame in movable frame provided with circular opening, an eccentric provided with an upwardly projecting flange at its periphery and with downwardly projecting toothed flanges, means for adjustably securing eccentric to washer, a screw-threaded shaft connected at one end with sliding frame and projecting through movable frame at other end.

AMALGAMATOR.—No. 641,808; H. M. Thompson, St. Louis, Mo.

In an amalgamator, combination with framework; amalgam pan located therein, provided with surrounding overflow gutter having a draw-off, inclined bottom provided with a centrally located depressed portion forming amalgamating chamber having central outlet and an annular series of agitating fingers extending upwardly from amalgamating chamber; a hollow shaft journaled in bearings in framework terminating at its lower end in discharge; convexed agitating head suspended and revolved by hollow shaft within amalgamating chamber; a series of perforated annular concentric flanges depending from under side of head and conforming to convexity thereof and radiating agitating arms radiating from head and provided with depending fingers.

ORE CONCENTRATOR.—No. 641,977; J. Lampert, Hill City, S. D.

An ore concentrator, combination of table having parallel front and rear sides, and obtuse-angled head end, an acute-angled tail end; both ends being provided with upstanding flanges, a feedbox at rear side of table, and parallel longitudinally disposed riffles extending from head toward tail end of table of successively greater length as they approach the discharge edge of table; with ore and water supply pipes leading to feedbox, wash water supply pipe along tail end of table, means for vibrating table, and pipe and pump for returning partially treated ores back to feedbox.

PROCESS OF PRODUCING BASIC LEAD CARBONATE.—No. 641,751; O. J. Steinhart and J. L. F. Vogel, London, England.

Producing basic lead carbonate, forming solution of lead nitrate and solution of sodium carbonate 20% in excess of theoretical equivalent required to act upon solution of lead nitrate to form normal carbonate of of lead, mixing the two solutions boiling and agitating same whereby lead nitrate will be decomposed and precipitate of basic lead carbonate result, together with carbonate of soda and sodium nitrate, thereupon separating precipitate from solution.

The Inducements Appear to Be Sufficient.

What is the use of having that partner who didn't put up his proportion of last year's work enjoy the benefit of any strike that may be made on your own or adjoining claims, when we will advertise him out for only $10 in advance?—Woodland Park, Colo., Times.

IT having been proposed to generate electricity on the Canadian side of the Niagara river, and to sell electric power on the American side, somebody raised the question whether such foreign-made electricity might not be made subject to a duty of 10% ad valorem as an "unenumerated manufactured article," whereupon the Niagara Falls Power Co. has passed a resolution stating that the company is opposed to a duty upon electricity generated in Canada and transmitted to the United States; that the imposition of such a duty is not required for the protection of any American industry; and that it might invite retaliatory legislation by the Canadian Government.

LYDDITE, spoken of so much in the present South African war, is merely melinite, the standard high explosive in both the navy and the army in France. It is doubtful whether there is any European army that has not an equivalent high explosive.

A CENTRAL STATION for the production of acetylene gas is being tested at Tata-Tovaros, Hungary, a city of 12,000 inhabitants. Five miles of pipe covers the city and furnishes gas to 158 street lights and 250 burners in houses.

SO GREAT has been the improvement of storage batteries of late that, according to an English engineer, a car now requires 500 pounds of cells, that two years ago needed 1600 pounds.

On the Concentration of Ores by the Use of Water.

NUMBER II.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. TAYLOR.

In my last paper we had reached a stage in the operation where it was necessary to recrush the tailings from the jigs, for finer concentration. Here I would be glad to specify what I consider the proper machinery for that purpose, but, for reasons patent to all, this cannot be done. You will notice, however, that I have used the word "crush" throughout, never the word "grind." The reason therefore is summed up in one word, the bugbear of all concentrator men, slimes. Therefore, install crushing machinery, not grinders.

Now, as jigs require a large amount of water, we may have a surplus to get rid of. If so, one or more pointed boxes between the jigs and crusher will take care of that, number and size of boxes depending on the size of plant. This surplus of water is by no means to be allowed to leave the mill, as there is more or less mineral suspended in it, but is to be added to the pulp as it leaves the crusher, or, if short of water, can be used in the ascending current of the sizers, or hydraulic classifiers, the use of which I strongly advise, as, regardless of how well an ore may concentrate without sizing, it will do still better with it. In case of scarcity of water, the curse of so many concentrating plants, small pointed boxes can be used instead of hydraulic classifiers. They will not, of course, equal the performance of the ascending current, but are much better than no sizing at all.

Now, as to the water supply for the ascending current for sizers. It should, in fact, must, be derived from a source independent of the balance of the mill, as the least variation of pressure gives a different size of product, and either more or less of it, and the success or failure of fine concentration depends upon regularity of feed both of sand and water. A very good plan is to have all the water for mill flow into one tank, from which is taken the supply for classifiers, the overflow from this tank being used for balance of mill.

All manufacturers of mill machinery, I believe, make hydraulic sizers, and, as far as I know, they are all good; cost, about $25 per cone. Any carpenter, furnished with 30 feet of lumber, two short pieces of iron pipe, a globe valve and stop cock, can make one.

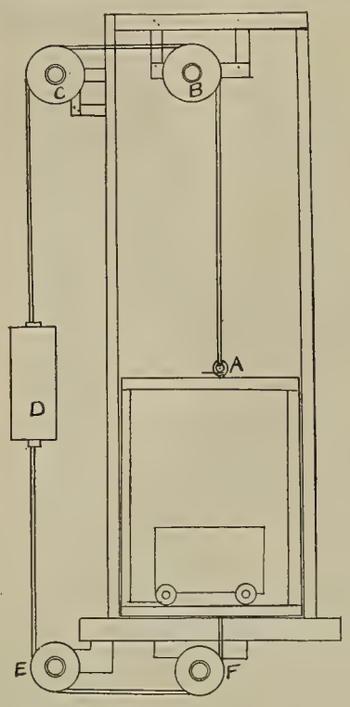
Now, as to machinery for the concentration of the sands and slimes, the product of the last and finest crushing. The same reason that excludes discussion as to the merits of crushing machinery is of equal force here; consequently, nothing further will be said regarding this class of machines except to reiterate that they all, or any of them, to do their best work, must be fed with the utmost regularity, both with sand and water.

Now, despite all our precautions and care up to this point to avoid the making of slimes, they are still with us, more or less, according to the character of the ore. Now, because I have laid so much stress upon the importance of avoiding the making of slimes, I do not wish to be understood that the values contained therein cannot be saved. It is on account of the increased cost and difficulty of saving these values that this point has been so insisted upon. Machinery for coarse concentration costs but little, and its capacity for product is large, while the reverse is the rule for slime concentration.

The concentration of slimes is a matter of plenty of clear water with which to dilute them, and plenty of tables (of the right kind) upon which to feed them. The working of slimes is like certain decimals which can be carried to a very fine point, but, no matter how far carried, the point still remains.

In closing, I will give a simple slime test for ores: Crush, not grind, sample to desired fineness, weigh out 5 A. T., put in (preferably) glass bottle, or jar with wide mouth, add sufficient water to make thin pulp, shake vigorously for one minute and let stand for one-half minute. Decant the muddy water, being careful that no sand escapes; allow the water to stand for some hours; carefully pour off the clear water, allowing none of the slimes to go over. Thoroughly dry slimes on sand or water bath, weigh, calculate percentage of slimes in ore; assay; calculate percentage of values contained therein.

Nogales, Ariz., Jan. 12.



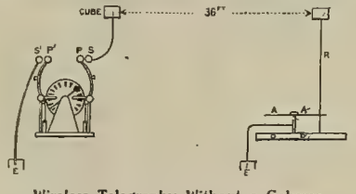
Another Miniature Working Gold Mill.

TO THE EDITOR:—I see by the last issue of the paper that the Union Iron Works have built an exact model of a 5-stamp mill on a one-tenth scale. I have a miniature mill, complete and in perfect working order; the power is furnished by a slide-valve engine with 1¼-inch stroke; the machinery consists of five stamps and plates, crusher, grizzly, concentrator and self-feeder. The total length of mill is 26½ inches; weight, six pounds.

Pearce, Ariz., Jan. 14. FRED BUCK.

Home-Made Balance Elevator.

TO THE EDITOR:—Much time and labor can be saved in mines by putting in a balance elevator, such as is shown in the accompanying figure. Nail up some scantlings in each corner, extending them from the lower floor to the ceiling of the floor above. These will guide the cage. The cage itself is easily made of a 2x2½ stuff, and provided with a ringbolt, A. Put



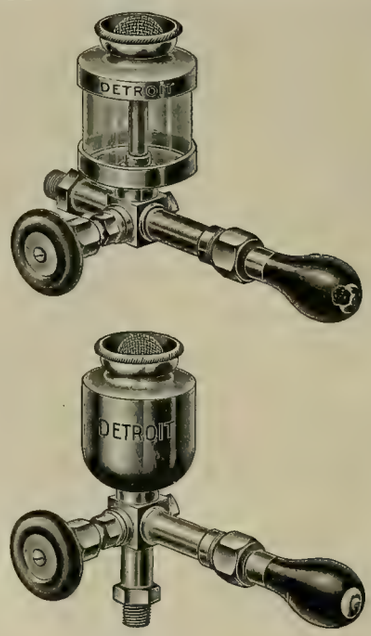
Home-Made Balance Elevator.

grooved wheels, B and C, on pins in brackets secured to the top wall, and run the rope over from A to the weight, D. This weight should balance the cage and about fifty pounds over, and pass over wheels E and F, as shown. A truck is run onto the cage, the holding pin drawn, and only a moderate pull on the rope serves to run the cage to the next level with its freight. The descent is made by hauling on the rope in the opposite direction. R.

Wireless Telegraphy Without a Coherer.

On page 635 of the issue of Dec. 2nd, '99, appeared a detailed, non-technical account of how wireless telegraphy "works," in which mention was made of the coherer. More recent experiments lead to the belief that this hitherto important adjunct may be dispensed with. Electricians experimenting with the Marconi system claim that wireless telegraphy is practicable without a coherer.

In this latest the transmitting apparatus consists of an aerial wire surmounted by a metal cube, electric oscillations being excited in the aerial conductor by sparks from a Wimshurst machine, arranged as shown in the accompanying figure. The knobs, P P^1, of the machine are separated so far that a spark cannot pass between them, but the sparks can pass across two short spark gaps, P^1 S^1, leading to earth, and



Wireless Telegraphy Without a Coherer.

P S leading to the aerial conductor. The earth-connected knob, S^1, is held in the hand by an insulating handle, so that sparks can be evoked when required by bringing S^1 sufficiently near to P^1. The receiving apparatus consists of a delicately suspended needle, preferably made of silverfoil, and the pivot on which it is suspended is connected to earth. Near one end of the needle is mounted a second aerial conductor, with a cube on top similar to the transmitting conductor. This conductor is mounted on an insulating stand. The end of the needle is adjusted so that it is quite close to the conductor, but is not in contact with it. When sparks pass at the transmitter the end of the needle is strongly attracted by the conductor. This movement of the needle can be utilized to ring an electric bell. A metal stop, forming one terminal of the electric bell circuit, is fixed on the baseboard, so that the needle strikes it as it approaches the conductor, the other terminal of the bell circuit being connected to the pivot of the needle. The movement of the needle is not due to an electrostatic field, as in the experiments of Henry, for no movement is observed till the sparks pass at the transmitter. The considerable distance at which the metallic needle is influenced also points to the action being due to electric waves. The interesting point about the experiment is that the electrostatic attraction on the needle caused by the electric surgings in the aerial conductor should be sufficient to close a circuit. This new electric wave detector is not likely to be so sensitive as the coherer.

Interchangeable Oil Pumps.

The accompanying cuts show the new-style oil pumps that have recently been put upon the market by the Detroit Lubricator Co., Detroit, Mich. An advantage claimed for them over the ordinary styles is that the body can be easily removed from the frame, should it be desirable to do so for the purpose of removing any dirt or sediment deposited by the oil, without removing the oil pump proper from the steam pipe. Each of the bodies of the four styles of

the same sizes are interchangeable. For instance, the body of the brass body oil pump with vertical connecting shank can be interchanged with the glass body of the pump shown with horizontal shank, etc. Each style is also equipped with strainer filler. The manufacturers have issued a pamphlet showing these oil pumps, also their new-style glass and brass oilers, and will send same to any address on application.

Casting Gear With Steel Core.

Sometimes a millwright is required to cast a gear with a steel core. A mandrel is used for casting with good results. The steel core can be turned from tool steel. The coating for the steel core should possess the usual non-connecting and refractory ingredients, with which a surface of 0.01 to 0.02 inches thick may be obtained. The composition is necessarily very volatile and may be bought of dealers in airtight vessels. After dipping, allow the core to drain, and, if the coating is uniform, place the core upright in a dry oven. The drying can be done by heated gases drawn from a charcoal fire. Pattern makers have made use of a cutter in scratching out core boxes. A hardwood hub is used for this purpose, turned to about the same form as the space to be cut out, care being taken to allow each pin a narrow portion of the work to attend to, and enough to take in the whole cut at once. The surface of the hub is used for a guide in grinding the pins and a small cavity made in the hub just in front of each pin for the cuttings to lie in till they are thrown out of the work.

A COSTLY STEEL INGOT was recently cast in the crucible house of the metallurgical department of Sheffield University College, England. A steel was required to contain 22% nickel, 3% paladium, with carbon practically nil. Twelve and one-half pounds of 25% nickel steel scrap were charged into the crucible and clear melted; then 6.32 ounces of paladium sheet (value £60 14s) were added to the charge. As dead mild steels occasionally find their way through the bottom of the crucible before they are ready to pour, the final stages were watched with almost breathless interest. The whole operation was, however, successfully completed, and the ingot rolled and drawn into wire.—American Manufacturer.

MINING SUMMARY.

ALASKA.

Dawson is dwarfed by Cape Nome, the latest mining attraction in the far North. Last year, at the beginning of the announcements, this paper suggested that some of the Nome gold-bearing sand be brought to San Francisco in ballast for assaying, etc. The idea had already been acted upon by several south-bound vessels which began to arrive from there with sand, some just as scooped up off the beach, some selected, and some locally concentrated. All so brought down has been sampled and tested by San Francisco assayers. The sand shoveled off the beach went from 22 cents to $1.30 per ton; the selected sand gave values of $28.50 per ton; the concentrates from $500 to $1000 per ton. The concentrates were necessarily crudely obtained, float gold being in any event difficult to save. Pan washing fails to secure more than an appreciable percentage of the gold, and the lack of fresh water and other necessary appliances interferes with amalgamation. The water used for rocking is generally that of the ocean. In a few cases, however, the sea water has been raised by steam power, and sluices constructed along the beach. In the rocker the gold is caught on blankets, and, to some extent, on copper plates, coated with mercury. In many instances, when the supply of copper plate could not equal the demand, the bottom of the rocker was covered with United States silver coins, principally $1 pieces, and these coated with the mercury, which caught the gold. The tundra between the beach and the base of the mountains has been prospected to some extent and has yielded from 10 cents to 30 cents per pan. Capital, however, will doubtless be required to handle the tundra with profit. The benches in the lower region of the mountains have been found to be gold-bearing and have been largely staked. In the gulches the work is carried on by stripping, sluicing and, to some extent, by rocking, while on the beach the method of extracting the gold has thus far been almost exclusively by rocking.

The copper sulphides offer obstacle to the use of cyanide, and the solution of the problem of extraction of greater value will probably be solved by modern machinery next summer.

From Cape Nome for thirty miles or more westward to Synrock, the shore line is straight and smooth; back of the shore line, between it and the base of the mountains, occurs the tundra, a strip of treeless, moss-covered, marine gravel, forming a costal shelf about 30 feet above sea level, sloping upward until at the base of the mountains, four miles from the beach, it is 200 feet high. During the summer it is usually wet, soft and boggy, dotted by ponds, and traversed by the Snake, Nome and Cripple rivers.

The nearest harbors for deep-sea or ocean vessels are Port Clarence, sixty miles northwest of Nome, and Golovin bay, the same distance northeast. Port Safety, to the east of Cape Nome, will admit vessels drawing 7 feet of water. In front of Nome the sea is shallow; the larger vessels cannot approach the shore, but are obliged to discharge by lighters.

The mountains thus far examined are composed of mica-schists and limestone, alternating in layers and beds with each other. They are thin or medium bedded rocks, strike and trend northeast and southwest, dip southeast at an angle of 45°. The limestone is bluish gray, fine grained, metamorphosed, often becoming crystalline marble. The mica-schist is slaty, shows considerable metamorphic action and is garnetiferous. Locally the rocks are sometimes folded and traversed by quartz veins and veinlets of both quartz and calcite, with also some iron and copper pyrites. Pyrites are also disseminated sporadically in the schists. The quartz veins and veinlets traversing the rocks are supposed to be the source of the gold.

The tundra is composed of apparently marine gravels, derived from the rocks in the mountains, and is almost exclusively mica-schist and limestone. Toward the mountains the gravels are often coarse, carrying boulders of considerable size, but along the beach they have been largely reduced to fine gravel and sand by wave action. It is in this reduced material that the beach gold occurs. Along the beach the gold is very fine, having been reduced by wave action with the gravel and sand. Its occurrence there is, for the most part, under 2 or 3 feet of gravel and sand, on a bottom "bedrock" of argillaceous sand. Thin layers of ruby sand inter-stratified along with the gravel, near the so-called bedrock, are also often found to be rich. Coarse gold is being mined in Anvil, Glacier, Dexter and Osborne creeks and along Penny and Cripple rivers.

About 15,000 men figure on reaching Cape Nome by the first steamers. Each one hopes to be the first. Two-thirds of this number will go from San Francisco and Seattle, and the remainder down the Yukon from Dawson and other Yukon towns. Dawson miners have hopes of reaching there first, and are prepared to leave the steamers below Nulato and make a portage of 200 miles across the Tundra. Nearly thirty steamers, each carrying from 300 to 1000 passengers, are now scheduled to sail from coast ports between May 10th and June 1st. Shipping men say that all steamers sailing so early will be compelled to wait at Dutch Harbor two or three weeks for the ice to move out of Behring sea.

Discovery No. 2, at the head of George Inlet, twelve miles east of Ketchikan, is reported sold to Chicago men for $14,000. Copper properties on Prince of Wales island are being investigated by B. F. Brown of New York.

The mining season at Cape Nome lasts from May to October.

ARIZONA.

GILA COUNTY.

The Old Dominion Copper M. & S. Co., at Globe, has resumed smelting, after a brief suspension for repairs.

GRAHAM COUNTY.

The Arizona Copper Smelting Co.'s smelter has begun smelting ore. At the mine timbering the working shaft goes on for a cage when the steam hoisting works arrive.

Supt. C. H. Merrill, Spenazuma G. M. & M. Co., near Ft. Thomas, has forty-five men working on some claims there.

Thirty men are working on the Markeen Copper Co.'s property on the Frisco, above Clifton. A smelter is contemplated.

PIMA COUNTY.

At the Tres Amigos gold mine, Oro Blanco district, F. M. McMasters, who recently bought the property for $40,000, is working free milling ore. He has a cyanide plant of ten-ton daily capacity. Two drifts, the first 481 feet and the second 240 feet, with an average width of 10 feet, are being run. Fifty miners are working.

YUMA COUNTY.

The Harqua Hala mine and mill are reported closed down, throwing fifty men out of employment.

The Sentinel learns that the Colorado River Gold Dredging Co. has closed a deal with a Colorado dredging corporation whereby a $60,000 dredger will be placed on the placer grounds at the Potholes, to have a capacity of 2500 cubic yards of dirt per day of twenty-four hours. Prospects on the ground are said to have shown the material to assay from the surface to bedrock at an average of 35 cents per yard, and it is claimed that the dirt can be worked for 5 cents per yard.

CALIFORNIA.

AMADOR COUNTY.

In the Central Eureka at Sutter Creek the three-compartment shaft is down 1660 feet. A 200-foot drift has been run south from the shaft at the 1500-foot level, developing good ore.

At the South Eureka Supt. Parks is reported as saying that, as soon as coal can be hauled from Ione, the hoist will be run by steam and the mill by water power.

At the Oneida, at Jackson, Supt. Truscott has the new shaft down 2100 feet. A station was cut in the 2000-foot level to run a crosscut to strike the vein.

The Argonaut mine, within the last two years, has paid twenty-four consecutive dividends of over $400,000, and is credited with present possession of over $100,000 in its treasury.

At the Wildman-Mahoney mine, Sutter Creek, Supt. Ross is drifting and stoping in both shafts. Both mills are running to their full capacity. Work in the Emerson shaft will be resumed soon.

BUTTE COUNTY.

At the Little Hope mine ten stamps are dropping and thirty-five men are employed. A new turbine wheel is being put in to furnish power for the mill and air compressor.

CALAVERAS COUNTY.

At the Vorlander mine at Middle Bar, crosscutting a ledge of ribbon rock has struck 17 feet from the shaft.

The Standard Electric Co. is building its road from the power plant at Big Bar to the new location at White's Bar, above Mokelumne Hill. The new machinery will be installed next summer.

The Standard Electric Co. has begun the survey of its new ditch, to be used in furnishing power to operate its new electric plant. An overflow dam will be constructed in the Mokelumne river about seven miles above the West Point bridge. The ditch will be about twenty-four miles long and will have an elevation of about 50 feet above that of the old ditch.

At Angels Camp the St. Lawrence mine, formerly the Bruner, has been incorporated. A mill is to be built. A. J. Cameron is Supt.

EL DORADO COUNTY.

(Special Correspondence.) — In sinking the shaft at the Little Jem mine they have found ore that will mill $100 per ton. At the Old Van mine they have struck the ledge in crosscut from lower level and from last accounts they were into the ledge 7 feet. The ore prospected by mortar test from $12 to $14 in free gold. This is an old mine which had been abandoned many years ago and is now being operated by Smart & Lane.

The Cambrian Co. have started a shaft from the tunnel level, also started another tunnel from the Lotus grade which will intercept main ore body several hundred feet deep. The mill is running steadily.

The Grizzly Flat gravel mill and mine is now being operated by lessees. The gravel runs about $4 per car. After paying expenses and royalty to the company the lessees divided over $4 to the man per day.

The Minnehaha mine is still paying line and the owner brings in a bar of gold every week. The ore mills from $12 to $18 per ton. This was an old mine that had lain idle for some time, but was bonded by a young man who had little or no experience but lots of push, and it is said he has taken out money enough to pay for the mine and mill in about one month.

The Larkin mine is going along as usual. The mill is running steadily and the mine looking well on the 600-foot level.

They are cyaniding forty tons per day at the Vanderlia mine and have ore enough in sight to last for years.

Senator Chapman & Parker have started their new gravel mine one and one-half miles east of Placerville. It works splendidly and they feel much elated over their prospects.

The Kohn & Kimball mine and mill are running as usual with good results. They are working thirty-two men.

The Landecker gravel mine is taking out some fine nuggets. I saw several ounces yesterday; the smallest was about $2.50 and the largest about $20.

At the Union copper mine, below Lotus, they are working a few men, and they have 29 feet of gray and peacock copper in the lower crosscut that will average from 10% to 50% copper and $5 to $80 in gold. It is said that this property has been sold and the first payment has been deposited with Wells, Fargo & Co., S. F.

The Wren & Proctor copper mine is having the shaft sunk deeper and they are exhibiting some fine ore that is said to come from the bottom of the shaft.

At the Union mine twenty stamps are running in the day time and they are putting up a new hoist.

A clean up of a twelve-days' run at the Bluebird mine by lessees is said to run about $4.50 per ton.

The big mill at the Bluegauge was started up to-day. They have large quantities of low-grade ore which can be mined and milled cheaply with free water power and plenty of timber on the ground. The Supt. has let a contract to mine and deliver to the mill not less than 100 tons per day at 15 cents per ton.

They are meeting with good prospects in the old Washington mine. It assays from $5 to $10 per ton. This old mine turned out some fabulously rich ore in the early days of the county.

The Ribbon Rock is being developed by Hayward & Davis. They have some rich ore, but no large bodies have yet been found. This is a Mother Lode proposition and bids fair to make a good mine.

The Poverty Point is running fifteen stamps constantly. They have large quantities of low-grade ore yielding a margin of profit to the lessees.

The Orofino Big Canyon mine is running thirty stamps and it is believed to be paying well. This property belongs to Hayward & Lane.

Placerville, Feb. 1.

Miners at Grizzly Flat have leased the McDonald gravel mine. In January they realized $4 a day to the man.

At Grizzly Flats the Grizzly gravel mine is being worked with good results; likewise the Eagle King mine.

FRESNO COUNTY.

The Royal Co., near Coalinga, at a depth of 1000 feet, has struck gas of such compression that it rose above the derricks, regarded as an indication of oil.

KERN COUNTY.

Randsburg Miner: The Wedge has milled thirty-seven tons at the Red Dog. Result—two bricks, $1800.——The new mill on the Pinmore is nearly ready.

A gusher of light gas oil has been struck by the Petroleum Center Oil Co. at 802 feet.

Engine No. 1327 was equipped at the Southern Pacific Co.'s Kern City shops with the new burners, to use crude oil instead of coal, and had a successful trial trip last week.

MARIN COUNTY.

Near Bolinas the Golden Crown M. & M. Co. is reopening an old copper mine.

MARIPOSA COUNTY.

At the annual meeting of the Merced G. M. Co. at Butte, Montana, 73,379 of the 100,000 shares outstanding were represented. A. S. Bigelow, W. J. Ladd, G. H. Lyman, J. G. Ray, J. S. Bigelow, T. Hopkins and F. Klepetko were elected directors. The purchase by Supt. Mills of a number of mining claims, real estate and water rights was ratified and the actions of the directors during the past year approved. Of the property the Boston News Bureau says, epigrammatically: "Much depends now as to whether the vein widens out materially. If it does, there is a probability of a large paying mine, if not, of a sure but small paying mine."

MONO COUNTY.

In the Blind Spring Hill district several cars of ore, running 600 to 800 ounces in silver, have been shipped to Selby's. The Tower mine has been pumped out and will be worked from the new shaft, which has been sunk 300 feet.

The Castle Peak is a producer. The Arnot will put up a large mill. The Meadow View 5-stamp mill is expected to begin in May.

In the Standard mine for week ending Jan. 27: No. feet drifts, 43; tailings assay, $7.66; concentrate assay, $126.93; men employed, 115.

The cyanide plant at Bodie had a long run this season, closing down last week for the winter.

NEVADA COUNTY.

G. Murphy has bonded the Emma quartz claims, formerly the Junction, on the San Juan ridge, for $25,000.

H. S. Brown, of the St. Patrick mine at Washington, has resumed work. The ledge is nearly 100 feet wide, the ore low grade.

The Pacific Improvement Co. has about 120 men at work near Floriston building the dam across the Truckee river—the preliminary work to transporting power to the Comstock.

Grass Valley Union: The vein has been encountered at the Grey Eagle mine, near Maybert. Mgr. J. G. Cohoe has run a tunnel through hard rock 600 feet.

PLACER COUNTY.

At Gold Run the Inskip M. Co., E. A. Moody Supt., is putting in its hydraulic rig and expects to start up soon.

At the Hidden Treasure mine Supt. Power has cut a chamber 20x30x12 feet in cement, where electric hoisting machinery will be placed. The main tunnel is now in over 8000 feet.

The Boston & South Dakota G. M. Co., which declared a dividend of 1% Jan. 23, is working a mining property in the Forest Hill divide. The South Dakota mine works the same conglomerate that the Homestake Co. has wrought for years. A 40-stamp mill has been erected there and twenty stamps are already in commission. The Weske tunnel property opens two ancient river beds in the base of the mountain. The White river channel is now being worked. The Blue river bed will be drained by the present owners.

J. Ross is running a 5-stamp mill at Ophir on surface rock. The stamps weigh only 125 pounds each. Seventy men are working at the Zantgraf. Twelve men are kept constantly timbering. The mine is paying its usual dividend.

S. C. Laird of Loomis is operating on a bar in the American by the hydraulic process.

PLUMAS COUNTY.

F. R. Moody, of the Four Hills mine at Johnsville, has a large force of miners at work.

At La Porte there is not an idle miner, the late rains having set all the mines going. The Dutch mine, Mgr. Holgate, is busy.

Port Wine and Scales, in Sierra Co., are equally busy.

C. E. Pike has men at work raising the debris dams of the La Porte Gold Gravel M. Co., on Rabbit creek.

SAN BERNARDINO COUNTY.

Silver Reef, Black Hawk mining district, geologically has but few counterparts, being a bed of calcareous and silicious material, a deposit from hot springs. The formation is about 100 feet in thickness, and has been developed to nearly this depth by shafts. The ore occurs in zones or bands of mineralized calcspar, and is chiefly chloride and chloro-bromide of silver.

SAN DIEGO COUNTY.

Wm. Brand is experimenting with tailings from the National City Reduction Works.

SANTA CLARA COUNTY.

At the old Guadalupe quicksilver mine, which has lain idle for fifteen years, machinery and furnaces are being put in order, an air pipe will extend from the hoisting works across the creek to operate

by compressed air a hoisting engine in the reduction works.

SHASTA COUNTY.

(Special Correspondence).—The Black Spider M. Co., operating near Keswick, are placing a 400-gallon capacity pump on their property. Machine drills will also be placed within a few weeks.

G. Reinhaus last week bought the Pick Up and four additional claims on French Gulch for $2039.61, and a half interest in the Bulwer and Virginia claims for $2042.86.

It is locally stated that the Mt. Copper Co. will soon begin the erection of a building in which to establish a banking house.

At Bully Hill the DeLamar Co. is building stall furnaces for a preliminary test of ores, to determine upon a process best adapted for the treatment of their output. It is reliably stated that Supt. Oxnam has selected a smelter site and reported the same to headquarters.

Redding, Jan. 31.

A gold nugget unmixed with quartz, and valued at $304, was found this week by Dow & Julian while sluicing on the north bank of Brandy creek

The roasting stalls at the DeLamar mines, at Copper City, are finished. An experimental roast will decide what system shall be used and what sort of flux shall be required. Mgr. Oxnam wishes to know whether the ore can be treated by the stall process, or whether it shall be necessary to resort to heap roasting. The former owner shipped his roasted ores to the Keswick Smelter. Capt. DeLamar will build his own smelter.

SIERRA COUNTY.

The Gold Bluff mine at Downieville has forty men and twenty stamps at work. It is owned by J. Rosenfeld's Sons, who are also operating the Triple Pocket mine, in Slug canyon, near Downieville, where ten men keep a 5-stamp mill going.

The Twin Eagles mine, near Sierra City, will soon have a 10-stamp mill in operation.

A new tunnel is being put in by twelve men at the Mammoth Springs gravel mine.

The Sierra Butte mine is running twenty stamps.

SISKIYOU COUNTY.

The Dewey gold mine, near Gazelle, recently sold to Mr. Sothers, a banker of Boston, for $125,000, is in charge of Supt. Boyle. The present force of twenty men will be increased. In the spring an 80-stamp mill and chlorination or cyanide works will be erected.

The Journal says that the Siskiyou M. Co., working a hydraulic mine on Clear creek, below Happy Camp, realized $8000 in their last clean-up.

SOLANO COUNTY.

Alf. Tregidgo is reopening the St. John quicksilver mine, near Vallejo. He says that the mine was worked continuously for seven years to April, 1880. During that time it gave employment to over 100 men steadily and produced 11,528 flasks of quicksilver. The lode that carries the cinnabar is sandstone, lying between serpentine on the west and magnesian schist on the east. Mr. T. says it has been developed 2800 feet on its course to a depth of 400 feet. The mine was worked by a system of tunnels to a depth of 210 feet, where the lowest, or drain tunnel, intercepted the vein 1100 feet from its mouth, and encountered a chamber of ore that was followed up for a distance of 80 feet. A double-compartment shaft was sunk on it to a depth of 180 feet below this tunnel level. The ore chute is 135 feet long; average width, 8 feet; 125 feet from this chute southeasterly on the course of the vein is the San Miguel chute, that has been followed down from the croppings to the bottom of the mine—400 feet. A winze has been sunk on this ore body from the main tunnel level 180 feet and connections made with it and the main shaft on the 130 and 180-foot levels, the present bottom of the St. John mine. The ore from these two chutes yielded 2⅞% quicksilver, at the present price equivalent to ore worth $40 per ton. Mr. T. has completed reopening this tunnel, a distance of 1120 feet, the entire length of which is newly timbered with 8x8 square timbers, 4 feet apart. They will now start pumping, and, after unwatering, sink another lift, during which time the furnaces will be renovated.

TRINITY COUNTY.

P. M. Paulsen of Weaverville has sold to the Last Chance G. M. Co. of New Jersey property in the Douglas City and Lowden Ranch mining districts, including the following placer mining claims: Ohio Flat, Last, Crown, Goodyear, Little Creek Outlet, Union, Gold Dollar, Vizthum Gulch, Bald Point, Hughes, Union Hill, Union Hill No. 2, Union Hill No. 3, Mabie, Roe, Vizthum Homestead, Red Point, one-half Dutton Creek and Excelsior, comprising about 1500 acres, with numerous water rights and ditches from Grass Valley creek and the South Fork of Grass Valley creek. The purchase price is $125,000. The company agrees to build a ditch, capacity 2500 inches, to the mine by July 1, 1900; $10,000 down, the entire balance of $115,000 paid by September, 1903.

TUOLUMNE COUNTY.

(Special Correspondence).—The MINING AND SCIENTIFIC PRESS correspondent spent several days in an inspection of the mines about Groveland and Big Oak Flat, in the East belt district, a region once famous for its placer gold yield. The early quartz miner opened good properties, but, after working the oxidized material near the surface, which in some instances yielded enormously, little was done in deep mining development. All this has been changed, and now the Big Oak Flat and Groveland districts show as much activity in quartz mining than any like area in the county. This is largely due to J. M. Meighan, who three years ago began systematic work along the line of permanent development. He interested Boston capital in the Mount Jefferson mine, near Groveland, showed that there was a valuable ledge in this claim and that the property would liberally reward investors. There followed development of other properties, and in nearly every instance the result has been encouraging.

The Mount Jefferson has a shaft 300 feet deep, drifts have been run from 150 to 250 feet to east and west and upraises added and good ore has been found. There are now in the ore bins, or stacked up ready for reduction, at least 5000 tons of this ore. A 10-stamp mill, erected under the superintendency of H. M. Stanley, is ready to begin. In the mill are four concentrators, a steam hoist and the requisite pumps. J. M. Meighan is Supt., E. Berry foreman. The same management controls the Pauper's Dream, or the Accident mine, near Big Oak Flat. This latter property is not so fully developed as the Mount Jefferson.

The Longfellow mine, at Big Oak Flat, has been a bullion producer for months. For its hoist it utilized a steam threshing engine, buried "up to the neck" in the earth. Steam is fed to its cylinders from a stationary boiler. The old threshing engine quivers as it hoists the ore skips from a depth of 473 feet in the shaft, but it seems to "get there" all right. Of course, the company will soon replace this relic of bygone days with a modern hoist. The Longfellow has plans for adding ten stamps to its present equipment of ten, and they will also put in a cyanide plant. All of the ore in the ledge, which is from 2 to 12 feet wide, is worked, the values being obtained mainly in the batteries and on the plates. The sulphurets are low grade, running $25 to $30 per ton. The ore carries some tellurium. Ore cars from the bins to the mill are run over a tramway by gravity, the loaded car hauling the empties to the top, the motion being controlled by a brake. The Longfellow is owned by Glasgow people. The Gen. Mgr. is A. P. Dron; T. F. Coyle, mine Supt.; C. F. Leithold, metallurgist.

Another Scotch company in the district is one which owns the Little Wonder and the Abbie L., both near Big Oak Flat. At the Little Wonder they are putting in a new hoist. They expect to put up a 10-stamp mill. The main shaft is 160 feet deep. The vein is 4 feet wide, with ore averaging $8 per ton free gold, and sulphurets from $100 to $500 per ton. The Abbie L. is an extension of the Mississippi.

The Rhode Island mine at Groveland, and the Mississippi at Big Oak Flat, owned by Boston people and both under the superintendency of Sylvester Carlon, are being developed. At the former sinking is done with a two-horse whim. A double steam hoist will be put on. The shaft follows the vein at an angle of 72° and is down 70 feet. Drifting will be begun at a depth of 200 feet. This is one of the old locations of the district, partially developed and then abandoned. T. R. Reid, postmaster at Groveland, is foreman of the work.

The Mississippi is at Big Oak Flat. Here the finest hoist in the camp, capable of sinking 1000 feet, has just been completed, with a gallows-frame 50 feet high and equipped with new machinery throughout. J. C. McLaughlin is foreman.

The Mack mine, overlooking Big Oak Flat, is a promising property. Extensive improvements are planned. The shaft is down 400 feet on the ledge, from which level, as well as from upper levels, drifts have been run, in some instances to a distance of 400 feet each way. There is a second valuable ledge in the ground and a crosscut will tap that. Within a year the present steam hoist will be replaced by a more powerful machine, and a 10-stamp mill erected with foundations for twenty stamps. E. Hirshler is Pres. of the company. The equipment will be run by electric power if available. C. Lang is Supt. of the company, which also owns additional patented ground in the locality.

The Four Oaks mine, half a mile southeast of Big Oak Flat, is another promising prospect. With steam hoist and pump a shaft is being sunk, now down 110 feet. Drifting and crosscutting are being done. Free gold shows in the entire width of the ledge, which is in slate. The stockholders are largely railroad and express people of the Bay cities, besides a block of stock owned by General Shafter. It is supposed the Four Oaks is a parallel ledge to the Mississippi, being 800 feet south. Work was begun here last September. D. R. Shafer is Pres. of the company; his son, C. S. Shafer, Supt. Mr. Shafer owns additional locations on the same ledge, which are now bonded to the Kern & Trinity G. M. Co., who will begin work Feb. 1st.

The Nonpareil mine, one mile north of Big Oak Flat, is the property of the Longfellow Co. The shaft is down about 90 feet, in a decomposed slate, which shows small colors in nearly every panful. The ledge is 30 feet wide in places. The average mill result in the working of the ore is $6 per ton. This ore is soft and easily worked. It will be hauled to the Longfellow mill, and mixed with the harder ore there obtained. A tramway is to be built between the two properties. A steam hoist will also replace the horse whim. C. F. Leslie is foreman at the Nonpareil.

L. F. White, of Groveland, has bonded to W. J. Grahame, formerly of San Jose, the Duleek mine, now managed under the name of the Experimental M. Co. The mine is four miles northeast of Groveland. Mr. Grahame will develop the property.

The Bicknell is one mile southeast of Big Oak Flat, bonded by E. E. Bronson of Colorado. The vein is 36 feet wide and assays well at the surface. Mr. Bronson will begin work in the spring.

The Kanaka, six miles northeast of Groveland, is considered by local people an excellent property. Its 10-stamp mill was destroyed by fire last summer. The mine is owned by Fresno people.

Mecartea Bros. and W. Dodge of Big Oak Flat have bonded to San Jose parties a group of mines located in the East belt. They will begin work at once.

B. Stine, J. B. Demartini and J. Jenney own the Gold Run mine, located one-half mile east of Groveland, on which prospecting is being done, with intentions of larger operations in the spring.

Columbia, which was in early days one of the famous placer mining camps of California, having a population of many thousands, is to-day an interesting region to visit, and is beginning to assert its importance as a quartz mining district. The immediate site of the town was never mined away, and the finding of gold nugnuts, or "chispas," as they are called, in the streets and dooryards, after a storm, is no infrequent occurrence. Several valuable chispas have been picked up this winter. One of the largest nuggets ever found in California was discovered at Columbia.

The Golden Era, eight miles northeast of Columbia, and owned by Thos. Conlin and Ben Pownall, is considered one of the most promising properties in the middle east belt. It has a 5-stamp mill and requisite machinery. Work was temporarily suspended during the winter.

Fourteen men are employed at the Mountain Lily mine, on Five Mile creek, near Columbia. They are driving the lower tunnel ahead to tap the main shoots. A 5-stamp mill is kept at work with good results on ore from the upper levels.

Columbia, Jan. 27.

YUBA COUNTY.

The Miller quartz claim at New York Flat is bonded to the Miller M. Co. A shaft is to be sunk 400 feet by Supt. Widner.

The Emma quartz claim in Nevada county and three adjoining locations—two in Yuba county near North San Juan—have been bonded to G. Murphy for $25,000. The ledge gives mill tests of $3 a ton.

COLORADO.

BOULDER COUNTY.

In the Rosa Lee, near Sunshine, while working in a new portion of the mine, the owner says he has opened a streak 6 inches wide of tellurium ore that runs $2 a pound.

CLEAR CREEK COUNTY.

The Idaho Springs Gazette thinks that the prospect for an early starting up of veins cut by the Newhouse is good. Sufficient tests of ore have been made to demonstrate that the depth gained—2000 feet—has not deteriorated the ore values. As high as four to five ounces gold have been obtained and the zinc and lead streaks have shown 36% for the one and 60% for the other which would make the future of the Newhouse pass the guessing point. The tunnel progresses at a daily average of 5 to 6 feet. With depth it has also been demonstrated that mother veins, only, hold their strength. In fact, as the trunk of the tree, each mother vein has spread out its branches near the surface. Locators of these branches, although they had paying mines in the main, will find upon proving up that they were only offshoots from the big trunks below and that their holdings were simply superficial. While this will be disappointing to many the final result will not affect the community, as a whole, as the ore will all have to come out. Seaton mountain, as those acquainted with it know, is a network of veins upon the surface. It was well named the "treasure vault," for hundreds of poor men made stakes by working the numerous surface pockets. And doubtless those surface pockets will continue to benefit many for years and years to come as they seem to continue with depth and are the property of the owners until merged into the main vein or veins at an as yet unknown depth. There is a difference of opinion as to whom belong the veins cut in the tunnel and the courts may be sought in some cases. But the better plan is always to consolidate in some way or other or arrange for the deposit of royalties, rather than obstruct operations. The progress of the tunnel from now on will be watched with interest, as there are some big gold producers ahead. Should large and valuable ore bodies be cut, and such an event is not improbable, a quickening all along the line will immediately follow in that section.

FREMONT COUNTY.

W. H. Foley will build a chlorination plant at Canyon City, capacity 150 tons per day.

GILPIN COUNTY.

At Central City shafthouse thievery is frequent and mine managers have resolved that they will make an example of the first offender caught. One mine reports the loss of 500 feet of almost new rope from off the drum of the engine, and a sheave frame from another mine; after the thieves had stolen oil cups and brasses from off the engine, they let the skip-car go down into the shaft, smashing things. It is not so much the amount stolen as the amount of damage which naturally follows, as the thieves do not hesitate to spoil $100 worth of machinery, and more sometimes, to get a few brasses. One of the boldest acts happened to a mining man while looking after his property. At one of the mines work was susperded and he descended the shaft to take a look at some workings. After being down only a short while he retraced his steps up the ladderway and when he reached the place where the first 12-foot ladder ought to have been he found it missing, some one having taken it while he was down in the mine. Fortunately he was well acquainted with the shaftway, and after hard work managed to get out.

Mining Record: C. Poulot, of Paris, who has been in Colorado three years making efforts to secure rare metals, has given up and returns to France. Mr. Poulot operated the Wood mine some time, getting a number of shipments of valuable uranium ore. Several months ago uranium was discovered in the vicinity of Paradox valley and the mines were secured by Mr. Poulot and his associates, who spent considerable money in their development. He says that the ore did not carry a sufficient percentage of uranium to make it pay. He found the ore, selected a ten-ton lot, took it with him to Paris, with the result that he sustained a loss of more than $300. He has wound up the affairs of the Rare Metals Co. and will look for uranium in some other quarter. (The Register-Call of Central City says, regarding this, that there was gross mismanagement, and that bills amounting to over $1600 were left unpaid.)

LAKE COUNTY.

(Special Correspondence).—The Home M. Co. will install a new hoist at the Penrose shaft. It will be 14x16 inch, 72-inch drum, the engine making four revolutions to the drum one. The new pumps are in position and are at work. The drift connecting the Penrose shaft with the Midas workings is finished. It supplies both mines with better air and the output increases in consequence. The output from the three shafts of the Home group amounts to nearly 400 tons per day.

The improvements on the Adams, Maid and Wolftone group are well under way. The new boiler battery, aggregating about 1100 H. P., is practically ready for business. The new shafthouse, enclosing a heavy gallowsframe 78 feet high, is a substantial piece of work. At the bottom of the 1300-foot shaft two powerful pumps are to be put in position, capable of raising to the surface 1000 gallons of water per minute. The 12-inch pipe being used is made to sustain a pressure of as high as 1700 pounds per square inch for the first 300 feet from the base of shaft.

The Weldon Co. are shipping about 2000 tons per month from their Nos. 1 and 2 shafts. The ore is a lead carbonate and iron. The shafts are 600 and 540 feet, respectively.

The Nubian M. Co. are getting ready to ship from their Midland shaft, 500 feet deep, in which a fair showing of ore has

been encountered. Drifts are being run in all directions from the shaft. This shaft cuts the ore body on the west side of the carbonate fault, the ore being an iron and lead ochre. The same company have machinery on the ground to sink a shaft on the P. O. S. to a depth of 500 feet. The Weldon and Nubian groups are on Carbonate hill.

The Iron-Silver M. Co. are restoring the equipment at the old Stevens shaft, which has not operated for eight years. The 550-foot shaft will be unwatered and then sinking will commence. The ores here are an iron sulphide.

Sands, Douglas & McGuire are operating a group of mines in Iowa gulch, which compose the Continental Chief, Horseshoe-Prince, Hill Lode and Silver Cliff, all of which they have leased. The development here, which is quite extensive, is all by means of tunnel work.

The Winnie claim of the Monarch Co., on Little Ella hill, is making small daily shipments of copper sulphide ore, carrying gold, silver and copper values.

Thos. Owens, lessee of the Elk mine, on Breece hill, is operating the property, having already shipped considerable ore from the 540-foot shaft. The ore thus opened is a lead product, but it is the intention to sink deeper, and, if possible, cut the sulphide zone in which the Ibex is operating.

Within the last six months the Denver & Rio Grande Railway Co. and the Colorado & Southern have built belt lines over the active sections of Carbonate, Iron, Breece, Yankee and Little Ella hills, and the principal mines of the district are thus reached by spurs from one line or the other. As a result of this, trestles have been built from all the principal shaft-houses, extending out over the railroad track, by means of which the ore cars from the mines are dumped into the railroad cars.

The Sedalia, belonging chiefly to O. C. Bartholomew, is being put in shape for production. The old stopes are being put in condition for work and drifts are being run into new ground. A fair grade of ore is exposed on every hand.

Leadville, Jan. 24. WASCOTT.

PITKIN COUNTY.

At the Mollie Gibson mine at Aspen ore running 5000 ounces silver a ton has been found in the lower workings.

ROUTT COUNTY.

J. O. Nehring of Battle Lake says that from Sept. 25, 1899, when work was begun on the new shaft in the Rudefeha, to Jan. 15, 1900, the company has sacked $1,058,300 worth of ore, part of which has already been shipped to the smelters.

Steamboat Springs reports considerable interest in news from the new copper camp near McCoy, in the Red gorge, twenty-five miles by wagon road from Wolcott, where a sample of ore from the claim of Robinson & Clark assayed copper values of 22.6%.

TELLER COUNTY.

Cripple Creek district is to have another electric plant, the generators to be driven by water from Lake Moraine. The company will furnish power first to the Gillett mill at Gillett. The location of the power plant will be five miles below Strickler tunnel. There is a 100 H. P. generator there now. An order has been given for three more. It is expected that they will be installed this month.

The Portland mine at Victor still leads, the present output being 170 tons of ore per day, value $50 per ton.

IDAHO.

ADA COUNTY.

Supt. Ingersoll of the Ingersoll & Hamlin M. Co., at Hartville, will build a mill, to be an amalgamator and concentrator. The ore runs $9 to the ton. There are six tunnels on the property.

BLAINE COUNTY.

At the Ætna Mining Co.'s mine, at Hailey, 68% lead, 86 ounces silver and $5.25 gold per ton is returned from a shipment by Mgr. Wilson.

IDAHO COUNTY.

(Special Correspondence.)—Elk City: The Dredger Company on Red river have a large crew of men cutting cordwood for the dredge, and the company state they will probably build another machine this year.

Dixie: A force of men under Wm. Springer has been sinking on the Ajax property for the past two months. At a depth of 60 feet the lead was crosscut and is 18 feet wide, all of which is said to contain a milling value. Sinking is to be continued, and if satisfactory results show up with more depth a mill will be erected this year. The property is owned by Campbell & Finch, the Spokane operators.

Buffalo Hump: Very little work is going on in this camp this winter. Clark & Sweeny have a crew doing assessment work on a number of claims. The Boston Company are working the St. Louis, which they recently purchased for $30,000.

Florence: The dredge on Black Sand creek will be ready to make the gravel fly as soon as the snow is gone. Little Slate creek has been thoroughly prospected by a Portland company, and they will put in a dredge this season.

Newsome: The Iron Crown mine, which produced $26,000 last season in a small mill, will resume operations in March, and it is reported they will install a new mill.

The Newsome & Leggat Creek Co. will commence active work on ditch construction as soon as snow leaves the ground, and expect to get a short run this coming fall.

Salmon River: On the coarse gold channel above John Day's diggings were struck in drifting that yield $30 per pan. This is, of course, pockets, but hundreds of dollars are taken from these rich pockets in coarse nuggets.

Grangeville, Jan. 28.

The Queen of the West lode in Florence has been sold to Eastern men for $10,000. It is the only patented claim in Florence and covers part of the townsite.

W. H. Young of the Boston & Buffalo Idaho M. Co., from Buffalo Hump, reports from Grangeville: A winze has been sunk 30 feet from the floor of the south drift on the St. Louis claim, at a point in the drift about 40 feet from the crosscut. The foot of the winze is 130 feet below the surface. The pay shoot is apparently 200 feet long.

OWYHEE COUNTY.

Supt. Irwin of the War Eagle tunnel is driving the tunnel 9 feet per day. It is 350 feet long. The company now employs forty men.

The Trade Dollar Con. M. Co. starts its 10-stamp mill at the Black Jack on February 1st.

MICHIGAN.

Experiments are being made in the Red Jacket shaft of the Calumet & Hecla mine to discover the increase in temperature as greater depth is attained. The shaft is now down 4900 feet. Holes have been driven in the wall rock at intervals of 100 feet, and in these slow-registering thermometers have been placed and the holes in the rock plugged up and sealed. In this way it is proposed to approximate the depth at which the temperature would permit work. At 4500 feet the temperature in the Calumet & Hecla is 85° Fah., while in the Comstock mine in Nevada, at a depth of 2000 feet in some shafts, the temperature is 150° Fah. It is thought that hot springs have a marked influence upon the temperature in the Comstock, and it is probable that the proximity of the Calumet & Hecla workings to the waters of Lake Superior partially account for the fact that at similar depth the Calumet is cooler than any other shaft of which record has been made.

MONTANA.

FLATHEAD COUNTY.

A. M. Esler will begin active operations upon the Cracker, Bull Head and other copper properties bonded from the Michigan & Montana M. & S. Co. He intends to build roads, erect concentrators, sawmills, etc. The properties are in the neighborhood of St. Marys lakes. He is confident of the richness of the ores.

JEFFERSON COUNTY.

The Butte Miner hears that the Elkhorn M. Co. shut down its big mine Jan. 24th. It was run as a company proposition, and employed 500 or 600 men, who are now out of work. It was the only big concern in the Elkhorn district. The mine has been worked by the company that owns it for several years. It formerly belonged to the National Bank people of Helena. They sold it to the London Exp. Co., and the latter has operated it since. There is said to have been enough ore blocked out in it to keep it in operation for two years. The company has taken out the pumps and sold the machinery. The mine is down 2300 feet, and the pumps were on different levels. The mine is a gold and silver proposition, mostly silver.

MADISON COUNTY.

At Pony the Old Joe, Cleveland and Bland claims are bonded to J. F. Cowan of Butte, who has a company. Men are at work sinking a 200-foot shaft to drift both ways on the vein and develop the property enough in three months to ascertain if it will warrant the erection of a concentrator.

SILVER BOW COUNTY.

The usually well-informed News Bureau hears that the Butte & Boston is now producing rather better than 1,000,000 pounds of copper per month, and has prospects of paying a small dividend this year. If copper could be kept above or at 15 cents per pound, Butte & Boston could probably be made to pay $3 or $4 per share per annum. The company now has a working balance of more than $500,000. How far it shares in the expenses of the Butte litigation against F. A. Heinze, which should be costing the Anaconda, the Butte & Boston and the Boston & Montana nearly $1,000,000 per annum, is not generally known.

The Anaconda Co. contemplates the diversion of the waters of Silver lake to supply the smelters. The lake is fourteen miles west, and possesses no natural outlet, occupying a basin in the heart of the mountains. To reach this natural reservoir a tunnel will be driven a mile through the base of a mountain.

The jury in the United States District Court at Helena, on Jan. 31st, returned a verdict in favor of F. A. Heinze, in the suit brought against him by E. R. Morse, trustee, for the recovery of $150,000 damages for the extraction of ore from beneath the surface of the Michael Davitt claim in Butte, where Heinze has been mining from the surface of the Rarus and Johnstown claims adjoining, which he owns. The outcome of the suit determines the title to the rich stopes beneath the Davitt surface, valued at $4,000,000, and a part of the assets of the Great Amalgamated Copper Co.; Morse being presumably a trustee for the company in holding the property, which was sold to him by the receiver of the Butte & Boston Co. two years ago. The trial has lasted since Dec. 11th. The costs of the winning side will be close to $300,000, exclusive of large attorneys' fees. It is a companion suit of the Pennsylvania case, decided by the Butte District Court recently in Heinze's favor, and the ore bodies in issue in both are worth more than $5,000,000. The ledges in dispute are a part of the Anaconda lode. This case was tried two years ago, the trial lasting ten weeks and resulting in a disagreement. The jury was out but a few minutes, and agreed on the first informal ballot. The main issue involved was the question of extralateral rights, complicated by the contention that the veins in controversy were faulted, and not continuous from the surface to the depths, the rich bodies in dispute existing below a level of 600 feet from the surface.

NEVADA.

CHURCHILL COUNTY.

A carload of ore by J. Weyburn from I X L district shows 600 ounces silver with some gold per ton.

ELKO COUNTY.

At the Young America change has been made from steam to gasoline in the hoist. The only objection raised to the new power is in the noise, and that can be obviated by the suggestion on page 743 of the issue of Dec. 30, '99.

ESMERALDA COUNTY.

The Vulcan Copper M. & S. Co. has nine claims at Siegelton. The ore is oxide and carbonate of copper, carrying $2 in gold and three ounces silver. The percentage of copper varies from 4 to 8. A three-compartment shaft is being sunk. Fifty men are employed. A 100-ton smelter is being constructed at Sodaville; a spur track will be run four miles. The company expects to spend $100,000 more before starting to work the ore.

HUMBOLDT COUNTY.

The Kent Mining Co., of Chicago, have bonded the Glen Lyon and Glen Levit group near Golconda. They will sink a shaft 200 feet and run a drift on the 50-foot level 100 feet.

Alviras E. Snow and his associates have bought the Del Monte group of gold-bearing claims for $20,000.

LINCOLN COUNTY.

At the De Lamar mine, the biggest producer in the State, investigation goes on with a view to change the present dry mill process for the pan amalgamation or wet process, and to erect a mill of 100 stamps, which will enable them to handle 300 tons of ore daily. The company is about to handle a lower grade of ores, and the change will enable it to operate at less than cost. One marked result of the change, if made, will be the elimination of the dust problem which has been the destruction of so many lives. The trouble has been not so much the process as the nature of the material handled. The same process is used in the Cripple Creek district without the same deleterious consequences, owing to the difference in the material. The ores at De Lamar are pure silicia, and the dust is composed of particles as sharp as glass dust. With the wet method of treatment this long-standing danger will be ended. At Deer Lodge it is proposed to substitute the dry for the present wet process, but the difference in the material is a guarantee against deleterious effects on the men.

The Eye: The Quartette Mining Co., of Boston, Mass., will shortly erect a 20-stamp mill on the Nevada side of the Colorado river, forty miles north of The Needles, with the intention of working ores from the Searchlight district, fifteen miles west from the mill.

LYON COUNTY.

J. H. Rae, Supt. Dividend Mining Co., will build a crushing and concentrating plant at Como.

The bonding of the Excelsior copper property in Mason Valley for $20,000 has lapsed.

NEW MEXICO.

J. T. McLaughlin, Supt. Santa Fe M. Co. mines, reports working of mine for year ending Jan. 1, 1900, to be 2130 feet. Receipts for year (cash), $500,000; interest, $8581; total, $508,581; expenses and insurance, $69,611; cash at mines, $8370; cash at bank and bankers, $430,600; total, $508,581. Plans have been completed for a smelting works, capacity 150 tons a day, work to soon begin.

BERNALLILO COUNTY.

W. C. Wynkoop, Mgr. custom mill of the Cochiti D. & I. Co. at Woodbury, has a bond on the Good Hope, Hopewell, Black Girl, Allerton and Posey.

The electric light and power plant of the Cochiti G. M. Co. will be in operation April 1. Along the thirty-three miles of poles to Bland, there will also be telephone, electric light and power wires. A branch line will be run to Thornton to meet the Albuquerque line. The line is intended to connect Cerrillos, Madrid, Bland, Santa Fe and Albuquerque.

OREGON.

JACKSON COUNTY.

A contract is to be let for the longest mining ditch in the West, ninety-three miles, beginning above Rogue river falls and terminating at Gold Hill. It will drain 100,000 acres of placer ground, and is to cost $700,000. M. P. Warde says the preliminary surveys have been finished and the right of way secured. For four months past eighteen surveyors, in charge of J. S. Howard, have been running the necessary lines. Estimates are now being made. The territory which the ditch will drain is recognized as rich placer ground, the mines of which heretofore could only be worked during the wet season. The company proposes to furnish electric and water power to quartz mines.

J. R. Huggins, west of Jacksonville, recently took $200 out of a pocket. W. H. Lee extracted an equal amount from a pocket near Applegate.

JOSEPHINE COUNTY.

I. Humason of Portland wants to put up a mill between Rogue river bridge and Houck's mill.

UTAH.

Tribune: Gomer Thomas, State Coal Mine Inspector, has filed his annual report with Gov. Wells. The output of 1899 showed an increase of 204,825 tons over 1898, and Inspector Thomas looks for a heavier tonnage this year. There were no strikes nor lockouts, wages were fairly good and employment steady.

Supt. Carter, Albion M. Co., has an entire new force at Alta. The former crew, with the exception of one member, who remained at the pumps, walked out on him a few days ago and left him almost helpless. According to the retiring miners, it was all because the Albion Co. had availed itself of an opportunity to relocate abandoned territory when the men employed at the mine had planned it. The management of the company confesses to it, but says it did so without knowledge whatever that any one else had his eye on the abandoned ground.

SALT LAKE COUNTY.

Contracts for the construction of the new 300-ton smelter for the Bingham M. Co. are ready, the smelter to be completed in eight months, to cost $200,000. The company has in sight considerable ore, and estimates that it can treat its 6% copper ores at a profit, the gold and silver values paying all costs of ore treatment.

TOOELE COUNTY.

In the Bunker Hill, at Stockton, Mgr. Sharp has begun the raising and sacking of ore samples which show 77.5% lead, 17 ounces silver and $4.13 gold per ton.

WASHINGTON.

SNOHOMISH COUNTY.

W. C. Rutter, Pres. Kittanning C. M. Co. at Index, has a ledge of 4½ feet. A tunnel will be driven on the vein, which cuts into the side of the mountain at an angle of 75°.

YAKIMA COUNTY.

The Star Creek M. & M. Co. at North Yakima has free-milling ore at one of its ten mines owned by the company, yielding $7.50 to the ton.

FOREIGN.

AUSTRALIA.

James Parkinson writes from South Australia that there is no telluride of

nickel in South Australia, alleged to have been discovered last July at Worturpa, and asserts that there is no such mineral as melonite found in Australia. "The telluride bismuth found at Worturpa is only a mere trace, but enough for inexperienced assayers to swear by. All yet found is not one pound in weight, on which all the sensation arose, and only in splashes on rock matrices."

The Queensland Government Analyst complains as follows: "In the beginning of the year a supply of chemicals, supposed to be chemically pure, was obtained from one of the best English firms, but most of the substances supplied were certainly not pure, for example: the zinc contained arsenic, the fusion mixture contained silica, iron, alumina and magnesia, and the citric acid and tartaric acid contained lead; while, although the substances were all sent out here in glass-stoppered bottles with parchment over the stoppers, most of the chemicals had small pieces of paper, sawdust or straw mixed through them. Altogether the order was anything but satisfactory, and led to a great deal of trouble and extra work in purifying some of the chemicals, while others were absolutely useless."

BRITISH COLUMBIA.

J. M. Kellie, member of the Provincial Parliament for the Revelstoke division of West Kootenai, has introduced a bill entitled "For the Regulation of the Length of Hair that May be Worn by Employes in the Metalliferous and Other Mines of British Columbia." The object is to take advantage of the Oriental superstition in favor of the queue to exclude Chinamen from mine workings.

The removal of the duty on pig lead, resulting from Canadian bullion being refined in the United States, has caused the blowing in of the lead furnace at the Trail smelter.

W. A. Pfeiffer, Pres. Pathfinder M. Co. and Mgr. Katie W. G. M. Co., on the North Fork of Kettle river, reports the levels down to 200 feet. The main shaft is on the center of four leads; plenty ore in sight to ship when roads are in condition. A 50 H. P. boiler, engine and hoist will be installed this month; later on a compressor plant of five drills will be put in.

H. McRae, managing director Boundary Creek M. & M. Co., near Greenwood, says work has been resumed on the Gold Bug.

The work was principally on the northeast rim of the deep channel, commencing on the west bank of the Horsefly river, about 40 feet below the river level, and following the gold on the sloping bedrock in a northerly direction, endeavoring to find the source from whence it came.

With powder drifts run ahead of the work, and the mine opened more than last season, he expects next season, with the same amount of water, to handle three times the amount of gravel.

Mgr. Ward states that the plant is now complete, in good condition, the mine on a paying basis, at a cost to the company of about $225,000.

MEXICO.

SONORA.

Two Republics: The Colon gold mine, near Yecora, Sahuaripa mining district, has been sold through Mr. Harper to an English company for $250,000. The syndicate which purchased it have also purchased the Pinos Altos mine, in Chihuahua, for $1,500,000. This is a silver and gold property. The Mulatos mine, in the Sahuaripa district, has recently been sold for $600,000. The Trego mine, near the Colon mine, in Sahuaripa district, has just been sold for $150,000. The Gavilan mine, near Ramona, in the Ures district, has been sold by F. O'Donnell for $10,000. The Paloma Mining Syndicate, of which Mr. Lauder, assistant superintendent of the St. Helena mine, is the head, has taken the La Paloma mine at $180,000. Prospectors and mine buyers are overrunning northern Sonora, and any good property is soon taken. The Santa Edwinge, in the Sahuaripa district, is down 100 feet on the vein in ore that runs 200 ounces in silver.

Recently Declared Mining Dividends.

Atlantic M. Co., $2 per share; payable Feb. 15.

Colorado Fuel & Iron Co., 8%; payable Feb. 15.

Grand Gulch M. Co., $2400; payable Feb. 15.

United Verde Copper Co., Arizona, 50 cents per share.

Boston-South Dakota G. M. Co., 1%; payable Feb. 15.

Last Dollar G. M. Co., Colorado, regular quarterly dividend, $30,000; Feb. 1.

Standard Con. M. Co., California, 10 cents per share, $20,000; payable Feb. 10.

Yukon Crude Oil Co., California, second dividend 4 cents a share; payable Feb. 10.

Personal.

W. S. KEYES has returned to San Francisco from Grass Valley.

MATT W. ALDERSON has returned from Butte to Silver Star, Mont.

PHILIP DEIDESHEIMER has returned from Sonora, Cal., to San Francisco.

W. P. HAMMON, of Oroville, Cal., has returned from an Eastern business visit.

J. FRANCIS succeeds J. F. Littlefield as Supt. Densmore mine, Tuolumne Co., Cal.

E. B. KIMBALL contemplates a mining trip to Chihuahua, Mexico, next month.

ALF. TREDIDGO is opening up the St. John quicksilver mine, near Vallejo, Cal.

A. THURSTON HEYDON has returned from the Yukon region to Placerville, Cal.

MGR. JONES of the American Smelting & Refining Co. is in Salt Lake City, Utah.

J. F. RUER succeeds J. S. Tebbets as Gen. Mgr. Duquesne M. Co., Pima county, Ariz.

E. B. GAGE announces his election as Pres. Cobre Grande Copper Co., Sonora, Mexico.

ASST. SUPT. J. H. HUTCHINSON of the Trade Dollar Con. M. Co., Idaho, is ill in Denver, Colo.

W. PELLEW HARVEY has returned to Vancouver, B. C., from a professional visit to London.

HARRY LANE, of California, is working a quartz claim on Red mountain, Mt. Baker district, Wash.

W. H. TERHUNE of Salt Lake, Utah, has been engaged to operate the Twin Bridges, Mont., smelter.

F. F. SHARPLESS, Gen. Mgr. California Copper Co., expects the Madera smelter to be in operation next week.

W. E. HENDRY is now Mgr. Esperanza, Mexico, mines. The mill has 100 stamps and crushes monthly 9000 tons.

JOEL PHILLIPS is succeeded in the managership of the Junction Silver Co., Broken Hill, N. S. W., by J. C. Moulden.

SUPT. F. F. THOMAS of the Gwin mine, Cal., has resigned his position because of ill health, and is succeeded by David McClure.

JEWETT SCRANTON has been appointed by the Mountain Copper Co., Keswick, Cal., Supt. of the Stowell group of copper mines, near Copley.

JOHN Q. MCDONALD, of the National Gold Extraction Co., Florence, Colo., thinks his new chlorination plant will be finished about April 1.

ARTHUR THOMAS, for several years Supt. British gold mines, El Oro, Mexico, is in Sumatra, examining and reporting upon a mining property upon that island.

WALTER HOVEY HILL, of Grangeville, Idaho, formerly Supt. of the Big Buffalo mine, in the Buffalo Hump camp, has been elected Gen. Mgr. of the Newsome & Leggett Hydraulic M. Co., Ltd.

W. B. VANDERLIP, JR., who for three years has been investigating placer deposits in Siberia for the Russian Government, with headquarters at Vladivostock, returns from San Francisco to Siberia this month.

BEN AND LEWIS WILLIAMS, old California miners, but for many years identified with the Copper Queen of Arizona, have come north, the former being now in British Columbia, the latter sojourning in San Francisco.

E. T. BRADFORD, Mgr. Southern Smelter Co., is in Portland, Or., to investigate a smelter proposition and see what resources Oregon possesses in that line. Mr. Bradford's process is the Loder hot-blast system.

C. W. DAILY, engineer-in-chief Sydney Harbor Works, Sydney, N. S. W., will receive competitive plans for a bridge over Sydney harbor. The bridge is to cost $2,500,000 and a prize of $5000 will be awarded for the best design.

W. F. DURAND of Cornell University has been awarded the first prize for the best technical essay submitted to the American Society of Naval Engineers for his paper on "Electrical Propulsion for Torpedo Boats." The prize consists of life membership in the society and a gold medal.

THEO. F. VAN WAGENEN, E. M., of Denver, Colorado, is making his headquarters this year at Boise, Idaho; he has recently completed preliminary examinations of the Snake river in that State between Blackfoot and Glenns Ferry, with the view of utilizing water power for an irrigation canal.

CHAIRMAN LACEY, of the Congressional House Committee on Public Lands, says it will be impossible to pass general land laws for Alaska at this session, owing to opposition in the Senate. He has prepared a bill which will meet the emergency that has arisen, or will arise, in the Cape Nome and other thickly populated gold fields, which measure, he thinks, will meet the present demands. He thinks his bill will pass without difficulty, as it affords relief for the overcrowded mining districts, where trouble will ensue if proper provision is not made.

HENRY KENNEDY of Homestead, Pa., after an absence of two years in Mariopol, Russia, where he has been engaged erecting a steel mill, says that there is no danger of the Russians becoming competitors of the United States, as they have not the raw material, and are fifteen or more years behind American industrial development.

O. O. HOWARD, JR., Pres. Ratcliff Con. Gold Mines, Ltd., went East this week for estimates on an electrical power transmission plant, to be installed in the Panamint mountains, to operate the mills of the Ratcliff Co. It will require six months to get the machinery from the manufacturers and install same at the mines. It is expected that at the time the electrical plant is ready the present milling capacity of the mine will be doubled. Mr. Howard says that developments at the mine in the lower tunnels are of such a nature as to warrant the erection of a large plant.

CAPT. THOS. MEIN, in an interview with the Oakland, Cal., Tribune, talks freely regarding the Transvaal troubles. He was one of the prominent American miners in Johannesburg at the time of the Jameson raid. Regarding that episode, he says: "The Boers betrayed me and my companions. After they had us arrested, they told us that if we would plead guilty to a certain offense we would be fined $17.50 each. On the advice of our attorneys we pleaded guilty. They then dug up some old Roman-Dutch laws that would have hanged the whole of us. After being imprisoned for six weeks we were allowed to purchase our freedom by paying $10,000 each."

VICTOR M. CLEMENT sailed for England on the 22nd ult. Before leaving he told a reporter that when he was manager of the Simmer and Jack mine, at Johannesburg, South Africa, he asked Mr. Williams why he did not bring out some American wheelbarrows, as all the Rand mines wanted them. Williams said he would if he could get sufficient orders, and promised to look into the matter. He went to the various mines, and as they all wanted American wheelbarrows, he received orders from each and every one of them. This, however, did not seem to wholly satisfy Williams, who then went to the local traders, and told them that he had heard that there was a large demand for American wheelbarrows in the mines there and asked them why they didn't import some. The traders investigated, found that the demand was great, and forthwith authorized Williams to bring them out a supply. The wheelbarrows Williams imported under these combined orders came to nearly a shipload. Upon their arrival he made his first deliveries to the mines, and then turned over to the retail dealers their supply. The latter at once sent notices to the various mines that they had imported a supply of American wheelbarrows, and solicited orders. In every instance the reply was that that particular mine had a supply of the article mentioned sufficient to last for some years. They had been there before, however, and beyond a few remarks about Yankee tricks they took their medicine quietly and with chastened spirits. American wheelbarrows, though, were the cheapest things one could buy in the Transvaal for some time after that.

Industrial Notes.

—The South African war is costing England $5,000,000 per week.

—The rails on the Columbia & Western Railway are laid to Midway, B. C.

—The Santa Fe road will move its shops from Raton, N. M., to La Junta, Colo.

—Oregon's lumber output for 1899 was 669,650,000 feet; Washington's, 723,000,000 feet.

—The Southern California Ry. Co. in '97 showed net earnings of $57,007; in '98, $479,285; for '99, about $725,000.

—It is estimated that a double cable from San Francisco, via Guam, Manila to Hongkong, will cost about $30,000,000.

—Minneapolis, Minn., gets the convention of the United Mine Workers and the Interstate Conference of Operators and Miners in 1901.

—The Cascade tunnel on the Great Northern road in Washington will be 13,253 feet in length; cost $3,000,000. When the tunnel is turned over to the railroad company next October the cars that will run through it will be operated by electricity.

—In answer to about 4000 letters sent out by Rogers, Brown & Co. of New York to their customers throughout the country to ascertain the probable requirements of pig iron this year, consumers indicate that they will melt from 30% to 60% more pig iron this year than in 1899.

—Orders have been placed for two more automatic iron ore shovels for use on the Carnegie docks at Conneaut, Ohio. The great scoop, which is a part of the massive 400-ton machine, dips up ten tons of ore at a time, one machine working ten hours a day doing the work of 100 men.

—During '99 there were 7366 industrial establishments in Japan, of which 2968 employed motive machines and 4398 were without mechanical motive power. The first group includes 274,000 workers and the second 140,000, or a total of 414,000 workers. The industrial consumption of coal has increased there from about 278,000 tons in '93 to over 2,000,000 tons in '99.

—Continued coal shortage in San Francisco and increasing demand in the Northwest is causing active demand for coal properties. Eastern men are buying 1200 acres of coal lands at Sumas, on the extension of the Bellingham Bay & British Columbia Railroad. The Tacoma Eastern Railway will develop the Nisqually coal field, thirty-five miles southeast of Tacoma, Wash.

—Wm. Blackman, State Railway and Factory Inspector for Washington, makes the following statement of wages paid in that State at the mills: Book-keepers, $4 per day; engineers, $3 per day; firemen, $1.75 per day; head sawyer, $4 per day; shingle packers, $2.50 per day; filer, $4 per day; planer men, $2.50 per day; other mechanics, $2.50 per day; talleymen, $2.50 per day; blacksmiths, $2.50 per day; boom men, $2.25 per day; common laborers, $1.85 per day.

—The baled hay shipped from San Francisco for the American army in the Philippines is compressed by a new process. The hay is put up in bales cylindrical in form, about the size and shape of an old-fashioned nail keg, 18 inches high and the same diameter. When baled in this shape the hay is hard as a board. The bales weigh about 145 pounds. The hay is hand-cut in pancake form. The hay pancake or layers, which make the bale, are about ¾-inch thick. The most compact bale of hay put up by the old style required 160 cubic feet of space per ton. The new way hay takes 50 cubic feet of space per ton.

642,058.—LOAD GATE — G. D. Norswick, San Jose, Cal.

Books Received.

"A Text-book of Ore and Stone Mining;" 4to, pp. 744, C. Le Neve Foster, third edition, with frontispiece and illustrations, the object of which, as the writer states, is "to assist students in acquiring a knowledge of the art of mining." Comparison with former editions shows that some of the matter has been re-written and more added. The methods and citations are largely European, and the descriptions apply more to British systems and conditions than to American. The book has value as a reference for such information. Philadelphia: J. B. Lippincott Co; $10.

Latest Market Reports.

SAN FRANCISCO, Feb. 1, 1900.

SILVER—Per oz., Troy: London, 27¾d (standard ounce, 925 fine); New York, bar silver, 60¾ cts. (1000 fine); San Francisco, 60¾; Mexican dollars, 48¼c.

United States—	1898.	1899.
Gold imports	158,163,952	51,194,964
Gold exports	16,194,954	45,379,411
Silver imports	29,131,380	30,844,981
Silver exports	53,797,104	53,461,737

The fact that the East Indian Government will have to buy silver stimulates demand. Indications that the silver reserve of the Indian Currency Department has been heavily depleted and will be further reduced are found in the large sales of telegraphic transfers upon India, further earmarking of gold for the account of the Indian Government and the dispatch of gold direct to India. Out of 16¼ crores of cash reserve only about 7 crores are silver. According to the Statist, should a further two millions of gold be sent to India during the next two months, the silver holdings of the Indian Government will probably be reduced to about 4 crores. Before such a figure is reached, purchases of silver for coinage ought to be made, unless the Indian Government is prepared to incur risks which might bring disaster. The Statist insists the Government must buy silver without delay and have it coined as quickly as possible, and reasons that India ought not to be subjected to further trials on top of the famine, also pointing out that if troubles break out on the Afghan frontier, silver alone will be usable.

COPPER.—New York, Lake, $16.25; electrolytic, $15.75; casting, $16.00; St. Louis, $16; San Francisco, 17½@18.

UTAH and CALIFORNIA

Are two of the most magnetic names in the roll of States, and the best way to reach them is over the Rio Grande Western Railway, "Great Salt Lake Route." As the name intimates, the Rio Grande Western is the only line that passes directly through Salt Lake City on the way to California; and Salt Lake City and the Great Salt Lake are the two points which should certainly not be missed on your western trip, as they contain more interest to the average American than any two other points within the confines of the United States. Study the matter carefully and you will choose the Rio Grande Western for this reason as well as for the magnificent scenery, superb equipment and fast time. It is the popular route during the winter as in summer. Write to GEO. W. HEINTZ, General Passenger Agent, Salt Lake City, for particulars.

A Good Endorsement.

The British Government has recently adopted the Cross Oil Filter, manufactured by the Burt Mfg. Co. of Akron, Ohio, and ordered large quantities for various branches of the Government service. This is a strong endorsement, as the English makes are plentiful and cheap. The Burt Co. state that their business for 1899 increased over 50% above previous year.

Quicksilver

——FOR SALE BY——

The Eureka Company,

OF SAN FRANCISCO.

ROOM 1, - 426 CALIFORNIA STREET,

SAN FRANCISCO.

Quicksilver

For Sale in Lots to Suit.

REDINGTON & COMPANY, Wholesale Druggists, 23-25-27 Second Street, San Francisco.

M. S. HAUSER,

Room 39, 3 California St., San Francisco, Cal.

Will act as purchasing agent for mining companies.
Will use the benefit of his wide experience in getting the best articles at the lowest prices, securing low freight rates, and prompt delivery.
Will submit estimates on all kinds of supplies.
Will work for either a small salary or a commission, and show a saving greatly in excess of charges.

Wealth Producers.

Copper mining has been more profitable than any other business undertaking.

STATISTICS SHOW THE GREAT RESULTS. WRITE FOR PAMPHLET.

COLONIAL COPPER COMPANY,
32 Broadway, N. Y.

WE BUY very rich Ores, Dental Scraps, Tellurium Ores, Mill Wastes, Jewelers' Sweeps, Gold Retorts, Old Iron Retorts, Base Amalgam, Quicksilver, Amalgamated Plates, Gold and Silver, Old Slags.

A. M. DONALDSON & CO.,

ASSAYERS AND WASTE PRODUCT SMELTERS,

1661 Larimer St., Denver, Colo.

Write for Donaldson's Assayers' Slag Hammer.

Experienced Mining Engineer (age 40) reports on mines and their economical development; ore dressing; processes; mining machinery and mill construction. References. P. O. Box 971, Denver, Colorado.

WANTED.

Wanted.—Experienced Metallurgist and Assayer.

A practical as well as theoretical knowledge of the treatment of ores by all the principal methods necessary. Address W, Mining and Scientific Press.

Wanted.—A Young Man Who is a Machinist and Pattern Maker.

Good wages. Steady employment. Address NELSON IRON WORKS, Nelson, B. C.

WANTED.—An Experienced Quartz Mine Superintendent, one who is familiar with stamp mills and concentrators, and who is also an assayer and mining engineer, to take full charge of mine and 10-stamp gold mill. Must furnish references, state salary, and particulars. Address "GOLD, Mining and Scientific Press, San Francisco Cal

WANTED—A Second-Hand White Howell Roaster, also a Revolving Drier.

Must be in good repair. Address ARTHUR HENDEY, Agent, Copper Chief Mining Company, Jerome, Arizona.

Wanted.—Foreman for Twenty-Stamp Mill.

One hundred and fifty dollars per month and board. Address THE WM. HAMILTON MFG. CO., 316 S. Euclid Ave., Oak Park, Illinois.

WANTED.—A STAMP MILL MILLWRIGHT.

Permanent position; salary $1800 per year. Address F. T. SNYDER, The William Hamilton Mfg. Co., Nelson, B. C.

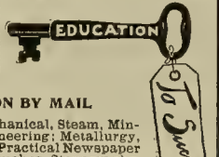
WANTED.—A COMPETENT MILL MAN

Who can take the machinery for a 10-stamp mill to a foreign country, erect same and run it for six months or longer. State experience, references and salary expected. Address all replies to W. L. L., care of the Editor of the Mining and Scientific Press.

SITUATIONS WANTED.

Wanted.—Situation as Mill Foreman, Assayer or Superintendent of Mine.

Have long experience. Address J. O. STEWART, Danville, Cal.



ASSAYER

WANTS POSITION. Good references. Competent in other branches of mining. Address J. D. H., care this office.

Mining Engineer and Metallurgist, technically educated, with fifteen years of practical experience, is open for a new engagement as expert or superintendent. Specialty the treatment of rebellious silver and gold ores. Experienced in designing, building and running reduction works. Speaks and writes Spanish fluently. Address ALPHONSE BENO, P. O. Box 814, City of Mexico.

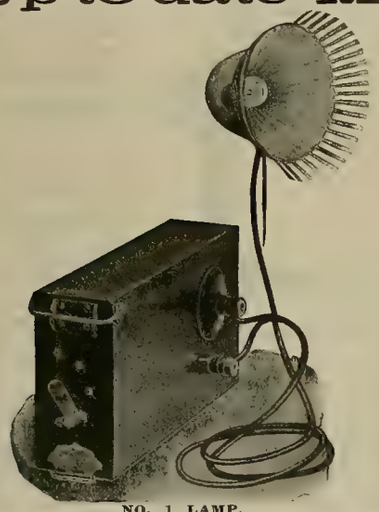
34-36 STEUART ST., SAN FRANCISCO, CAL.....AGENTS FOR PACIFIC COAST.

General Arrangement of Pelatan-Clerici Plant.

The "Pelatan-Clerici" Process



OF TREATING REFRACTORY ORES

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

Up-to-date Miners who value their lives use

NO. 1 LAMP.

McINTYRE'S DRY BATTERY

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:

For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored, where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

No. 1 weighs 2 lbs., 1½ C. P.	Price complete, $4.50.	For meter reading only.
No. 2 " 3 " 4 "	" " 6.00.	For Miners and general use.
No. 3 " 1½ " 10 "	" " 12.00.	For several persons to work by.
No. 4 " 3 " 4 "	" " 6.00.	Boiler Makers and Chimney Sweeps.

SAMPLE LAMP SENT ON RECEIPT OF PRICE. Illustrated Catalogue is yours for the asking.

30in. x 72in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

WHITE, ROGERS & CO.,

Contracting Engineers and Millwrights,

OFFICES, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

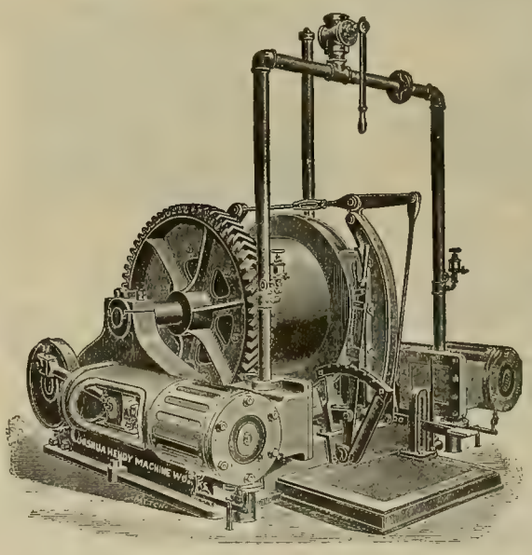
PRICE, $450, F. O. B., San Francisco.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.



These Machines are Kept in Stock Ready for Immediate Shipment.

MINING AND MILLING MACHINERY.

DOUBLE CYLINDER SINGLE DRUM HOIST.

THE above form of Hoist has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post-brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

PATENTS

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO'S PATENT AGENCY.

330 Market Street, San Francisco, Cal.

The above illustrates the "Union" 25 H. P. double cylinder divided drum mining hoist for double compartment shaft. Cages and cars balance each other, therefore power is only used to raise ore; cost of hoisting ore is therefore reduced to the minimum. Made in sections for mountain transportation.

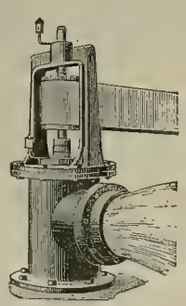
RIVETED STEEL WATER PIPE
RISDON IRON WORKS BEALE & HOWARD STS.
MANUFACTURERS SAN FRANCISCO, CAL.

All sizes of Steel Water Pipe for City and Town Supply, Placer, Hydraulic and Quartz Mining. Cut, punched and rolled to be riveted at destination or made up complete.



We make a specialty of all kinds of Heavy Sheet Iron and Steel Work. Plans and Estimates furnished.

An Extraordinary Offer! $6, *for a short time only.*

We make this offer so as to put **The Little Alaska Gold Washer** into every mining camp in this country. **Don't fail** to take advantage of it; it will save you **time** labor and **money.** It will save its cost in a **few days.** Just the washer for Cape Nome. Just the washer for the poor man, who has not the money to put in expensive machinery. It will do the work of **10 men** with gold pans. Just the washer for the prospector; it weighs only 7½ **lbs**; taken apart it takes up no more room than the gold pan. **Don't wait; order at once.** As we say, it is only for a short time. RUSSELL & KINSEY, 204 So. Broadway, Los Angeles, Cal. *When ordering please mention this paper.*

For Sinking

Wood's Propeller Pump

Stands pre-eminent. No gearings, valves, cylinders, plungers, exposed bearings or packings. There is economy, convenience and rapidity in sinking with this unique and reliable pump. Send for Catalogue.

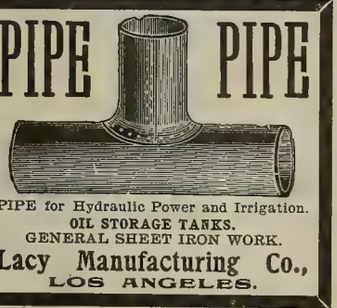
THE COLORADO INCANDESCENT LAMP.

Coiled filament;
Even distribution of light;
Full rated candle power;
Exact efficiency ordered;
Long life;
Low in first cost, cheapest in the aggregate.

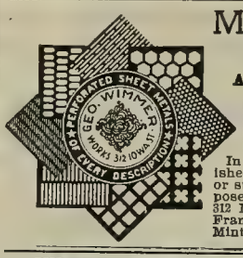
SEND FOR PRICE LIST.

THE COLORADO LAMP CO.,
DENVER, COLO.



This cut illustrates our 4 H. P. to 8 H. P. **HOISTING PLANT.**

Larger sizes built to suit the demands of our customers.



It is strong and exceedingly simple and durable, being entirely under the control of the operator, by the use of a single hand lever for hoisting, while the lowering is governed by a foot lever and brake. No better device has been designed for this purpose. For prices and further information address the builders.

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS CONSTRUCTION. | SAVES FINE SULPHURETS.

WITHOUT LOSS IN TAILINGS.

MAKES HIGH PRODUCT. | CAPACITY FROM 5 TO 10 STAMPS.

P&B BUILDING PAPER

The walls of a house are built for protection. If the sun and weather open up the sheathing, the rain or the air will get in and cause discomfort and doctor's bills. To prevent this the architect or builder uses building paper. There are many kinds, but only two classes—the poor and the good. P & B PAPER is good—the best. It is very strong, odorless, waterproof and airproof, and will not rot. Ask your dealer for samples, or write us for them. We are the makers.

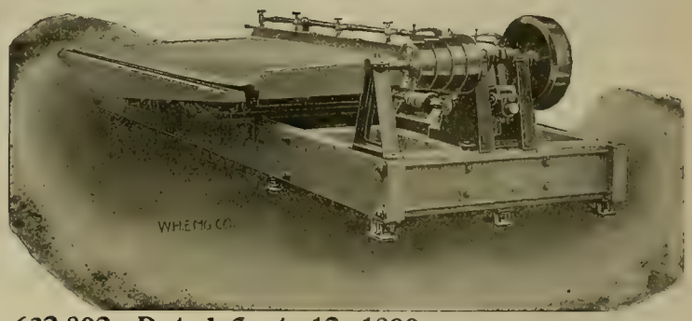
We also manufacture all kinds of Ore Milling Equipments for Amalgamation, Concentration, Cyanide and Chlorination Processes.



(SEE PAGE 137.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

We have reports from mills employing Cammett concentrators for the treatment of ores containing galena, iron sulphide and zinc blende, that they are regularly producing on each table three distinct concentrates—one of galena, one of iron sulphide and one of zinc blende, each of which is commercially clean.

Practical experience with the Cammett concentrator proves that it **saves** and **delivers** into the **concentrates box** slimes so fine that to prevent them from being lost from the **concentrates box** it is necessary to provide several additional overflow tanks.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

ASSESSMENT NOTICES.

SOUTH PALOMA GOLD MINING COMPANY, Limited.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Directors, held on the 6th day of December, 1899, an assessment (No. 1) of six-tenths (6-10) of a cent per share was levied upon the capital stock of the corporation, payable immediately to the secretary, John F. Barnett, at Room 22, No. 222 Sansome St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of February, 1900, will be delinquent and advertised for sale at public auction; and unless payment be made before, will be sold on the 19th day of February, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

JOHN F. BARNETT, Secretary.

Room 22, No. 222 Sansome St., San Francisco, Cal.

QUINCY MINING AND WATER COMPANY.—Location of principal place of business, San Francisco, California; location of works, Spanish Ranch, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2nd day of January, 1900, an assessment (No. 2) of forty cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 439 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of February, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

THOMAS QUIGLEY, Secretary.

Office—No. 439 California street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of January, 1900, an assessment (No. 10) of five cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission St., San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of February, 1900, shall be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission St., San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of January, 1900, an assessment (No. 22) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of February, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 19th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of January, 1900, an assessment (No. 2) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of March, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, room 36, San Francisco, California.

DELINQUENT SALE NOTICE.

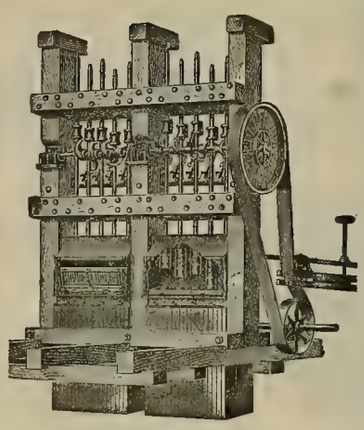
MAY DAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 29th day of November, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Fanny Mayblum	61	50	$5 00
J. P. E. Heintz	57	1,000	100 00
J. P. E. Heintz	116	125	12 50
J. P. E. Heintz	129	4,000	400 00
J. P. E. Heintz	134	500	50 00
J. P. E. Heintz	135	200	20 00
Wm. A. Junker	71	500	50 00
Annie D. Weeks	133	500	50 00
C. G. von Treutler	127	400	40 00

And in accordance with law, and an order from the Board of Directors, made on the 29th day of November, 1899, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, Heald's Business College, 24 Post street, San Francisco, California, on TUESDAY, the 20th day of February, 1900, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. P. HEALD, Secretary.



Office—Heald's Business College, 24 Post street, San Francisco, California.

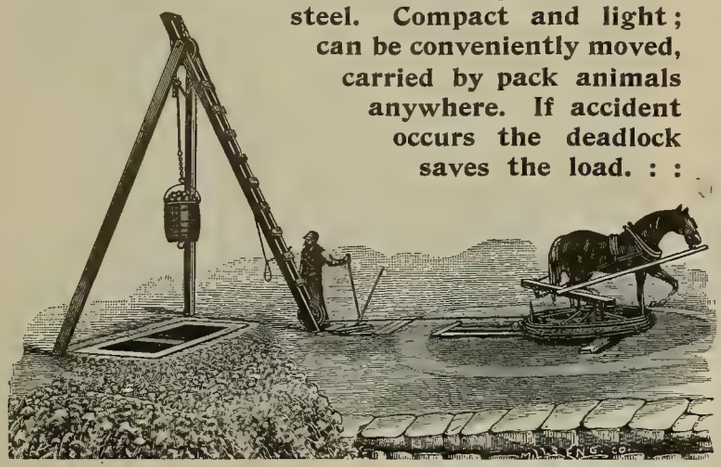
DETROIT, MICH.

Why Detroit Lubricators Should Be Preferred.



In addition to their many other good qualities, the Detroit Lubricators are made extra strong and heavy, each one being tested at a pressure of 300 lbs. to the square inch before it is allowed to leave the factory. This is probably twice as high a pressure as they will ever have to work under, so they are very durable and longlived, and, unless injured by accident, will not require any repairs for years. For this reason, they are particularly well adapted to users in the Rocky Mountain district and on the Pacific Coast, where it is expensive and inconvenient to get repairs. Our catalogue showing our different styles of sight feed lubricators, glass and brass oilers, oil pumps, oiling devices, etc., will be sent on application.

No. 2066. — VOLUME LXXX. Number 6. SAN FRANCISCO, SATURDAY, FEBRUARY 10, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

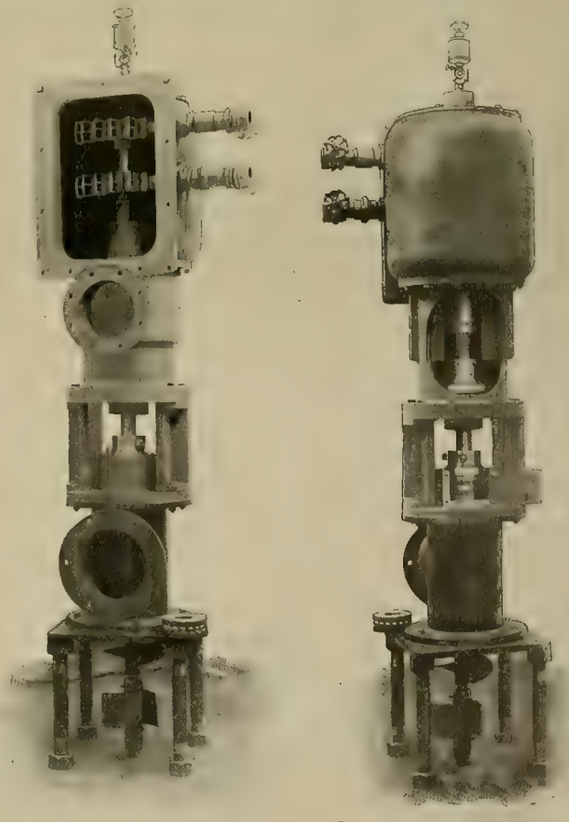
An Idaho Silver-Lead Concentrator.

About one mile west of the town of Mullan, Shoshone Co., Idaho, is a silver-lead concentrator, depicted herewith. Shoshone county has in the past year been unpleasantly prominent in connection with destruction of mining property and long-continued labor troubles. It is here given prominence of a more pleasant kind in the possession of what is said to be the largest silver-lead concentrator in the world.

The main portion of the building covers a floor space of 92x165 feet, with conveyor house, crusher house and an ore bin of 1200 tons capacity. The machinery consists of a Blake crusher 9x15, two conveyors to two No. 4 Gates crushers, two 14-36 Allis crushing rolls, two 14-29 recrushing rolls, eight 3-compartment double jigs, eight 4-compartment double jigs, four sets 14-29 fine crushing rolls, four 5-foot Huntington mills, eight double-deck round tables, ten double-deck Wilfley tables, and six 6-foot Frue vanners with settling tanks. Power is supplied by two 6-foot Pelton wheels under 900 feet pressure, and one 20-inch Leffel wheel under a pressure of 40 feet, with an auxiliary steam plant consisting of two 100 H. P. boilers and a 16x42 Corliss engine for use in time of low water or accident to water line. The plant is heated by steam and lighted by electricity. The daily milling capacity is about 700 tons of crude ore, producing about seventy tons of concentrates, which assay 48% lead and fourteen ounces silver to the ton. William Nichola is mill superintendent, Thomas Cox resident manager.

The ore is a silver-lead product and is mined through a series of tunnels, aggregating 10,000 feet in length, which connect by tramway to a level of the railroad from the mill. The average assay of ore mined is 5% lead and one and a half ounces of silver to the ton, the low grade of ore necessitating handling and working in large quantity. At the new tunnel, No. 5, on a level of the railroad, is an air compressor and storage bin of 3000 tons capacity. The mine gives employment to about 250 men. Joseph Carson is superintendent of the mines. A railroad, two and three-fourths miles in length, with a 7% grade, equipped with a fifty-ton Shay locomotive and twenty-ton ore cars, connects the mine and concentrator. The mine has had a fluctuating history. Located in '84, after little development it sold for $25,000, opened up, and operated till the failure of its owners in '90, then bought by a Milwaukee concern who failed to make it profitable, leased in '94 with untoward success, again leased in '95, a new concentrator built which, destroyed by fire in '98, was replaced by the present one which has been in active and profitable operation since August 15th, '98, under the ownership and operation of Montana miners.

To the courtesy of Mr. P. L. Orcutt of the Mullan Mirror we are indebted for the use of the engraving.



Concentrator Morning Mine and Mill, Mullan, Idaho.

A Propeller Mining Pump.

The accompanying illustrations show a Wood's No. 10 propeller pump direct connected to a Pelton water motor, lately installed on the 150-foot level of the Little Jamison mine, Johnsville, Plumas Co., Cal., of a capacity of 1800 gallons per minute, now pumping from a depth of 60 feet. Sinking will be continued in the shaft with the aid of this pump. In the cut on the left is shown the opened case which contains two 15-inch Pelton wheels on a 2½-inch turned steel shaft, which work under a head of 500 feet, developing 55 H. P. at a speed of 1500 revolutions per minute. The steel shaft runs in phosphor bronze bushings and is direct connected through a coupling to a double set of ball and disc bearings, which in turn is direct connected to the vertical shaft of the Wood's pump, extending 60 feet down the mine shaft in 10-inch oil well casing. Between the four uprights at the bottom of each picture may be seen one of the pump propellers and its guide, located at intervals of 5 feet along the shaft in the casing. The propellers revolve with the shaft; the guides engaging tightly against the casing hold the shaft in line and deliver the water from its whirling motion to a straight upshot and into the face of the propeller above. There is also shown one of the ball bearings. The greatest diameter of the pump head and motor is 20 inches; that of the discharge and pump casing is 10 inches. The entire weight of pump, motor, casing, shafting and discharge pipes is 4000 pounds. No priming is required, it being only necessary that the bottom propeller is in the water when the pump is started.

The propellers are located every 5 feet, and the same speed is used for the same amount of water through different heights. The manufacturer says it may be run slow enough to pump but a few gallons per minute; that the admission of air from top or bottom does not stop the pumping; an increase of speed will increase the rated capacity without the runners slipping or churning the water, and that sand and gravel may be pumped, with but a minimum of wear, without the pump becoming choked. The representative, L. G. Harrison, 31 Main street, San Francisco, Cal., has one of these pumps in practical operation at his establishment.

Mine Values.

An essential difference between a mine and other kinds of property, from the investor's point of view, is that, in the minds of many, a mine, from the day the first dollar is realized from it to the day it is abandoned, is viewed as a constantly depreciating property. This is considering the legitimate investment, where it is expected to find profit between the yield and cost of production. Of course, in those instances (lamentably too frequent) where the primary intent is to direct the influence of the substantial qualities of a mine to the "boosting" of stock, it is of less importance to take into account the probable life of a mine. In such cases there is more money won and lost in a few months than, ordinarily, the mine ever produces.

Although the purchase of property other than mines may not prove a profitable investment, there is left, presumably, at the wind up, something to represent the original investment. This cannot be said of the mine which proves a failure for lack of ore. Unless it pays a margin of profit, it has absolutely no value and cannot be honestly transferred to other hands willing to undertake its operation in the hope that superior management or other means will make it pay.

It is often asked by the vendor of a mine why an investor requires a mine to yield results so far above the profits he would expect from other kinds of investment. The above is one of the reasons—the fact that a mine is viewed as a depreciating property and must return in money all that it has cost before it can be considered as an investment of original capital. That a large sum of money can be expended in the purchase or development of a mine, without possibility of recovering any fraction of it should the mine prove a failure, constitutes a risk which justifies proportional larger profits.

An investor buys land or loans money on land, and the land is always there for what it is worth. If he buys a mine and the mine does not return him his original capital, he has no resource. Consequently, the investor, when asked to pay cash for a mine, if he be cautious, will ask a reasonable assurance of a return of his money. Usually, capital employed in mining investments is willing to take its chance for profit on ground ahead, but it generally requires something to secure an original outlay.

The purchase of a prospect for a small sum is a different matter. In that case it is generally an investment on showings beyond which it is impossible to determine anything without spending money, and the risk or gamble is inseparable from it. But it should not involve the outlay of a large sum of money for the privilege of the risk, unless the conditions are exceptional.

Bullion at U. S. Mints and Assay Offices.

Mints of the United States now receive bullion of a much lower grade than ever before in the history of coin-making in this country. This not only permits of the sale of their product to the Government by a vastly greater number of mines, but the mints will take in more silver in alloy with the gold bullion than has ever before been permissible. According to the order of the Treasury Department, mints will take bullion 300 fine in gold hereafter. Ever since the establishment of the Denver Mint no bullion less than 500 fine was accepted. Most of the gold bullion offered to the mints is alloyed with silver in the greatest proportion. The acceptance of a lower grade of gold bullion, therefore, means the purchase of just that much more silver by the Government. Heretofore the quantity of silver in bullion was limited to 50%. Now there can be 70% of silver if there is 30% of gold. Officers in charge of the Denver Mint say the order will affect hundreds of mines in this section. The proportion of bullion running 30% in gold and the balance in other metals is vastly greater than that containing 50% of gold. Hence the Government gives those who have low-grade ore a chance. Under the old rule the officers in charge of the Denver Mint were compelled to refuse a great deal of bullion. In fact, there was more refused than accepted. This bullion went to the assayer, where almost any grade is accepted, but the man offering it pays a good fee for the refining of his metal. There will be but very little difference in the refining fee at the mint under the new rule, say the officers in charge.

The above is from a Denver, Colo., paper and is being widely quoted. From every quarter come questions to this office as to its correctness.

The subject is of sufficient importance to justify extended notice. The statement is misleading, as it implies, practically, the free coinage of silver without an Act of Congress to authorize it. The matter was referred to Mr. Chas. G. Yale, the statistician of the U. S. Mint at San Francisco, who shows that the mints and assay offices have always received bullion of 500 fine and over and have paid the depositor for his silver at the rate fixed by the authorities in Washington, which is at present 53 cents per ounce, and for the gold at its full value. They also receive and part bullion of 300 fine, but do not receive and purchase it. For the silver in these low-grade deposits the depositor is given fine silver bars for the amount of fine silver in his deposit, but the Government does not purchase the silver or give coin for it, as it does in the case of bullion of 500 fine. The only change made has been in the charges.

The item referred to was based probably on a misunderstanding of the recently revised charges for melting, refining, etc., at U. S. mints and assay offices as fixed by the director of the mint and approved by the Secretary of the Treasury last month. The rates under this new schedule show a large reduction in the charges, and it will naturally be a matter of interest to mining and mill men to know exactly what these are.

As to the melting charge, a charge of $1 is imposed for each melt of bullion except in the case of uncurrent U. S. coin and fine mint bars.

For parting and refining bullion the rate per ounce gross is as follows:

On silver bullion containing less than 300 thousandths of gold, three-fourths of one cent per ounce (heretofore this has been two cents per ounce); on bullion containing from 300 to 500 thousandths of gold, two cents per ounce; on bullion containing over 500 thousandths of gold, four cents per ounce. Silver allowed the depositor is calculated on the basis of refining the gold to 990 thousandths. When bullion contains less than three-tenths of a thousandth of gold it is not reported for the benefit of the depositor. Base bullion containing less than 300 parts of gold per thousand pays a charge of two or three cents per ounce, or such material may be declined, at the discretion of the chief officer. If the alloy be all good copper when but one of the precious metals is present, the charge may be one-half cent per ounce.

For refining silver the rate per ounce gross is as follows: A refining charge of three-tenths of a cent per ounce is imposed upon silver bullion free from gold, assaying from 998 to 998½, and a charge of four-tenths of a cent upon such bullion assaying from 980 to 997½. Bullion below 980 is subjected to the parting or refining charge of three-fourths of a cent per ounce.

The "toughening" charge is made to cover the cost of fitting brittle fine bars for coinage operations, and is not imposed upon unparted bars except in special cases, where it is necessary to toughen an unparted bar returned to the depositor, or when the bullion contains iridosmine, etc. This charge is on gold bullion ¼ cent to 2 cents per ounce gross and silver bullion ¼ cent to ½ cent per ounce gross.

The bar charges on bullion deposited for fine bars not required to be parted or refined, and for standard or unparted bars, are as follows:

Bars of fine gold per $100 value	$0.04	
Bars of fine silver per ounce	.00½	
Bars of standard gold per $100 value	.10	
Bars of standard silver per ounce gross	.00½	
Bars of unparted bullion per ounce gross	.00¼	
Small gold bars (less than $5000)	.05	per $100
Small silver bars (less than 125 ounces)	.00¼	per ounce

The "copper alloy" charge is 2 cents per ounce for the copper required.

Assessment of Mining Stock.

As in Colorado so in Utah regarding the assessment feature of mining companies, it is becoming generally recognized that the assessment plan, as in vogue in California, is an essential part of a working mine's make-up. It has long been a favorite with companies having stock for sale to be able to advertise "stock is non-assessable," conveying the idea that purchasers of stock have no further likelihood of expense, but for mines that are to be worked there is no better system of securing funds therefor devised than that of levying assessments when necessary. So that we note in the States mentioned and elsewhere a growing disposition toward the assessment plan. Of course where a mine owned by a corporation can be developed without levying assessments it is ever so much better, the same as in any other form of business; but, as in any other form of business, where money must be forthcoming to carry on the work there is no better financial method than to levy an assessment. Where no assessment can be levied, a mining corporation in need of money is in constant danger, is dependent upon the whim or fancy of a few recalcitrant or timid stockholders, and is never master of the situation. The objection to placing the power of assessment in the hands of the directors of a mining company is fear of misuse or abuse of that power.

Not infrequently assessments have been levied that were unnecessary, unjust, and savoring strongly of dishonesty. The knowledge of this abuse of power, trust and opportunity has made many fear that feature of the mining business. But in the mining business, as in any business, there must be trust and confidence somewhere, and an assumption of good faith; and because an exception is occasionally noted that should not work against the observance of so generally good a rule. After all, the personal equation, the honesty of the individual, underlies the whole thing: somebody must be trusted, no matter what the business, and that such trust is occasionally betrayed is more the misfortune of that particular company than the fault of so salutary a rule.

We look to see a general growth in the belief that the assessment system affords, ordinarily, a safe and certain plan for the provision of funds to carry on the development of a mine and its preservation from debt or vexatious relinquishment.

In the last three issues appear detailed accounts from one of our special representatives of what is being done in gold quartz mining in one of California's thirty-seven mining counties. Tuolumne is a good average example of a California gold mining county. It has furnished to the world $211,000,000 gold, and s but surface scratched. The same may be said of several other counties of California, commonwealths in themselves, that have yielded great store of gold, and which by deep mining will add still greater amount to the gold output. California has produced gold so much and for so long a time that it would naturally seem to the world that so great a gold-yielding area should show signs of exhaustion. What California has for fifty years under, sometime, crude conditions turned out is but a small part of what remains.

It has been asserted with some show of truth that the U. S. Geological Survey was and is opposed to the movement looking to the creation of a Cabinet Department and a Secretary of Mines and Mining. Without assuming to speak for that branch of the public service, this paper is able to say that the Geological Survey is in hearty accord with the movement and favors the furtherance of the mineral industry which would result from the creation of such an executive branch.

Concentrates.

ONE is not entitled to rescission of a contract who is unwilling to perform his part of the agreement.

MARINE steam engineers only are required to have a license. The Federal Government has supervision over them.

THE longest telegraph line in the world is believed to be the one between Derby and Cape York, Australia, 7246 miles.

MOMENTUM is the weight of a body multiplied by its velocity, usually in feet per second, and denominated in foot pounds.

WITH 100 feet head and 50 inches water there should be 12 H. P. In California a miners' inch is about 1½ cubic feet per minute.

ON April 17th, '95, the London price of silver was 30⅛d (925 fine); New York, 67½ cents (1000 fine); commercial value in $1, .522 cents.

THE borrowing of money which the borrower knows does not belong to the lender is conversion, for which both are liable to the real owner.

A BAR of round steel, 6 inches diameter, 12 feet long, would weigh 1156.32 pounds. A similar bar 3 inches diameter would weigh 289.44 pounds.

A CUPEL, whether old or new, will not be likely to spurt if heated up first and then the muffle opened for a few moments so that organic matter roasts off.

A WIND velocity of forty miles an hour occasions a pressure on a vertical surface of 6.65 pounds per square foot; of fifty miles per hour, 10.06 pounds per square foot.

A WELDING STEEL mixture, recommended, is 1 part sal-ammoniac, 10 parts borax, pounded together, fused till clear, then poured out, and, when cool, reduced to powder.

THE estimation of sulphides and cyanates in commercial cyanide, the determination of the purity or value of cyanide of potassium, is a matter for a competent analyst.

A RAILROAD receiving freight destined to a point beyond its own line is only bound, in the absence of a special contract, to safely carry on its own route and deliver it to the next connecting carrier.

AN 850-pound stamp dropping ninety-five per minute needs 1¼ H. P.—for each stamp in the battery. Water needed for each stamp per hour averages seventy gallons; for an ordinary concentrator about 250 gallons.

AS BETWEEN flat and round hoisting ropes, each has its adherents; with a flat rope a smaller engine can be used. Michigan, Pennsylvania and Colorado favor round rope; Montana, California, Utah and Nevada favor the flat.

A MINE FAN works harder when drawing in fresh surface air from the atmosphere, and, therefore, makes fewer revolutions in a given period than when it draws in the thinner and warmer air from underground workings.

A MANILA ROPE, 3-inch circumference, .955-inch diameter, weighs .297 pounds per foot, has a breaking strain of 6115 pounds, and is safe for a 611-pound load if used for hoisting. One wire rope will outlast three hemp ropes.

THE breaking strain of a plow-steel wire rope 1¼ inches diameter, made of six strands of nineteen wires each, and hemp center, is 150,000 pounds, according to John A. Roebling's Sons' Co.; of 2¼ inches diameter, 480,000 pounds.

TO CONSTITUTE a vein it is not necessary that there be a clean fissure, filled with mineral, as it may exist when filled in places with other matter, but the fissures must have form, and be well defined with hanging and foot walls.

IN almost any situation in life a man's safety depends, primarily, upon himself. In mine work the safety of himself and everybody connected with him depends largely upon his care, intelligence and constant exercise of common sense.

NO ONE outside the incurable ward of an insane asylum should give a moment's serious consideration to a "divining rod" or "dousing stick" or similar device in the hands of any one purporting ability to indicate the presence of mineral in the ground.

A GOOD steam boiler cement for cracks, and to secure joints, is made of litharge 2 parts, very fine sand and quicklime (slacked spontaneously in a damp place) 1 part each, to be mixed and kept from the air; to be made in a paste with clear boiled oil when used.

GILPIN CO., COLO., gold ore not uncommonly carries 15% pyrites; California ore rarely carries more than 3%, hence the difference in the rapid coarse crushing of the latter with a heavy quick-drop stamp, and the slow fine crushing of the former with a light slow-dropping stamp. The Colorado process primarily places amalgamation more prominent.

IN adding bromine to a solution of cyanide of potassium, should too much bromine be added, a solution containing cyanogen bromide, potassium bromide, and possibly free bromine, will be obtained. It is required to have potassium cyanide or other metallic cyanide, as such, present, together with the cyanogen bromide. The dark-colored products resulting from the treatment of cyanide solutions with bromine occur in strong solutions, but are practically absent from solutions of the dilute standard employed in practise—say, of 0.3% potassium cyanide, downward.

AT the Baliol G. M. Co.'s mill, Sutter Creek, Amador Co., Cal., forty 850-pound stamps have crushed 5885 tons ore in 27½ days—a daily average of 5.35 tons per stamp per day. Seven and a half tons to the stamp per day is the best California record known to "Concentrates," and was made by G. McM. Ross.

IN two pole dynamos the proportions of ring armatures vary from a length equal to one-half the diameter to a length equal to one and one-half diameters. It is common to make the length equal to the diameter. For drum armatures the length sometimes equals one and one-half diameters and sometimes three diameters. It is common to find the length equal to two diameters.

PROBABLY the best assaying manuals for prospectors, miners and assayers are Aaron's Assaying, Part I, and Parts II and III. The first is a volume sold for $1; the Parts II and III constitute a second volume, sold for $1.50. New editions, rewritten and up-to-date, have recently been issued by the book department of this paper and the books will be sent postpaid anywhere.

ONE INCH OF RAIN falling upon an area of one square mile is equivalent to 17,500,000 gallons — 145,200,000 pounds. If falling from clouds 3000 feet above the earth, this represents an energy of 22,000 H. P. Pumping machinery at 2 pounds of coal per H. P. per hour would require 200 tons coal to raise the water represented by 1 inch of rain on a square mile to a height of 3000 feet.

NON-RESIDENT creditors of a corporation in the hands of a receiver, if they are not residents of the State in which he is appointed, are held to have the same right that domestic creditors have to contest the receiver's title to property, and are not estopped from pursuing attachments in other States, by filing a claim with the receiver, where they expressly reserve their rights under the attachments.

ASSUMING the truth of the assertion that caves in old and abandoned mines occur more frequently at midnight than at any other time, and that there is an increased flow of water at night, occasioning it necessary to run a pump somewhat faster, the theory as to the cause might be that both those effects were caused by the position of the sun on the other side of the globe, thus increasing to a slight degree the force of gravity.

THINK over something you've done in mine work, something that you think was well done, a profitable experience, and, with the thought "my light is none the less for having lighted my neighbor's," send the editor of this paper an account of it. Describe it as though you were telling a fellow-miner about it; if convenient send a sketch of it. No one cares particularly for style or "fine writing." What is wanted are the facts.

MINE WATER is ordinarily objectionable for feeding boilers because it is likely to contain acids and sulphates destructive in their action. Sulphate of lime forms, occasioning scale; corrosion or pitting below the water line is primarily caused by the action of a free acid. The reagent for ammonium sulphide is, approximately, bicarbonate of soda. Sulphate of copper will produce complete reaction, forming sulphate of ammonium and sulphide of copper.

"CONCENTRATES" can not give a regular, exact or uniform statement as to the increase of temperature with depth. Conditions vary. On the Comstock, in Nevada, is found one extreme; in the Calumet & Hecla, Lake Superior region, is the other extreme. In the latter, at a depth of over a mile, the temperature is sometimes lower than on the surface. The subject has been given great research. In English and Belgian mines the average increase is about 1° F. for every 50 feet.

"PORPHYRY" is a handy and convenient name for a rock of which one does not know much. It is easy, and, generally, safe, to call it "porphyry," and let it go at that. Petrography is not as yet an exact science, and the precise shades and fine distinctions of difference between different "rocks" approximately of the same "species" are not of overshadowing importance. Any recent elementary work on mineralogy will give as much information on this subject as one can assimilate or find necessary.

J. M. WHITELOCK, of Boulder, Colo., who is afflicted with heart trouble, can take a little pronged stick and point out the man who has the most metal money in his pocket, tell just where the pocket is, and whether the money therein is copper, silver or gold. He can also trace hidden ore veins in all their dips, spurs, angles and sinuosities, and is locating claims for miners. He is bothered most to death by men who want claims located, and has organized a company with a capital stock of $300,000. So J. M. W. says.

TO FIND the horse power of a common slide valve engine: Multiply the square of the diameter of the cylinder in inches by 0.7854, and this product by the mean engine pressure, and the last product by the piston travel in feet per minute. Divide the last product by 33,000 for the indicated horse power. In the absence of logarithmic formulæ or expansion table, multiply the boiler pressure for ⅝ cut-off by 0.91, for ½ cut-off by 0.85, ⅜ cut-off by 0.75, ¼ cut-off by 0.68. This will give the mean engine pressure per square inch near enough for ordinary practise, for steam pressures between 60 and 100 pound, always remembering that the piston travel is twice the stroke multiplied by the number of revolutions per minute.

THE limits of electrolysis are deducible from the assumption that the chemical energy which disappears in a cell reappears entirely in the form of electrical energy. Knowing the heats of formation, and the solution of the various substances which can take place in an electrochemical reaction, one can calculate the resulting E. M. F., and, conversely, it is assumed in any electrolytic process the electrical energy which disappears in the electrolytic cell reappears entirely in the form of energy of chemical separation.

IN the process asked about by H. T. L., Loomis, Wash., a solution of bromide of potassium is electrolyzed and thus is produced an ankaline solution which contains hypobromide and bromate, which is capable of dissolving gold. The crushed ore is treated with an excess of this solution by rotating cylinders. The solution is then filtered, the gold precipitated by passing over a mixture of iron and coal, and the solution, which now contains bromide of potassium mainly, is once more electrolyzed, and again used for extraction.

FOR a shaft 900 feet deep, the cage and load weighing four tons, the requisite size of the steel wire rope can be determined by the following formula: Assuming a rope 1 inch in diameter, such rope 900 feet in length would weigh 1350 pounds. A steel rope 1 inch in diameter has a safety strain for hoisting of four tons, and the safety strain for rope and load would be 8000 — 1350 or 6550 lbs. The stated load without the rope is 8000, so that the square root of 8000 ÷ 6650 or 1.1 would be the diameter of the required rope in inches.

THOS. A. EDISON says that why 110 volts became the standard for lighting circuits came about in this way: In his primary work in electric lighting he always allowed 10% for errors, leakage, etc., and when one of his assistants suggested that 100 volts be made the standard, Mr. E. said, "Just add 10% as usual, and make it 110 volts," which set the standard at that arbitrary figure. The extended use of the three-wire system, which gave 220 voltage between the positive and negative wires, made the last named figure the standard for the early motor work.

A MAN can breathe and exist best at the normal atmospheric pressure of 30 inches of mercury, equal to 14.72 pounds per square inch. He can barely exist at a height of seven miles, where the pressure is only one-quarter of that at the surface of the earth. A man can breathe and work for some hours under a pressure of 2½ atmospheres, or 37½ pounds per square inch, as in a diving bell, but under a greater pressure paralysis may be produced. Work was done at the St. Louis, Mo., bridge by men under a pressure of over four atmospheres—63.7 pounds per square inch.

'TIS TRUE that "fools rush in where angels fear to tread," but occasionally one emerges a little higher than the angels. Ofttimes the "foolish" experimenter of today is the famous (because successful) scientist of to-morrow. Without experiment there is no advance; without discontent with old or present methods, no progress; without original research, no lasting good. The electric light, the cyanide process, the 5000-foot deep shaft, were all "theories," "experiments." Being accomplished facts they are applauded, copied, used. Let us not be too hasty in criticising the experimenter and theorist.

IF a mine were making 50 cubic feet water per minute, and had a sump that would hold twenty-four hours accumulation, and a pump that would raise it in fifteen hours, the supply being cut off, it would take the pump forty hours to empty the sump if the water were allowed to continue running into it at the rate stated. The sump holds 72,000 cubic feet water. If the pump drains it in fifteen hours its capacity is 80 cubic feet per minute. If 80 cubic feet is pumped out every minute and 50 runs in, if the water is allowed to continue running in, the pump would take 72,000÷30, or 2400 minutes, or forty hours to unwater the sump.

THE smelting trust organized last spring owns twenty-three plants, nine of which are in Colorado. No Pacific coast smelter is in the combine, declining any overtures thereto. The trust has outstanding $27,400,000 each common and preferred stock. The output since the consolidation has been curtailed by strike of employes. The nine Colorado plants have a daily capacity of about 5500 tons of ore and they employ 4500 men. The smelters' trust is said to pay in wages more than any other single industry in Colorado, not excepting the railroads. The business is at present profitable. Public opinion in Colorado and Utah is against the policy, and competition in the former State is inevitable.

A WIRE ROPE is just like any other machine: it needs care and lubrication. The latter is important; as a lubricant it needs to penetrate all the wires, as a preservative it must be free from acids and must prevent rust, as a protection it should turn liquids and obviate abrasion. Linseed oil is not a good lasting lubricant; a better article is made of tar, summer oil and mica axle grease in varying proportions to suit varying conditions. The tar and oil must be free from acid. Well made, this compound penetrates the wires, prevents rust, and fills the cable, shedding water, keeping the core in good condition and adding 25% to the rope's life. The best way of applying this lubricant is by a small, steady drip, very slowly pouring in a fine stream while the rope is in use.

The Occurrence of Gold.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS, California State Mine Examiner.

In the earlier history of mining the impression generally prevailed that gold only existed in defined veins, that is, in a vein-like sheet of rock readily distinguishable from the country rock which it traversed. Quartz veins are usually so distinctly different from the rocks in which they occur as to be readily recognized by a novice. The first impression that the new prospector forms when he starts out to find a mine is that gold must exist in some particular kind of rock and he inquires what that rock is and is told quartz. He then is shown a piece of white quartz and he considers that portion of his education complete—"gold is found in quartz and quartz is a hard white rock." This becomes firmly fixed in his mind and with this preconceived notion of the environment of gold in veins he starts out, but he does not proceed far before he becomes confused by finding gold in other rocks. One by one he adds to his store of mining knowledge the varied occurrences of gold and he learns that it is found in lime, in sandstone, in granite, in greenstone, in porphyry, in flint, and in every kind of rock of which he has any knowledge.

It soon becomes evident to him that if he is to attain success he must cast aside prejudice for or against any particular formation or rock, and seek gold wherever it may be found. The most perplexing things are met sometimes but each new and strange occurrence presented adds to his knowledge and his chances of success become greater in consequence.

Gold is not wholly confined to veins which are sharply defined but it is also found in massive rocks where the evidence of vein formation is not pronounced—at least, not sufficiently so to be recognized by the inexperienced prospector, though when gold-bearing deposits of this character are worked systematically they are found to have more or less definite limits though these may be very irregular, and in some instances the walls are determined by the economic results of mining operations.

Invariably, gold when found in massive rocks occurs in a zone which has suffered more or less fracture movement and alteration, which may extend over a considerable area, so large, in fact, as to destroy its semblance to a vein. The gold-bearing deposits at Hedges, in San Diego county, Cal., are really large impregnated zones of hornblende schist, very siliceous and varying much in color, being gray, green or bluish, the color being determined by the contained minerals, such as hornblende, chlorite, epidote, etc., but the gold-bearing rock is rarely white. The zones of pay ore are irregular and appear to have been influenced by the extent to which the solutions which deposited the gold and silica have been able to penetrate the rocks from the fissures through which they came from below.

In the Black Hawk mountains of San Bernardino county, Cal., is a large stratum of limestone, which by a series of step faults, thrusts and transverse fractures has been displaced and is now found lying on the mountain side in a series of terraces. The rock has been much fractured by the movements, which must have been violent, and some zones of this rock are crushed into a granular mass. It is stained to a greater or less extent with iron oxide (hematite), which usually occurs as a dust-like coating on the fractured faces of the rock, though sometimes massive as an ore. A great part of this limestone formation is gold-bearing, some portions being much richer than others and there are also small segregated bunches of high-grade ore.

A few miles distant to the eastward the heavy-bedded quartzite of the Gold Mountain mines, in the same range, are gold-bearing to the extent of being pay rock, and some of this rock also is rich. The quartzites, like the limestones, have been crushed by the dynamic forces which are such a pronounced feature of this range of mountains.

In the several counties of the gold belt of California gold occurs in broad zones of amphibolite schist (chloritic and talcose) with little quartz in many instances. Some of these deposits are of great width and should be designated zones rather than veins. The Blue Gouge mine of El Dorado county, Cal., is a zone of slaty rock more than 600 feet wide, in which occurs at intervals small veins of quartz. All of this zone is gold-bearing but low grade.

The great Alaska-Treadwell mine, on Douglas island, Alaska, is a large mass of altered eruptive material largely feldspathic. It is gold-bearing across a zone several hundred feet in width.

In Cripple Creek district, Colorado, the andesite-breccia and granite are each gold-bearing and frequently possess few of the characteristics which distinguish defined veins. The amount of silica in these rocks in some cases is so small that the veins have no outcrops, or at least are not prominent as veins. Cripple Creek is not exceptional in this respect, as similar conditions are found elsewhere.

The ore body of the Homestake mine, at Lead City, South Dakota, on the 800-foot level is over 450 feet in with. It is a hydro-mica schist including numerous veins and lenses of quartz, large and small. If a single one of these quartz veins were to be worked independently there are few of them that would pay, but the great mass when mined as a whole is worked at a profit and has produced many millions of dollars, and will continue to be profitably worked for years to come.

The granites of California in many places are gold-bearing, but this only occurs in proximity to a fissure or vein, so far as observed.

One notable instance of the occurrence of gold came to the notice of the writer some years ago in Calaveras county, California, several miles northeast of Murphys. At the place referred to is an ancient river known as the Fort Mountain channel. It is capped to the depth of several hundred feet by a series of deposits of tufa, volcanic mud, gravel derived from volcanic detritus, and at the top a heavy deposit of breccia. All of the volcanic rock is of andesitic type. It ranges in color from ashy white to nearly black, and in texture from fine sand or mud to coarse fragmental material (hornblende andesite) in a fine-grained tufa. A number of samples of this material were taken and assayed in San Francisco, Cal., each sample showing the presence of gold from a trace to about $3 per ton, and of silver from one ounce to four ounces per ton. The occurrence of the gold might have been attributed to a fragmental origin similar to the placer gold occurring in heavy river gravels in the gold regions of any country, but this theory would not satisfactorily account for the presence of the silver, and the conclusion reached was that this fragmental volcanic rock was really gold-bearing, though to a very limited extent. The assays were not checked but were deemed reliable.

In Colusa county, Cal., some unusual deposits of gold were noted in connection with what has the appearance of siliceous sinter. The occurrence is limited, and the deposit has not been traced to its origin. It will be observed that gold deposits are not confined to white quartz veins, or, in fact, to quartz at all, though more frequently associated with silica in some form than with any other mineral except iron.

Besides the occurrences of gold above noted, it is found in many other rocks, both massive and sedimentary—the latter generally metamorphic. Igneous rocks are commonly gold-bearing, though always in connection with zones of fracture and often of shearing. Dykes are not infrequently gold-bearing to a notable extent, the gold-bearing portions presenting no material difference from the parts which contain no gold. Dyke rocks which contain gold are not always fissured or crushed, being of comparatively limited extent. In such cases the gold-bearing solutions undoubtedly ascended along the plane of the fissures bounding the extent of the dyke—its walls, as it were. Where gold occurs in dyke rocks it is usually found in shoots, in the same manner as shoots of pay rock occur in a vein. In some dykes the pay rock is confined to the vicinity of the walls and in others it is segregated to certain veins or crevices, crossing the dyke from wall to wall and dividing it into a series of floors.

The prospector must pay attention to every sign and to many places where the well known indications are wholly absent, for, failing to do this, he may pass by a deposit of untold value, leaving it for some more observing or fortunate follower.

Outcrops—Croppings.

Written for the MINING AND SCIENTIFIC PRESS by J. P. WALLACE.

That portion of a vein which appears on the surface is called the outcrop or cropping, and the course of such cropping is known as the line of outcrop. The line of outcrop and the strike correspond exactly when the vein is vertical or when the surface of the country is horizontal. With any other inclination than the vertical, outcrops will necessarily vary in position with the irregularities of surface; the lower the angle of dip the more winding will be the course of outcrop, especially where the strike of the vein is crosswise to the gulches and ridges. In locating a claim no attempt should be made to follow the irregular course of the croppings, but it is important that all croppings be well within the boundary lines. Thorough prospecting, therefore, for the line of outcrop should be made. When this is determined, the strike of the vein is made known by extending the line horizontally—on the level—at right angles to the average dip of the vein.

Croppings differ much in appearance and character. Some are very prominent and rise to a height of many feet above the ground, while others are comparatively insignificant. Hard massive quartz, or some of the but slightly mineralized metamorphic rocks, commonly make up the most conspicuous outcrops. Rocks containing a large percentage of metallic minerals decompose and wear away more readily than others. Quartz which is impregnated with iron, copper or lead sulphides is often much honeycombed and disintegrated and seldom furnishes prominent outcrops. Ribbon quartz and banded rocks, because of their loose character, and, therefore, greater susceptibility to atmospheric influences, crumble more rapidly than massive quartz. Lodes containing much fluorspar, calcspar or feldspar decompose easily.

Surface waters, by their oxidizing and dissolving powers, often so completely change the original texture of outcrop zones as to render the identification very difficult. The oxidizing effect of the atmosphere, coupled with that of heavy winds and pelting rains, also materially aid in the surface changes of ore deposits. Certain metallic constituents in an ore are dissolved out and carried through underground channels to the surface, or else allowed to sink to lower levels in the vein where they may be deposited in a more concentrated form; other minerals are reduced to oxides, chlorides and carbonates, and these, together with the unoxidizable and not easily soluble minerals, such as gold and platinum, remain in the porous and honeycombed vein filling. Chemical processes of this kind are called "weathering." The zone of oxidation usually extends in depth to the drainage level of the district. This varies in different districts and in different lodes in the same district; water level is found beyond the influence of alteration.

Lodes seldom outcrop their entire length; usually they protrude only at intervals along the strike and occasionally in but one place. This lack of surface continuity determines nothing as to the horizontal extension of ore bodies in depth. Outcrops vary in width from 1 inch or less to 100, 200 or 300 feet.

Croppings are often very misleading in appearance; the least attractive ones sometimes prove to be the most remunerative. Yellow mud, reddish clays, brownish, blackish, whitish or rusty dirt—all seemingly barren—occasionally astonish the prospector with their high metallic contents. It is generally impossible to estimate with any degree of accuracy the value of such decomposed products without an assay, and this should always be had. Even if low in grade where examined, the present condition makes it probable that a higher degree of mineralization and concentration exist elsewhere in the same deposit and calls for further exploration. Many prospectors rely exclusively upon panning and amalgamation for the determination of gold values, but these are not always trustworthy. In not a few cases clay and talc outcrops show no colors by the most careful panning and yet yield good results by assay. Oxidized iron croppings, rich in gold, sometimes refuse to give up their values to amalgamation, and gold in a finely divided condition is not always saved in the pan.

Alteration of metallic minerals in vein croppings may be partial or complete. When only partially oxidized, these minerals will be found either bunched or scattered in the deposit and are indication of the character of ore likely to be encountered in depth. Gold-bearing surface ores which have undergone considerable alteration are generally higher in grade than the same ores prior to oxidation. Undecomposed gold-bearing surface ores, as a rule, are neither richer nor poorer than the same ones in depth. Oxidation, therefore, is enriching in its tendency. These are well established truths, but they are often very difficult ones for the average prospector and miner to learn.

Surface decomposition in a gold-bearing pyritous ore produces a reddish or brownish oxide cropping, more or less intermingled with fragments of quartz and earthy matter. This is commonly known as the vein capping, gossan or iron hat, and varies in thickness from a few to many feet. Veins of this character are sometimes so extensively decayed that they have in places crumbled to fragments, and the accumulated remains which hide from view the real lode are often so rich in free gold as to be worked with great profit by sluicing, same as placer gravel. Nearly all prominent gold mining camps have furnished examples of this kind. Decomposed croppings are generally wider than the veins they cover.

Galena decomposes to lead sulphate and this in turn to lead carbonate. Croppings of the latter present a white, gray or brownish appearance, but not infrequently they are colored reddish or yellowish from admixture with iron oxides and other minerals.

Quartz carrying decomposed ruby silver is commonly stained a light to dark red color, but when combined with other metallic minerals the color varies.

Weathered zinc ore deposits are commonly indicated by a soft, whitish clay-like outcrop, which contains the zinc in the form of carbonate or silicate. Both are oxidation products from zinc sulphide. The color varies sometimes from greenish to brownish.

Cinnabar ores usually furnish an ocherous-like cropping, resembling reddish oxidized iron ores or red clays, and are often associated with a brownish or black opal and more or less quartz and lime carbonate.

A black, brown or gray cropping is common to many ores. Most of the copper deposits have had a dark brown or blackish outcrop, although a dark red or light brown is not wanting. The blue and green copper carbonates occasionally appear as croppings, and in some instances mark the site of valuable deposits; but, as a rule, a very small amount of these stains a very large rock surface, and, therefore, is often misleading as to the amount of copper present.

The croppings of graphite, chromite, the manganese oxides, manganiferous iron ore and antimony sul-

phide have a black, iron-black or dark steel-gray color.

The hematites, magnetites and iron carbonates vary in color at the surface from brown to reddish and from black to blackish-brown.

Both brittle silver and silver glance, when decomposed, constitute the so-called "black sulphurets" of miners. Surface quartz containing these rich silver ores is often much blackened and honeycombed, and not infrequently black lumps or nuggets of silver occur in the croppings.

Antimonial silver, antimonial sulphide of silver and seleniuret of silver all show more or less blackish croppings.

Horn silver is a secondary product, occurring usually at or near the surface in thin crusts, which are spread over the surfaces of the gangue rock and in minute seams through it, but often in irregular lumps, filling cavities in the gangue. It resembles wax or putty, and is colored greenish, yellowish or brownish, but often is many colored and of an earthy appearance when much decomposed. To one unfamiliar with this ore it appears to be of no value.

Some lodes do not outcrop and these are said to be "blind." In such cases the vein fissure terminates before reaching the surface, or, if it did once outcrop, the back of the lode is now covered up by later formed strata, lava flows, wash or slide rocks. Blind lodes occur in all mining camps and are generally discovered accidentally during the prosecution of work in adjoining properties. Often a hint of their presence is given through broken quartz or other mineralized gangue rock found intermingled with the soil. When decomposition is rapid the back of a lode is often worn down and washed away by heavy rains to such an extent as to form a depression or trough, which marks the course of the vein, and this trough in time becomes partially filled in from the sides with debris and sometimes grown over with grass or brush. In other cases the trough becomes the track of a stream, and the stream eventually cuts out a canyon, with the wall rocks bounding it and the vein on either side. The back of the lode will then be in the bed of the stream.

Blind veins may be looked for along the line of displacements (faults) and in association with dykes; in both cases the lode is apt to be covered either by disintegrated dyke material or by loose rock, soil and rubbish of various kinds.

Sumpter, Or., Jan. 26.

Of Interest to Owners of Refractory Ore.

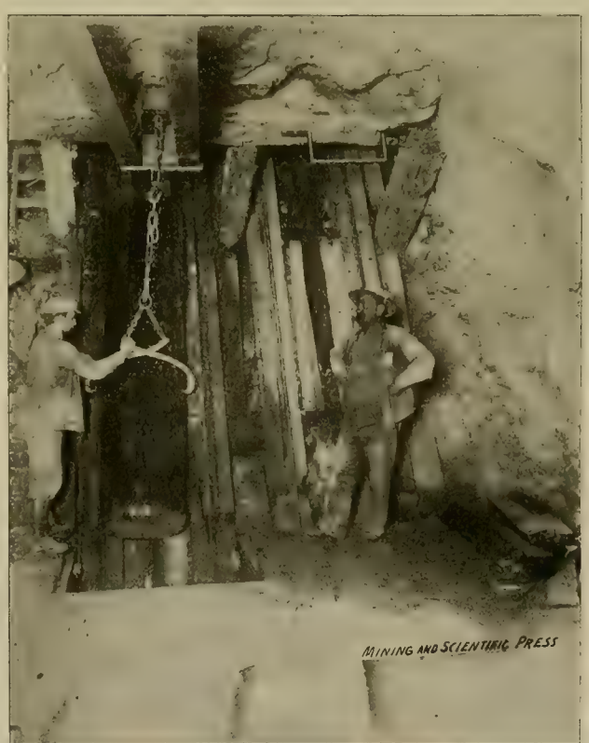
Written for the MINING AND SCIENTIFIC PRESS by S. E. BRETHERTON, Manager Silver City, N. M., Reduction Co.

Several years ago the writer, while in charge of a large lead smelting plant in Leadville, Colo., experimented with the waste heat of slag while it was still in a liquid or fluid state, for the purpose of producing steam, and was surprised at the success he met with, even with the crude arrangement he had in use for making the experiment. He then tried to secure patents for this purpose, but the application was rejected each time on the grounds that he conflicted in some way with other patents, so he let the matter drop. About this time hot blast was being experimented with for smelting sulphide ore, and I was at once favorably impressed with the idea, as it was in line with the great advancement made in iron smelting by the use of hot blast, although the extensive methods adopted by the iron ore smelters are not practicable or necessary in either lead or copper smelting.

The Bimetallic Smelting Co. in Leadville adopted the use of hot blast after Lawrence Austin had demonstrated to them that it could be successfully used—in fact, Mr. Austin deserves the credit of spending much of his time and knowledge in the development of the hot blast idea for the smelting of sulphide ore without the usual expense of fine crushing and roasting. The blast was heated by passing it through return bends of pipe set in a brick furnace heated with wood or coal.

I at once saw that the idea on utilizing the waste heat of slag for steam could be applied to heating blast, and we were granted our first patents for that purpose. This scheme not only saves the expense of fuel for heating the blast, but gives a much more steady heat and is arranged so there is no back pressure on the blowers, which is caused by return bends.

As one improvement leads to another, we then had our slag receiver enclosed and set on jackscrews with wheels, more on the principle of an ordinary large cupeling furnace for concentration lead bullion than a reverberatory roasting furnace.



This style of furnace enabled us to keep the surface of our slag liquid with very little fuel on top, and also use a slag receiver or matte settler, without chilling, several times larger than when not enclosed. Now, when using a deep settler and making very high grade copper matte there is danger of chilling it in the bottom of the settler; this trouble we obviated by passing the balance of the white heat, after it had been utilized for heating the blast, back under the settler and then to the chimney. Should the settler get too hot at either side, an opening is made in the wall so as to allow a cold draft to chill that portion of the settler. A long, deep spout kept full of liquid slag so as to trap the blast connects the blast furnace with the slag receiving furnace, which keeps up a continuous flow of slag and does away with tapping the furnace. This steady flow of slag gives it a much better chance to free itself from matte than an intermittent rush, which is caused by tapping by hand in the usual way, from small furnaces.

Our arrangement and experience here has enabled us to use the same settler for months while making an average of 60% copper matte and making a slag unusually clean. As simple and cheap as this arrangement may seem (costing about one-fourth to one-tenth the price of a roasting furnace), it does away with roasting entirely and utilizes the sulphur as fuel in the blast furnace, at the same time combining in the arrangement an improved method of cleaning the slag. It has been in successful and continuous operation for one year at Silver City, N. M., costing very little for repairs and reverses, the general order of smelting making sulphide ore now more desirable than oxidized ore, not only of requiring less fuel, but a much higher percentage of the values are saved and the smelting capacity of the furnace increased. There are three patents to protect the owners, but the right to use all three can be secured on reasonable terms.

It is optional with the parties using the arrangement whether they have the blast pass directly from the blower into the heating box on its way to the blast furnace or pass it en route through an air jacket above the feed floor around the smokestack. This air jacket warms the blast and keeps the feed floor cool.

Handling Timbers—1600-Foot Level Rawhide Mine, Tuolumne County, Cal.

Handling Timbers—1700-Foot Level Rawhide Mine, Tuolumne County, Cal.

Method of Handling Timbers.

Written for the MINING AND SCIENTIFIC PRESS.

A system of handling timbers at the Rawhide mine, Tuolumne county, Cal., has labor-saving features deemed worthy of illustration and description. The method was devised and put in practise by Chas. Jacobs, the mine foreman, whose practical intelligence has been of service to his company. The accompanying illustrations, taken at two underground stations, show the principal parts of the device. It will be seen that a heavy timber has been let down the shaft or incline, attached to the bottom part of the skip. It is fastened thereto by a specially constructed chain, fitted at the end with dogs, which are driven into the timber, as is done at logging camps. When the timber arrives at a station in the mine where it is to be unloaded, a workman seizes it with a pair of strong clamps, similar to an iceman's tongs, the chain fastening the timber to the skip is then unhooked, and the timber is run free of the skip and away from the shaft by means of a trolley track fastened to the roof of the station. Being thus suspended by a chain 4 or 5 feet long, the single workman who fastened the hooks into the timber can easily swing the log upon a truck, and it is then ready to be wheeled into the drift where needed. This is the process in case of heavy timbers, where the skip is obliged to stop at the station. In case of small timbers, which are sent down inside the skip, a practised workman can fasten the hooks into the timber while it is in motion and draw it out without checking the descent of the skip. Not only are heavy timbers sent down the mine in the method first described, but a number of smaller poles can be fastened together by chains and the entire bundle handled in a manner similar to that adopted with large timbers. An essential part of Mr. Jacobs' device is the trolley fastened to the roof of the station. This is similar to the trolley that is frequently built over large saw-tables. Another feature is the construction of the hook by which the chain is fastened to the skip. It is a pointed affair, the two parts of which fold up to each other and are held in place by a ring, which slips down and clamps them together. The ring is easily slipped up and the two parts unfold, thus releasing the chain. But one man is necessary at a station to handle the heaviest timbers, instead of three or four men, as in some mines. The labor-saving element of this device is apparent here, as well as in the time-saving that is effected. The whole invention is simple, but of such practical advantage that it is deemed worthy the attention of all mine foremen who are on the lookout for improvements.

Tunneling Record at DeLamar, Idaho.

Written for the MINING AND SCIENTIFIC PRESS by D. B. HUNTLEY, Manager at the Mines.

As the result of a friendly wager between rival mining companies in this county a tunnel lately run at DeLamar, Owyhee county, Idaho, by the DeLamar Mining Co., Ltd., made an excellent record. The conditions and costs are given below:

An old, small tunnel had formerly been driven 160 feet. Work was re-commenced upon it July 5th, '99, and by September 1st, '99, without any rushing, it had been straightened, enlarged, grade taken up, and driven to a total length of 250 feet. Then work under the wager commenced. During the preceding two months a Rand steam-driven 14x22-inch cylinder class C compressor, and a 14-inch Buffalo exhaust fan had been placed, air and water pipe, track rail, cars, drills, etc., secured. The compressor was situated in the mill building about 500 feet from the mouth of the tunnel. Thus, on September 1st, all was ready for work, which was pushed with the utmost vigor until January 1st, 1900. There were only two days lost time (September 4th, which was Labor Day, and Christmas), making the total time of operation 120 days. The monthly progress was as follows: September, 279 feet; October, 389 feet, and 6 feet in a powder-thawing crosscut; November, 402 feet; December, 436 feet; total progress in the 120 days, 1512 feet; total length of tunnel January 1st, 1756 feet. Average daily progress for the entire 120 days, $12\frac{6}{10}$ feet. Average daily progress for thirty days in December, $14\frac{5}{10}$ feet,

The best three separate week's records were: 107 feet, 110½ feet and 120½ feet. The poorest separate three week's records were: 25½ feet, 60 feet and 78 feet.

The tunnel was comparatively dry, only a few water seams being encountered. Only four or five sets of timbers were required. The size of the tunnel is 7½ feet high by 7 feet wide, with single 18-inch track, and a ditch 12 inches deep by 18 inches wide beside the track. Over this ditch is a walkway 2 feet wide, of 2-inch plank. The track is of 12-pound T rail, with 4x4-inch stringers. The ventilation was perfect through a 12-inch diameter No. 22 galvanized-iron pipe. Twenty minutes after blasting the men were able to commence work. In general, fuse and caps were used. Firing with a battery was tried and abandoned.

The formation was a black, compact lava or basalt and at times it was massive, exceedingly hard, short, tough ground. Once one round of holes required thirty hours for drilling. At other times the ground was a compact, brecciated basalt, much softer, but still firm blasting ground and requiring no timber.

The working force consisted at first of twenty-five men, in eight-hour shifts. There were twelve drillmen, six shovelers, three carmen and mule drivers, one boss who was also pipeman and trackman, one ditchman who also drilled holes for the pipe supporting eyebolts, and one blacksmith with helper. During the last six weeks of the time, finding that the two drills could make more than a round in eight hours, four drillmen were added to the force, making twenty-nine men in all and making drillmen's shifts of six hours. A round was nine to fourteen holes (usually eleven), depending on the ground, and the depth was 4½ feet. The engineers of the compressor were not counted, as they regularly ran the mill engine and incidentally attended to the compressor and exhaust fan.

The machine men were required to shovel back the broken ground far enough to secure a firm support for the drill column, which was vertical and carried two column arms, one for each drill. The stock of machine drills consisted of three old Little Giant No. 2 Rand drills and three new Slugger No. 33 Rand drills, the latter being used for the harder ground. At times, when the hard bands were encountered, four machines were in the repair shop. About twenty-one hours in all were lost, due to broken machine drill parts.

The powder used was Hercules No. 2. In drilling down holes, water was used from a 2-inch pipe and under a pressure of 75 feet, to wash out the clay and sediment. The men employed were Cornish miners, with few exceptions. Mules were used to haul six to ten ¾-ton cars per trip to the surface, after the tunnel had advanced 500 feet.

The prices paid are as follows: Labor, $3 and $3.50 per day; lumber, $33 per 1000 feet; mining timbers, 15 cents per running foot; freight from San Francisco or Chicago, 3 to 4 cents per pound.

The compressor was not run by separate boiler, but from the mill boilers, and was estimated to require two and a half cords of poor wood per day, costing $9 per cord.

The entire work was under the personal supervision of Thomas Davy, the foreman of these mines, and to him principally is due the credit for the rapid progress. Harry Goad was the single shift boss and S. Gundry the blacksmith.

The costs for the four months for the 1512 feet were as follows:

	Per Running Foot.	Total.
Labor (general superintendence not included)	$ 7 11	$10,751 17
Powder, fuse and caps	1 18	1,785 95
Fuel	1 48	2,237 75
Track, air and water pipe	1 04	1,566 75
Drill fittings	24	363 02
Freight on material	65	981 38
Sundries	65	993 71
Totals	$12 35	$18,679 73

PRODUCERS AND CONSUMERS of gas will alike be interested in the alleged new discovery of W. H. Cone, of Ottawa, Canada, of a new method of generating water gas for lighting and heating. An apparatus has been installed in Ottawa for making the gas by this new method, wherein hydrogen is generated by the decomposition of water by electricity and made to permeate coal oil or any heavy carbon oil. In this way the hydrogen becomes carbonated, and when mixed with air makes an illuminating gas which Mr. Cone says can be produced at 40 cents per 1000 feet. The process is his secret. "Secrets" now-a-days are doubtful in science or mechanics, but Mr. Cone is forming a company with a capital stock of $100,000, to operate the system. He is a chemist, and says he stumbled upon this new method of generating the water gas while he was endeavoring to find a means of generating oxygen for medicinal purposes.

AT present the largest use of aluminum is for electrical conductors, next coming its employment as a deoxidizing agent in steel making, then as a material for bottle and jar caps, and next for the manufacture of "advertising novelties."—Electrical Review.

Improvement in Clip for Wire Ropeway.

Evolution and progress characterize every device and apparatus connected with the mining industry. The wire ropeway, now becoming so generally known and appreciated, affords example of this. A late improvement in this regard is noted in the Hallidie ropeway, manufactured by the California Wire Works, 9 Fremont St., San Francisco. Till recently the strap clip (Fig. 1), patented Feb. 12th, '92, was

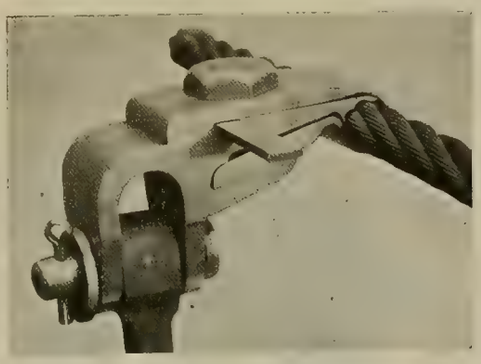


Fig. 1.—Strap Clip.

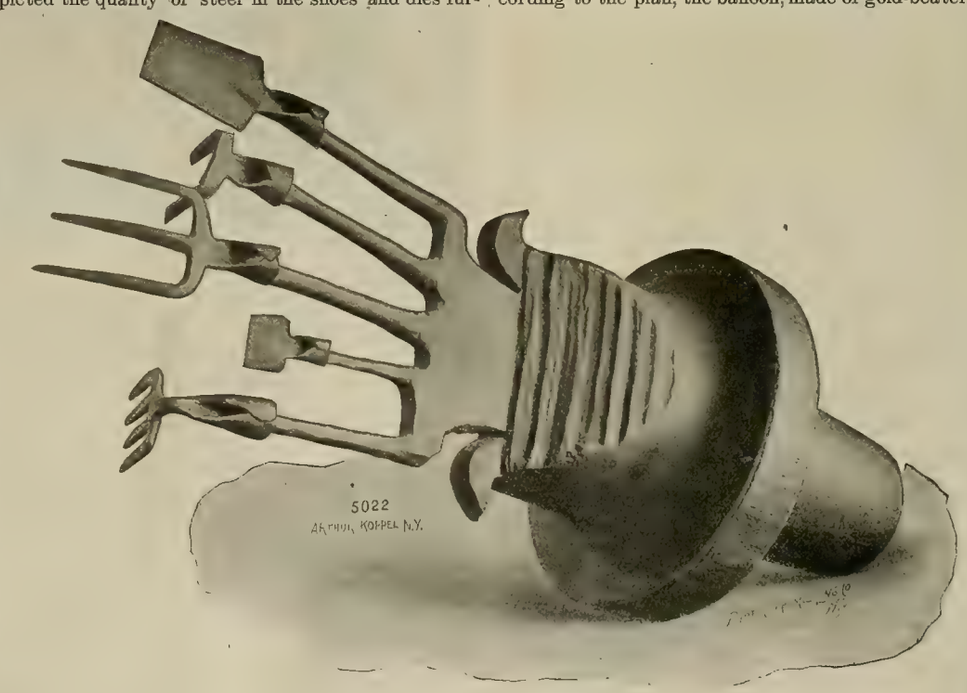
Fig. 2.—Center Clip.



used; this steel clip was in five parts—shank, leaf, key, bolt and nut—the leaf or strap encircling the rope and with the other devices holding the shank in place. A newer device, patented by A. S. Hallidie last May, simplifies the arrangement, permitting easier passage on the rope, the station sheave and horizontal end pulleys. This latter clip is illustrated in Fig. 2. Tests indicate an ability to sustain 2500 pounds without being strained or pulled out of place.

Novel Test of Stamp Shoe and Die.

In the accompanying illustration is graphically depicted the quality of steel in the shoes and dies furnished by Arthur Koppel, 66 Broad St., New York City.

The shoe and die from which were fashioned the fork and other implements was used in a battery in the mill of the Village Main Reef Gold Mining Company, in the Witwatersrand district of the Transvaal, South Africa, where the stamps pounding on the ordinary banket ore of that region weigh each 1200 pounds. During four months in '99, from May to August, there was a special test of shoes and dies in the mill mentioned, the Koppel shoes running 108 days, and the dies 120 days, the average wear per shoe for sixty days being 5.48 inches for the Koppel shoe.

After the 1200-pound stamp had pounded on the Koppel shoe and die for the time mentioned, the worn piece of steel was given to a smith, who forged from it the implement shown in the engraving, showing how fine the grade of steel that made it possible to so work an old piece of Koppel steel after such hard usage, thus demonstrating its toughness and resilience.

A Novel Test of Shoe and Die Steel.

Regulations with Regard to Pig Lead Made from Canadian Bullion.

The following memorandum has been issued by the Customs Department of Canada: It is ordered that pig lead, when refined outside of Canada from lead bullion which has been produced from Canadian silver-lead ores smelted in Canada, shall be admitted into Canada, until otherwise provided, upon payment of duty on the cost of refining the pig lead, as determined by the Minister of Customs, subject to the following regulations, viz.:

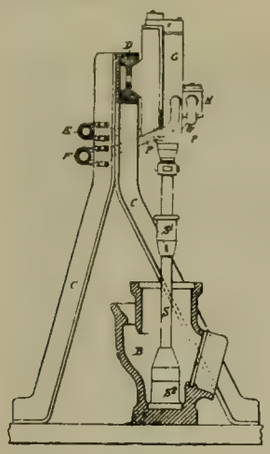
1. The lead bullion shall be exported under customs' supervision at the expense of the exporter and consigned direct to the refinery. The export entry, made in quadruplicate and attested before the Collector of Customs, shall be certified by a customs' officer after verifying the quantity shipped for exportation. The collector of the port where the export entry is made shall retain one copy of each entry on file in his office, and shall forward one copy each (a) to the Canadian frontier port of exit; (b) to the Department of Customs, Ottawa; (c) to the refinery.

2. Pig lead refined from Canadian silver-lead bullion, smelted and exported as aforesaid, may be entered at the port of Montreal or other port designated by the Minister of Customs, upon payment of duty upon the cost of the refining thereof, as determined by the said Minister, provided that there shall be produced with the importer's bill of entry, and annexed thereto, a copy of the Canadian export entry of the bullion and the invoice from the refiner, duly attested before a notary public in the form prescribed by the Minister of Customs, showing the product of such bullion and other particulars.

3. The invoice for customs entry of pig lead refined from Canadian smelted silver-lead ores may be made in the form in schedule "A," and the import entry may be made on the usual form, under the following descriptions: "Pig lead refined from Canadian smelted silver-lead ores at cost of refining."

A copy of the invoice is to be attached to the import entry forwarded by the collector to the Customs Department.

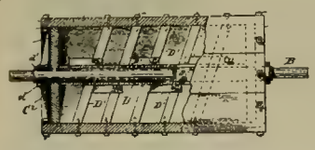
AN electric balloon for night signaling is among the latest ideas, especially for use in the Boer war. According to the plan, the balloon, made of gold-beaters' skins, carries a number of electric lamps, which are connected by wire with an apparatus below. These lamps are flashed at intervals corresponding to the



dots and dashes of the Morse code, and on a clear night can be seen 100 miles away. The balloon may be sent up some distance from an army, connection with the ground apparatus being made by wire. The chance of the balloon being hit by sharpshooters is small, as it is sent up at night, and unlighted, so that when the signals are begun it is out of range. A number have been sent out to South Africa to be tested.—Electricity.

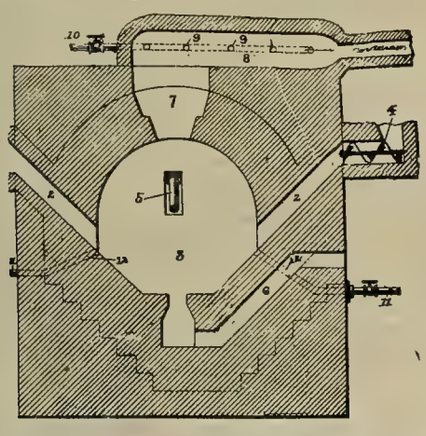
Latest Mining and Metallurgical Patents.

Patents Issued Jan. 30, 1900.



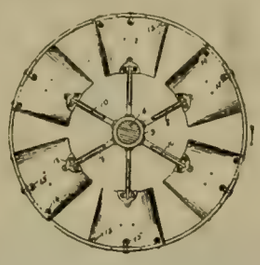
Specially Reported for the MINING AND SCIENTIFIC PRESS.

STAMP FOR CRUSHING ORES.—No. 642,152; F. A. Parnell, London, England.



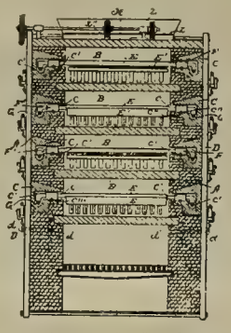
In stamps for crushing ore and the like, combination with shoe and base A, of frame C rising from base, consisting of inclined braces connected together at top, diverging at bottom, respectively connected to base at front and rear; cross-beam D carried by upper side of frames at one side of vertical axis of die, cylinder G carried by cross-beam, piston L in cylinder, connected to shoe for reciprocating it, and means for revolving piston.

AMALGAMATOR.—No. 642,202; J. L. Bradbury, San Francisco, Cal.



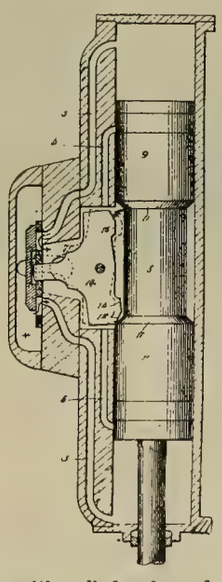
In an amalgamator for treatment of pulp, slime or tailings, the combination with closed receiver or vessel for material to be treated polygonal in cross-section, of feed opening therein, cover for opening, drive shaft extending through receiver or vessel, and to which same is secured, means for imparting rotary motion to the shaft so as to rotate the receiver or vessel, a covering for that portion of shaft within receiver or vessel, a series of breaking arms arranged therein so as to rotate with the shaft and receiver or vessel, arranged at an angle to each other, end plates secured to receiver or vessel outside of its heads or ends, each plate being formed with a bearing hub within which the drive shaft is secured, and of an outlet for the treated material.

PROCESS OF MAKING SULPHURIC ACID.—No. 642,390; F. P. Van Denbergh, Buffalo, N. Y.



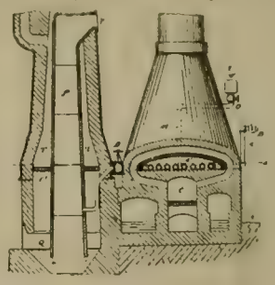
Manufacturing sulphuric acid free from arsenic, nitrogen oxides and other common impurities, subjecting calcium sulphate or gypsum and a flux to heat and electrolysis, both produced by an electric current within a furnace chamber containing the materials and applied directly to and through them while in a molten condition in the presence of an excess of oxygen, thereby forming sulphur oxides, and subsequently hydrating these oxides.

APPARATUS FOR VENTILATING MINES.—No. 642,234; C. P. Kenyon, Scranton, Pa.



A fanwheel with fans or blades 7 provided with notches 12 at their outer ends, and ring 20 encircling fans and extending through notches, the ring being adapted to hold the fans at their proper relative distances and also in their proper plane; in combination with bolts or rods 13 extending from ring to corners of fans, bolts being curved and provided with long threads and adjusting nuts to draw the blades into twisted positions.

ORE ROASTING AND DESULPHURIZING FURNACE.—No. 642,334; A. C. Johnson, Baltimore, Md.



In an ore roasting and desulphurizing furnace, longitudinal side beams with slots or pockets containing endless chains or cables adapted to be reciprocated in and extending to and supported on outside of furnace, posts or buckstays ranged along exterior sides of furnace, idlers on posts or buckstays, reciprocating rakes connected to the chains or cables, and buckstays or posts at one end of frame provided with slots or loops formed as continuation of slots or pockets in beams, and means for reciprocating chains.

ROCK DRILL.—No. 642,463; H. Koch, North Tarrytown, N. Y.

A rock drill, with cylinder formed with chamber therein, communicating directly with interior of cylinder and with atmosphere, a steam chest attached to cylinder, communicating with chamber therein, drill having feed ports passing from steam chest respectively to ends of cylinder, and drill also having exhaust ports passing from chamber in cylinder respectively at points intermediate to ends of cylinder and such chamber, a valve mounted in steam chest and serving alternately to open feed ports and to connect them with chamber in cylinder, means mounted in chamber for transmitting movement to valve and piston working in cylinder and actuating such means.

PROCESS FOR PRODUCING ALLOYS OF HYDROGEN AND IRON.—No. 642,320; G. W. Gesner, New York, N. Y.

The process of producing a malleable alloy of iron and hydrogen by first puddling the iron, subsequently reducing it to a form presenting a greatly extended surface, heating such iron in the presence of free hydrogen and allowing time for the iron to absorb the hydrogen, subsequently detaching and melting the scale thus produced and again mechanically working such alloy.

Not Considered a Just Ruling.

A decision of the Commissioner of the General Land Office, dated January 23, 1900, addressed to the Register and Receiver of the Los Angeles, Cal., Land Office, is that no hearings against "scrippers" titles will be ordered by the General Land Office at the instance of the mineral claimants, unless the protests filed against the scrip entry show that the land in question is actually producing oil in valuable quantities.

The decision, in part, reads: "December 22, 1899, James W. McDonald, Los Angeles, Cal., filed in this office a protest and petition for a hearing. The protest alleges the location of the La Mililla mining claim in conflict with the above selection. The affiants claim to have thoroughly prospected the land and find that it is mineral land, containing great deposits of petroleum; 'that a vein of petroleum running all through the said land is most clearly and unequivocally defined. There is so much petroleum therein contained that the same has forced its way to the surface, and the superficial earth is so completely saturated with petroleum that it burns when the light is applied to it. In several parts where there are declivities the oil in a liquid state exudes from the sides of the banks.'

"The protest does not, even with the showing made, present sufficient reasons to warrant this office in allowing an order for a hearing. The date of the mineral locations is not shown, but there is lacking the essential consideration in all this class of cases: specific evidence of the development of the land for its mineral product and the production therefrom in quantities and qualities sufficient to indicate that the land is more valuable for mineral than for agricultural purposes. In the absence of this a hearing should not be ordered."

New Steam Drier.

An apparatus for depriving steam of surplus moisture on the way from the boiler to the cylinder has been invented by M. E. Leppik of Warsaw. It depends for its action upon centrifugal force. The steam passes through a turbine fixed in a drum in which centrifugal tendency causes the particles of water to become separated from the steam and to descend through a tube into a boiler, the dry steam passing through another tube to the engine. The steam pressure, being less than the pressure within the boiler, causes the steam to flow through the turbine into the drum, and passing through the turbine channels in a tangential direction towards the circumference of the drum, the centrifugal force takes effect on the particles of steam. This force produces a tendency in the water to describe large circles, thus collecting on the walls of the cylinder, while the steam, being lighter, acquires a rotating motion in the middle part of the drum and in a dry state passes to the engine.

A PAPER published in a mining district has an invitation to the public to come and inspect the resources of the section. It says: "All the intending investor need do is to signify what kind of mines he is looking for, and they will be shown him." This is certainly a convenient state of affairs, in view of the difficulties experienced elsewhere in the search for mines. Such reckless statements can do no district any good.

AT Wrightsville, Pa., it is proposed to spend $5,000,000 on a dam and dynamo outfit, to utilize the water power of the Susquehanna river in furnishing electric light and power.

IN the California Legislature this week the mining law of '97 was repealed.

Notes on Handling Dynamite.

Written by W. R. QUINAN, Superintendent California Powder Works.

Dynamite should be stored in a cool, dry place. Nitro-glycerine is a liquid with a high boiling point, but it evaporates sensibly at temperatures a little above the normal. At a temperature of, say, 100° Fahr., the loss is serious in proportion to the time of exposure. In this way the powder may be much weakened. In a damp place it will absorb moisture, and if it is stored for any length of time it will be spoiled.

THAWING.—Probably two-thirds of the fatal accidents that have happened with dynamite have come from careless methods of thawing. Dynamite freezes at about 45° Fahr. In this condition it is stiff and hard, and should not be used for blasting, as it is insensitive to the ordinary detonator. The powder is a poor conductor of heat, and for this reason it freezes and thaws slowly. The time required to thaw it thoroughly when it is once solidly frozen is much greater than most people think. Shut in the boxes in a magazine, it will remain frozen even in summer for many weeks.

The thawing of dynamite is always attended with danger if it is done rapidly at a high temperature. The danger is in direct proportion to the temperature. No matter how urgent the haste may be, the temperature used should never exceed 100° Fahr. A dry heat should be used—that is, the powder should not be brought in direct contact with hot water or steam. Water tends to make the nitro-glycerine exude, and also attacks the chemical salts in the composition. Where the object justifies the expense, it is a good plan to keep the exterior of the magazine at a moderate temperature—say 60°—which will prevent the powder from freezing.

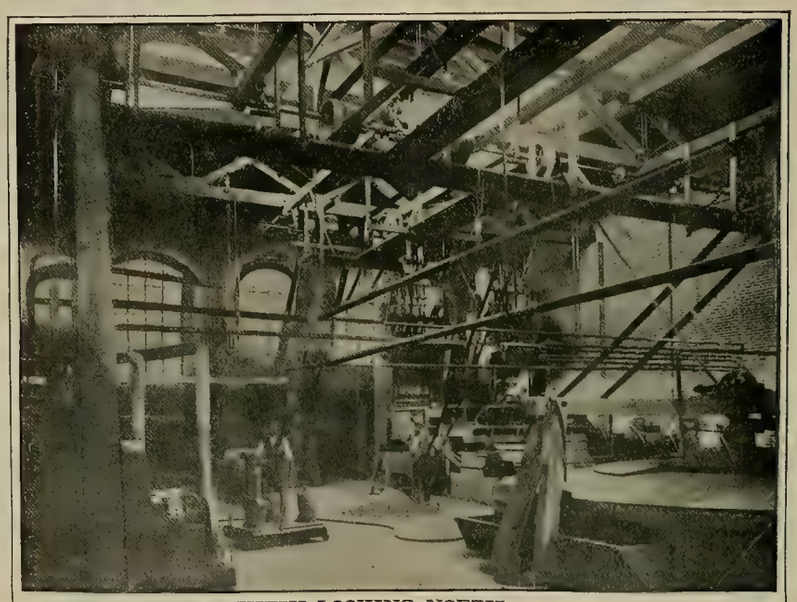
Steam pipes should never be used inside of a building where powder is stored. The best method of heating is the well known hot-water system used for dwellings. In this the circulation is active, and the arrangement such that the water cannot be brought to the steaming point, or even overheated. It has been found that a maximum temperature of 104° in the water gives an active circulation. The heater is located at a safe distance, and the water circulates through the pipes in the building and returns to the heater. The pipes outside the building are well protected and covered to prevent loss of heat, and the building should be made as impervious to heat as possible.

Double walls, floors, and ceiling with a sawdust filling answer every purpose, but the building must be made absolutely tight. A crack under a door or window will counteract the best heating system that can be made.

If steam is available, a very cheap and efficient system of heating a small building is as follows: On the outside of the building a sheet-iron drum is set up and connected with another inside. Two pipes pass through the wall connecting the drums near the top and bottom. The outside drum is set a little lower than the other to provide for the overflow of the water. The holes through the walls are packed around the pipes with waste or tow. Water in the outside drum is heated by a small steam pipe, and circulates through the drums. The room is kept warm by the radiation from the inside drum. If the building is tight and properly insulated, the amount of steam necessary is very small. To prevent the vapor from making the room damp the drums are closed on top with wooden lids covered on the under side with cloth soaked in paraffine. The sheet-iron drum used for the transportation of glycerine or coal oil is well suited to this work.

When dynamite is being used in winter on a large scale, as at a mine, it would pay to build a small thawing room of this kind—say 12 by 16 feet. The powder used for the day's consumption could be carried in and left for twelve hours or more, the boxes being simply opened or the powder taken out and put on shelves, depending upon the time available. A temperature of 75° or 80° maintained during the night would suffice to thaw the powder. A thermometer should always be consulted to regulate the temperature of the room, which should not exceed 85°.

This particular arrangement for a thawing room is convenient, but it may be varied to suit the case. The essential feature is a tight, heat-insulated room, kept at a moderate and regulated temperature.



The plan of a thawing room is much better than using thawing stoves. The best of these are liable to get out of order, if not originally dangerous. The thawing room has great capacity, so that the work need not be done in a hurry, and has always this advantage over a small apparatus: Any excess of temperature brings discomfort to the operator, and so gives warning. A room in which a man can work without distress is safe for thawing dynamite.

In no case should any apparatus for thawing powder be used in a magazine or building where a large quantity of powder is stored. The same warning applies to the handling of caps in the preparation of primers.

CHARGING.—In charging a drill hole use a wooden tamping rod. If the hole is dry, cut the cartridges into short lengths and slit them along the sides, so that when driven down with the rod the powder will spread and fill the inequalities of the hole. The primer, with the cap carefully attached, should be put in last—that is, on the top of the charge. The hole is then to be filled and tamped with care. Earth or clay mixed with gravel makes one of the best tampings. In a wet hole leave the cartridge intact for the better protection of the powder.

St. Louis Sampling and Testing Works.

These works were built to afford an opportunity of testing and treating ores, on a working scale, so as to determine their value and the best and cheapest practical method for their reduction. In the design and construction of the works no time nor expense was spared to make a model plant, supplied with every requisite. The works are on Spruce street, one square from Union Depot. The building is of brick, with a frontage of 60 feet on Spruce street and a depth of 139 feet. A clear span truss roof covers

VIEW LOOKING NORTH.

VIEW LOOKING SOUTH

the whole so that the floor space is not interfered with by posts or columns. The floor of the mill, except near the furnaces, is laid with granitoid flagging, which has a smooth, hard surface easily kept clean, facilitating the attainment of accurate results. The water supply is from the city main, with a 6-inch connection.

The accompanying views will give some idea of the character and scope of the plant. The sampling plant consists of rock breaker 10x4, weight two tons; belt rolls, 10x16, weight 3500 pounds; and sample grinder, with ample floor space for handling several lots at a time. The gold mill has an automatic ore feeder; a 3-stamp battery, with 650-pound stamps; electro-plated copper plate, 30 inches by 8 feet; blanket tables, etc.; full size vanner and table for concentrating the tailings; reverberatory furnace, capable of taking a 900-pound charge of average ore, for roasting sulphuret ores; chlorine generator and tanks for treatment by chlorination; and two 3-foot iron pans for amalgamation. The silver mill has an automatic ore feeder; a 5-stamp battery, 650-pound stamps, total weight ten tons; full set of screens of different sizes; settling tanks; two 3-foot iron amalgamation pans, weight 3500 pounds; one 6-foot settler, weight 3400 pounds; tailing tanks; reverberatory roasting furnace with dust chambers and 8′x8′ hearth for roasting or chloridizing ores; a full set of tanks arranged with ample fall, giving facilities for working ores by leaching or wet method. For crushing by rolls the works have a rock breaker, two pair belt rolls, 10x16 inches, elevator and screen trommel. Retort and melting furnaces complete the silver plant.

The concentration plant embraces rock breaker, stamp battery, two pairs belt rolls for crushing; a 31-foot cup elevator; four revolving sizing screens, each 36 inches by 5 feet; three crank-motion, double-compartment jigs, each 3x6 feet, with tray 20x32 inches; three eccentric-motion, double-compartment jigs, each 3x6 feet, with trays 20x32 inches, jigs provided with cone pulleys for changing the speed; a 15-foot hydraulic separator; a spitzkasten, or pointed box, 15 feet long, with four compartments for slime classification; revolving table, 20 feet in diameter; vanner, 4x12 feet; hand jigs and riddles for smaller tests, the whole forming a complete ore-dressing establishment of unusually large capacity.

The plant for testing fuels includes:

(a) Complete machinery for the washing of impure coals and coal slack, viz., two pairs of belt rolls, 10x16; cup elevator; four trommel sizing screens, each 36″x60″; six plunger jigs (three with crank and three with eccentric motion), each with trays 20″x32″; classifiers and slime machines.

(b) A coking oven 2½x4½x6 feet, provided with side wall and bottom flues, and so arranged that it can be used as a plain oven of the Welsh type or on the Belgian system, affording facilities for thoroughly testing the coking properties of coal upon a full working scale.

(c) A 54″x16′ return flue steel boiler, thirty-six 4-inch flues, provided with all appliances for making complete fuel trials, including arrangements for taking samples of stack gases for analysis.

The fullest provision is made for sampling ores, all classes of mineral substances and metallurgical products. All kinds of engine, boiler and furnace tests are undertaken, as well as measurements of power transmitted through engines or shafting, tests of steam and other pressure gauges, electrical apparatus, etc.

MINING SUMMARY.

ALASKA.

G. C. Hazlett of Omaha, Neb., has shipped for the Chisna River M. & I. Co., for working placer districts on Chisna river, which empties into the Copper river near Valdes, a $20,000 plant.

CAPE NOME.

Report to the State Department, dated December 8, from Reynold Morrison, Vice-Consul at Dawson City, is that many people are making preparation to get to Cape Nome from Skaguay, via Dawson, over the ice, a journey of 2600 miles. He says if all who are contemplating it make the trip this winter, there will be one continuous line of people from Bennett to St. Michael. The transportation companies have already arranged to handle 3000 passengers. The route to Cape Nome, via Dawson, is said to be four weeks earlier than the all-sea route, because of the open water along the shore north of the Yukon river. The weather at Dawson was reported as comparatively mild, from 15° above zero to 18° below. The mildness has interfered with mining by flooding the drifts, and the gold output will fall short of the estimate of $25,000,000.

ARIZONA.

COCHISE COUNTY.

Tombstone reports that A. L. Grow of that place, representing New York men, has an option on eighty claims, old silver producers of that camp, and contemplates draining them.

PIMA COUNTY.

Citizen: Mexican miners at the Ray mine have worked ten-hour shifts for $2. Recently, that all might work during a quiet time, they have received $2 pay for eight hours work. Being required to resume the old schedule of ten hours, the entire gang decided to strike and now demand $3 per shift for eight hours. They declare they have provisions for two months and will not allow other miners to work in the mine. They were all formally discharged by the company. The probability is that the mine will stay shut down until the railroad from Ray to Calvin is completed and the new 200-ton concentrating plant at the latter place is ready to operate.

Oasis: The Temporal M. Co., H. Barnett, Mgr., is developing mining property in the Wrightson district, seven miles west of Crittenden in the Santa Cruz mountains. They are down 112 feet on the Acme mine, with 60 feet of drifts in the bottom of the shaft. The ledge is 4 feet wide with a pay streak varying from 12 to 18 inches in width. Ore extracted runs 50% lead and forty to seventy ounces in silver.

YAVAPAI COUNTY.

(Special Correspondence).—The town of Congress, where the celebrated gold mine of that name is situated, lies about three miles north of Congress Junction, a station on the line of the Santa Fe, Prescott & Phœnix railroad, and contains a population of 1200. This famous gold mine was discovered a good many years ago by D. May, an old prospector, who developed it to some extent, and in 1887 sold it to "Diamond Joe" Reynolds for $60,000. In 1889 Reynolds put up a 20-stamp mill on the property, which ran for sixteen months, when twenty more stamps were added. This was before the advent of the railroad, and everything had to be freighted to Prescott at a cost of $17 per ton. In 1891 the railroad was projected, and "Diamond Joe" concluded to wait until it came. Up to this time it had produced $750,000. While it was shut down the present owners, known as the Congress Gold Co. and composed of Messrs. E. B. Gage, F. Murphy, N. K. Fairbanks and some Eastern people, purchased it at $1,000,000, at which figure it is capitalized. It was started up in March, 1894, since which time it has been running to its fullest capacity day and night. The mill has a capacity of 100 to 110 tons of ore per day, which will average $20 per ton in gold, and the cyanide plant, which is working on the tailings, considered to be the most complete of its kind in the Territory, reduces 110 tons of tailings which average $6.50.

There is no free gold in the ore, the values being found in a white quartz filled with pyrite. This is one of the deepest mines in the Territory, the deepest incline being 2700 feet in depth and it is said that at the bottom of this shaft there is no change in the character, value or size of the ore body. There are five steam hoists on the property, and the gross output approximates $1,000,000 a year. The property consists of twenty-five claims and there are between twelve and thirteen miles of workings underground. There is reported to be ore enough in sight to last for years. There are 350 miners employed. W. F. Staunton, formerly of Tombstone, is the Supt. in charge.

At the base of the same range of mountains in which the Congress mine is situated and five miles east of Congress Junction is Fool's gulch, where mining has been going on for nearly thirty years. A small force of men is at work at present and a 10-stamp mill reduces the ore, although not running full time. Stanton, also in the same range, is nine miles east of Congress Junction, and is an old mining camp. Three miles beyond Stanton is Weaver, one of the oldest gold mining camps in the Territory, gold having been found on Rich hill in 1862, at which time several hundred thousand dollars were found in nuggets of various sizes. Quartz ledges were afterward discovered and a 10-stamp mill erected, the tailings from which are now being worked by a small cyanide plant, which has thus far reduced 3000 tons running from $5 to $10 per ton. This camp is taking on new life and promises to rival Congress. The Octave G. M. Co., composed of Pennsylvanians, has bought twenty-five claims (four of which, the Johnson, Peterson, Leviathan and Rumor, have been producers) for $80,000, and 200 men are developing the old workings, in one of which a 3-foot ore body carrying $25 per ton in gold has been opened up. The foundations for a 40-stamp mill are being completed and the mill will be in running order by the first of June. A town of tents has already sprung up and the company has several handsome frame buildings of California redwood nearing a state of completion. D. J. Jones is Supt. of this property.

Congress, Feb. 3.

The Jerome M. & S. Co. has capitalized at $1,500,000; secretary, T. H. Brown; manager, Doane Merrill. The mines are located in the Black Hills district.

YUMA COUNTY.

(Special Correspondence).—West of Congress Junction sixty-five miles lie the Hacuvar mountains and the Harqua Hala district, where the old Cunningham mine is situated, from which in the early days ore was shipped down the Colorado river, through the Gulf of California to Swansea, Wales. Well-known writers on mineralogy declare this to be a rich mineral belt. The formation is granite with dykes of porphyritic shale. The veins lie in a contract between granite and diorite. Messrs. Kelly and Bullard have relocated the Cunningham mine, cleaned out the old shafts and put down three new ones, finding at water level ore running $125 per ton in gold and copper. O. L. Gear and associates, Eastern men, have located thirty-five claims in this mineral belt. The deepest shaft in the district is 230 feet and was sunk by Mr. Burson of Phœnix and his Denver associates, who have a body of sulphides.

Harqua Hala, Feb. 1.

Prospect: The shaft on the Fortuna mine is down 900 feet; ore body unchanged. A 20-stamp mill is in operation and a cyanide plant takes care of the tailings.

CALIFORNIA.

CALAVERAS COUNTY.

(Special Correspondence).—Angels is the center of much mining interest, not only because are located here some of the largest active properties in Calaveras county, but because the routes of travel for the southern part of the county converge here, and mining people congregate at the hotels.

The dominant enterprise of the town is the Utica M. Co. With the original Utica mine as a nucleus, the company has extended its holdings until now it owns much of the mineral land within the town site and immediate vicinity. It is extending its underground operations beneath the homes of the people, but by agreement with lot owners is presumed not to come nearer than 500 feet from the surface. It has three shafts, within a stone's throw of each other, in the heart of town, viz., the Utica, the Stickles and the Cross. Clustered about the Utica hoist and mill are the structures which accommodate the various departments of the business—sawmill, machine shop, storehouses, office buildings, etc.

Ore from the Utica shaft is crushed in the 60-stamp mill located close to the hoist. The sulphurets from this mill are conveyed in buckets by a wire rope tramway to the sulphuret works of the company, on the east bank of Angels creek, one-fourth of a mile distant. On the side and crest of an intervening hill are the Stickles and Cross shafts, which send their ore to the 60-stamp Stickles mill, on the west bank of the same creek. Besides the three shafts above mentioned, the Utica Co. controls or owns the Gold Cliff mine and mill, half a mile north of its other properties. The Gold Cliff hoist is in an open cut from which the ore was removed in former years. There is here a fine illustration of the great width of the main vein of the mother lode, as the cut accommodates the hoist with its necessary machinery without crowding. Within recent years a shaft 400 feet deep has been sunk at the Gold Cliff. The walls here are almost vertical, necessitating little timbering. The ore is hauled to the old Madison 40-stamp mill, on the north bank of Angels creek. Near the Gold Cliff mill is a blanket plant for the mills above, from which the sulphurets are hauled by wagon to the cyanide plant. The Utica Co. has an extensive water and electric system of its own, and, besides securing its power and light from this source, is in the market to sell power to other enterprises, being an active competitor in this line. It supplies electric lights to the towns of Angels and San Andreas. Its principal power plant is at Murphys, with sub-stations at Angels, San Andreas, etc. The Utica is an extensive enterprise in many ways, and its activities and developments have contributed to the prosperity and prospects of southern Calaveras county. L. W. Shinn is general superintendent for the company, W. J. Loring is superintendent of mills, and W. B. Miller general mine foreman. It gives employment at Angels to nearly 600 workmen.

The Lightner mine is the nearest active neighbor to the Utica, joining that property on the north. A recent accident at the Lightner was caused by a breaking through of the walls between the Lightner and some old workings at the Utica. The shaft at the Lightner is down 500 feet. The hoist is run by steam, but the mill and air compressor get their motive power from electricity supplied by the Standard Electric Co. There are forty stamps and twenty concentrators in the mill. The sulphurets are sent to the Utica Co.'s works. H. F. Whirlow is superintendent of the Lightner, Owen Owen foreman. One hundred men are employed. The owners of this property are mainly Stockton people.

The next mine on the north, joining the Lightner, is the Angels (or Fox) mine, owned by J. V. Coleman. The ore from this mine has been worked at the old Baumhogger 10-stamp mill (leased for the purpose). Mr. Coleman will build a 20-stamp mill near the hoist, to be run by electric power. The equipment consists of a double steam hoist (40 H. P.), capable of sinking 600 feet. Present workings are to a depth of 300 feet. A vertical air compressor is also operated. About forty men will be employed at the Angels after completion of the new mill. A. S. Buckbee is superintendent of the property.

The properties above mentioned, with the exception of the Gold Cliff, are located upon the most eastern of the system of three parallel veins which course through this locality. The Gold Cliff is upon the main or mother lode. Joining the Utica properties on the south, and across Angels creek, are the Drakes Properties, Ltd. At present matters are at a standstill, awaiting developments. South two miles is the Bruner, now known as the St. Lawrence, a consolidation of several claims. Work here has been suspended for a time owing to a scarcity of wood for steam purposes. A. J. Cameron is superintendent in charge. Farther south is the Santa Ana mine, near Carson Hill. Much work in the way of development has been done here, but apparently with indifferent success. The machinery is now idle and the plans of the company are not known. The property is owned mainly by Salt Lake parties, with J. J. Peirano, foreman, in charge.

At Angels the property joining the Gold Cliff on the north, on the main vein, is the Brown, Smyth & Ryland. There are prospects that company matters may be adjusted so that development may begin. The ore taken from the different veins, and especially from the main vein, is of good character. C. D. Smyth is in charge.

The most active of the mines on the west belt is the Libra mine, formerly known as the Blair Con., two miles from Angels. It is milling good ore. Its main ledge has been crosscut for 93 feet without striking the hanging wall; depth attained in the shaft, 500 feet, with 700 feet in drifts, largely at the 400 level. This is the deepest mine on the west belt. The equipment consists of a steam hoist, an air compressor and a 10-stamp mill. The stock of the company is owned principally by New York people, with J. J. Schmadeke, a Californian, in charge as superintendent. Fifteen men are employed.

There are several mining claims in the vicinity of Angels, from most of which good things are expected. Angels will be a lively mining town for years to come.

Your correspondent visited Copperopolis and the adjacent region, being lured to the site of the famous copper property by the reports published broadcast several months ago to the effect that operations at this abandoned camp were about to be resumed and that the streets of the old-time city would again assume an aspect of life and bustle. He was disappointed. To a limited extent, work has been resumed at the Union copper mine, but this work is confined to the unwatering of the shaft and levels. The water is being raised in large tanks by means of a strong double steam hoist, one tank descending while the other ascends. The water has been lowered to a point 500 feet from the surface, and it is calculated that about six weeks will be required to unwater the 150 feet yet remaining. Then the mine will be in condition to resume work, or to be examined by intending purchasers. Locally, it is thought the latter purpose is the main one in pumping out the mine. If the Ames estate of Boston, which owns the property, contemplated working the mine, they would before this have begun repairs upon the dilapidated equipment and buildings, to say nothing of the reduction of the crude ore already piled for roasting. But, as the mine is of unquestioned value, possibly one of the corporations whose experts will examine it may conclude to pay the price demanded by the Ames people. The water first taken from the mine when the last pumping operations began was strongly charged with copper. It was run through sluices filled with scrap tin, and every few weeks there was a clean-up of the precipitated copper cement. The water does not now carry so much copper in solution. Part of it is run upon the top of a large heap of roasted ore, left from old workings, and, after leaching through the ore, is conducted into sluices where the copper cement is obtained as before described. At present the clean-up every three or four weeks yields from 5000 to 6000 pounds of copper cement. This cement is excellent for the manufacture of red paint, or it may be smelted and the pure metal obtained. G. McM. Ross, who has charge of the property, is now in Virginia City, Nevada, leaving work in the hands of a local foreman.

The Royal Con. mines are two and one-half miles northwest of Copperopolis, in Salt Spring valley. The cluster of buildings about the mine has been given the name of Hodson, which is the postoffice address of the employes. Locally, the mine is often spoken of as Pine Log, which is the appellation of one of the claims in the group, the Royal, Ant Hill and Good-enough being other claims. All are incorporated under the title first given, with English people as stockholders. The original locations were made many years ago, but capital was slow to experiment with these mines, believing that they were too far west to be within the profitable mineral belt. This is a low foothill region. The present company, however, have demonstrated that, although they have a low-grade proposition, it is one of such magnitude that they are warranted in the further investment of capital. For two years they have been operating a 40-stamp mill. Ground is now being cleared and some of the lumber is on hand for a new 120-stamp mill, which will be erected on a site entirely apart from the present 40-stamp equipment. This will give the company 160 stamps. The hoist is located on the hill, nearly half a mile from the mill. The new mill will be considerably closer. Ore is run in cars by gravity, horses being employed to haul the cars back to the hoist. At the mine there is a fine friction hoist and an air compressor, both run by steam. Wood can be had for $3.50 to $4.50 per cord, so it is not probable that electricity will be used as motive power. Water power is out of the question, as no supply is available. Pure water for use in the boilers and in the mill is brought to a private reservoir holding over 1,000,000 gallons from Salt Spring reservoir, several miles distant, and pumped where needed. A Cornish pump raises some water out of the mine, but this is so strongly impregnated with salt and alkali as to be unfit for use. Although the ledge in the mine is of vast dimensions, and inclines but 30° from the horizontal, little timbering is necessary, as this is the best standing ground in the State. Of course, occasional pillars are left in the working to support the hanging wall. The mine has produced no waste rock, the entire vein matter being sent through the mill. The shaft is down 900 feet on the incline. At the mill, besides the forty stamps, there are twelve concentrators. A dynamo has been installed to furnish lights for the hoist, mill and town. About 100 men are given employment. Geo. Kemp Van Ee is Supt.

The Melones Con. G. & S. M. Co. is now doing little work on its properties at Robinson's Ferry. Operations toward the erection of the 120-stamp mill were discontinued early in the winter, when the impassable roads made it impossible to bring in the heavy foundation timbers. The grading and the cement work for the mill have been finished, and much of the machinery is on the ground. The big flume to convey water for motive power has been completed, but most of the work at the diverting dam in the river will have to be done over again next summer, having been carried out by the early flood

waters last fall. The tunnel that is being driven through Carson hill to strike the ledge near the other side is now in about 2000 feet, but there are still 2000 feet to run. On this part of the work there will be no cessation until it is completed. This will require several months. The tunnel will tap the lode 1200 feet from the surface of the hill. With an immense vein to work upon, there will be no trouble to keep the 120-stamp mill busy.

Angels, Feb. 5.

The Sheep Ranch gold mine, after being shut down for six years, has started its new 20-stamp mill. The shaft is down 1200 feet. Over 50,000,000 gallons of water were taken out of the mine since Sept. 1st, '99. There are sixty men working.

EL DORADO COUNTY.

At Nashville the Chicago M. Co. expect to begin work on their property soon.

KERN COUNTY.

The Tulare O. & M. Co., operating in the McKittrick fields, are reported to have struck oil at 400 feet. The tools went through several strata of jet, one 36 inches in thickness.

The California Construction Co. has a contract with the Power Development Co. to bore a tunnel at Kern River canyon, 8425 feet, to be tapped by adits, through which debris may be removed. Its course will be in the main parallel with the river; it will be 6 feet 9 inches high to the center of the arch and 7 feet 2 inches wide. A permit has been granted by the Secretary of the Interior covering that portion of the territory within the forest reserve. It is stipulated in the contract that the work shall be completed within 210 days.

LOS ANGELES COUNTY.

At Whittier the Home Oil Co. is putting up a 1000-barrel tank of corrugated iron, and putting in larger distributing pipes. Its No. 6 well is pumping 175 barrels daily. In the Central Oil Co.'s field rigs Nos. 21 and 23 are up, and Nos. 24 and 25 are ordered. The Fidelity Co. is figuring on a pipe line to the railroad.

MARIPOSA COUNTY.

Near Coulterville the Buffalo Bill, an extension of the Columbia, is bonded to a company who will begin work soon. A mill and mining machinery are on the ground.

Supt. Bisland of the Nameless mine has bonded the Elizabeth mine and will develop it in connection with the Nameless.

NEVADA COUNTY.

E. D. Boyle has bonded the Hussey mine in Willow valley, Nevada City district, and will soon begin operations.

Grass Valley Union: A crushing of rock from the Jenny Lind mine was made at the Maryland mill; the results were better than expected. Supt. Stocks reports a large ledge. The company intends soon to erect a mill on its property.

Herald: It is expected that all of the water will be out of the Coe mine soon, as the pumps have been running steadily for several weeks.

PLACER COUNTY.

The Michigan Bluff M. Co., at Michigan Bluff, has two shifts running. A large tunnel, well timbered, is now in over 300 feet. The company is operating the property formerly known as the Burns Con. Mexican Placer mining claim. The tunnel will strike 40 feet below the channel.

SAN BERNARDINO COUNTY.

The Rose G. M. Co., Victor, gives the cost of mining, milling and cyaniding there: Thirty-three tons of ore per shift of eleven hours are treated with one engineer, one crusher feeder, one laborer in the vat and one solution man operating the plant. The cost of treating one ton of ore, including cost of oil, fuel (wood), cyanide of potassium, lime and zinc, is $1.09; 10 cents per ton more is chargeable for discharging the vat; total cost, $1.19; average cost of mining, $1.25 per ton; total cost per ton for mining, milling and cyaniding, $2.24. Ore carrying only $5 per ton can thus be worked at a profit.

The old Waterloo mine, at Daggett, is now being worked by leasers. Forty tons of ore are daily milled, giving twelve ozs. in silver per ton.

SHASTA COUNTY.

William McDermott, now in Butte, Mont., says that with A. H. Tarbet he has a new option on the Afterthought group, in which the proposition will pass up to them on the payment of $50,000. On this sum a cash payment of $5000, says Mr. McDermott, has now been made, the putting down of a 300-foot shaft with which to determine the continuity of the ore shoot to commence at once.

SIERRA COUNTY.

The Oriental Gold Mines Co. has levied an assessment of 10 cents per share, delinquent March 10.

The Orient Gold Placer M. Co. has levied an assessment of 25 cents per share, delinquent February 28.

SISKIYOU COUNTY.

Near Cecilville the Summerville Co. have a new sluice and resumed piping.

A. B. Colburn is building a mile of ditch that will carry 1000 inches of water.

The King Solomon mine has resumed. The company intend to enlarge their mill capacity from 50 to 200 tons per day.

The Black Bear mine is running steadily with plenty of ore in sight.

J. Stepens of Etna has bonded for a year the Plowboy copper mine. A shaft 140 feet has been sunk and a tunnel is being run.

Yreka Journal: A carload of machinery arrived in Yreka for the mining dredger building at Hawkinsville, in Yreka creek.

Grayson of Oakland, who bought a quartz mine at Know Nothing in the Salmon River country, has men developing it.

TRINITY COUNTY.

(Special Correspondence). — At the Brown Bear at Deadwood the main tunnel is in 2600 feet. The pay ledge is about 1400 feet farther. At the present rate at which the tunnel is going in, it will be reached in about 200 days. This tunnel will strike the ledge at about 850 feet below the lowest level of the mine at a total depth of nearly 900 feet. The works will, in all probability, be moved to the mouth of Thorn gulch when the pay ledge is encountered.

At Laughlins the Van Ness ledges are being developed. The Keno and Five Pines, owned by H. J. Van Ness, will be worked the coming season. In the Baboon ledge, owned by J. Wess Moore, $12.60 rock was struck.

French Gulch, Cal.

At the Chloride both mine and mill are running steadily. Development work is being pushed and good ore taken out and milled.

Journal: The stamp mill now being built on the Bullychoop and Occidental mines will be completed and in running order in about three weeks.

TUOLUMNE COUNTY.

(Special Correspondence).—One of the best 20-stamp mills in Tuolumne county is on the Gagnere mine at Tuttletown—a property owned by ex-U. S. Marshal W. G. Long and his family and superintended by his son, R. L. Long. The mill was erected two years ago, and at that time crushed ore taken from the Gagnere mine through the shaft of the Merritt, adjoining it on the north. A legal dispute arose over the title to the Merritt property, and the hoisting of ore for the mill through its shaft was discontinued. This necessitated closing down the mill, except for the limited working of custom ore, and it will be idle until the Gagnere can be opened through an independent shaft within its own limits. Such a shaft, with three compartments, and substantially timbered, is now being sunk on ground above the mill. At a depth of 180 feet the shaft will reach the old workings of the Gagnere, and ore extraction can begin. In the meantime, the Gagnere is preventing, at its own expense, the filling of the Merritt mine with water, doing it with water skips at the Merritt shaft. The Gagnere Co. has two parallel veins, each yielding milling ore. The mill and the air compressor will be run by water supplied by the Gale Ditch Co., under a fifty-year contract, with a fall of 274 feet at the mill and 330 feet at the air compressor. The mill has an eighty-light electric dynamo. Four additional concentrators are to be put in. The new railroad building from Jamestown to Angels will pass within a few hundred feet of the works. The Gagnere now employs twelve men, and is expected to find place for four times that number within the next few months. Jas. E. Gallagher is foreman.

The Arbona mine, near Tuttletown, is an active and promising property. Its equipment consists of a substantial Parke & Lacy steam hoist (capable of sinking to a depth of 1500 feet) and a 10-stamp mill. It is owned by Stockton men, and the policy of the company has been to develop the mine with the profits of the business rather than to declare dividends. Ore is taken from the second and fourth levels. The shaft is now down 523 feet. The ledge is from 3 to 8 feet in width. The company contemplates a canvas plant and chlorination works. Twelve men are employed, with J. R. Sears as Supt.

The Eleanor, or Street, mine is north of Tuttletown. It was known as the Schaw & Schollar mine, and is largely owned by Fred Sutton of Sonora, who now has it bonded to Hayes, Hinckley and Potter of San Francisco, and is being developed. The shaft is 200 feet on the old ledge, and a crosscut has been run which strikes a parallel vein carrying ore. Considerable ore has accumulated, and it is proposed to start up the 6-stamp mill, which is run by water supplied by the Tuolumne Water Co. There is a small cyanide plant below the mill. The ore runs strong in sulphurets of high grade. George Bowers is Supt.

Jackass hill, near Tuttletown, was famous for pocket mines. Its sides and crest are honeycombed with shafts and "coyote holes," most of which have yielded some wealth to the prospectors. At present thirty men are at work on this historic eminence. In one of the Gillis mines the persistent searchers for wealth are down 180 feet, which is about as deep as any shaft was ever sunk on the hill. The slate formation is traversed with narrow ledges of quartz and these ledges expand in spots to heavily mineralized chunks, from which quantities of free gold are taken. One pocket was thrown out by a blast a few years ago which yielded $45,000. Within the past two weeks pockets containing $2000 have been extracted. There seems to be a fascination about this style of mining which those who follow it are unable to resist. They prefer it to the large, low-grade propositions of the mother lode. James Gillis of Sonora, the original of Mark Twain's "Truthful James," is the principal owner of Jackass hill.

The Norwegian mine, on the north side of Jackass hill, has in the past been something of a "pocket" proposition. From late developments it looks as if this character is about to disappear. In developing the mine by crosscutting, a ledge of different character has been struck. The pocket ledge was in slate; the ledge recently found is quartz, carrying free gold. The crosscut tapped the latter ledge near the bottom of the 538-foot shaft, and extends to the surface. It looks as if this mine had entered upon a new era. The air compressor and hoist at the Norwegian are run by water. The mill started on the 1st. Sixteen men are employed here. R. O. Hoskin is Supt.

The Bown M. Co. is operating the Bown mine, located on the mother lode, one-half mile south of the Stanislaus river. The present company bonded the property in '98. At the hoisting works there is a double steam hoist, with gallows-frame 55 feet high. Down the hill is a 20-stamp mill, constructed upon modern principles. The mill has been idle for some time on account of scarcity of fuel, occasioned by impassable roads. The shaft is down 550 feet; sinking goes on. Twenty men are employed. W. J. Rule is Supt.

Tuttletown, Feb. 2.

The Boston News Bureau hears that a stockholders' meeting of the Santa Ysabel G. M. Co. will shortly be called and that stockholders are organizing "to protect their rights." The president, who had just returned to Boston from the property, was to make an official statement to directors this week.

The Densmore mine has been sold to H. G. Dodds for a sum in excess of $130,000, of which $20,000 was paid down.

Carters New Era: The Seminole G. M. Co. has bonded the Seminole mine to D. C. Mitchell of San Francisco. L. J. Safley will act as Supt. and Mgr.

YUBA COUNTY.

The Priestly dredger at Smartsville is about ready to start.

COLORADO.

ARAPAHOE COUNTY.

A smelter for the Dorsheimer interests is to be built at Wheatland, eight miles from Littleton, fourteen miles south of Denver. The Post says the Dorsheimers own large copper properties in Arizona, and will ship their copper to their Denver smelter. Copper matte has recently been imported from old Mexico by Pueblo and Leadville smelters. The Argo smelter at Denver has been using it, and thus will have a competitor in the Dorsheimer plant. The Omaha & Grant and the Globe smelters have the lead process, their product having to be refined after leaving the Denver plants, whereas the copper matte is reduced to bullion there and is accepted by the United States mints. The process treats gold with high percentage of copper, and a smelter using it is saved the cost of transportation of precious metals that must undergo refining.

BOULDER COUNTY.

The chlorination mill at Eldora is to be started up again this month.

CLEAR CREEK COUNTY.

Idaho Springs News: A 10 H. P. gasoline engine and hoister are being placed in the tunnel of the Specie Payment mine. F. Stansfield is Supt.

It is proposed to utilize power from Georgetown in operating the old Lamartine and neighboring mines.

DOLORES COUNTY.

Mining Investor: Dolores county added nearly $500,000 worth of precious metals to Colorado's output last year. Actual figures are: Gold, $97,000; silver, $270,000; lead, $27,500; copper, $20,000; total, $414,500.

EL PASO COUNTY.

The Anaconda G. M. Co. wants to borrow $50,000 for development work. D. H. Moffat is president. The report of the financial condition of the company and of its mining operations for the year is as follows:

From Jan. 1st, '99, to Dec. 31st, '99.

REVENUE.

Ore sales: 9,325.58 tons mill ore, average net value $7.35.	$ 68,598 33
21.37 tons smelter ore, average value $112.86	2,411 91
Total	$ 71,010 24
Royalty	32 91
Bills payable	64,000 00
Total	$135,043 15

EXPENDITURES.

FREMONT COUNTY.

A new 500-ton chlorination reduction plant will be built at Florence, with W. B. Milliken of Cripple Creek as Mgr.

GILPIN COUNTY.

Illinois capital has started up the Old Town property, with G. K. Kimball of Idaho Springs as Mgr.

The Running lode near Black Hawk is employing fifteen men, all of whom are working on the tribute system. Shipments of concentrating ore are being made to the Rocky Mountain concentrator, which are giving fair results, and smelting ore which carries good values in lead is being shipped to the sampling works. This class of ore runs about $40 per ton.

LAKE COUNTY.

...(Special Correspondence).—The Morning Star group, under the management of E. D. Dickerman, is shipping from fifty to seventy-five tons per day of manganese ore from 90 to 500 feet depth. The work is all done under the tribute system.

Leadville, Feb. 5.

The Leadville Miner estimates the output of the Leadville mines for January at 85,000 tons.

About 175 tons of ore, values ranging from $6 to $20 per ton, are now being treated by the Boston Gold-Copper Smelting Co. by means of the Loder pyritic furnace.

The Maid of Erin lessees are mining fifty to seventy-five tons daily of crude zinc ore which goes to the Langon Works at Iola, Kansas.

Chronicle: Zinc-lead ore in considerable quantities is being sent from Lead-

ville to the American Zinc-Lead Works at Canyon City. Dr. Barthett, the manager and patentee of the process, pays for the gold, silver and lead, and uses the zinc in making paint. —Leadville mining men are discussing possibilities of wet processes as applied to the treatment of low-grade sulphide ores. In several mines experts estimate several million tons of such ore. The adoption of a wet process to separate the zinc, lead and iron is expected to successfully solve the problem. The first product of the tables is a lead concentrate with some iron and zinc. The tailings are run over another table, and what is saved is very heavy in iron, and with but little zinc or lead. The tailings represent the zinc product.

OURAY COUNTY.

The Blaine mine, near Ouray, is shut down, throwing forty miners out of employment. This and the closing of the Meldrum tunnel are locally attributed to "the Boer war."

C. Newman is in Ouray perfecting arrangements for a smelter at Ironton to treat low-grade ores there.

The tonnage produced in Ouray last year, notwithstanding the closing of several large mines temporarily, was much greater than during '98, and the values were almost trebled. The value of ore shipped was as follows: Gold, $2,250,000; silver, $910,000; copper, $127,300; lead, $122,000.

Post: At Ouray the American-Nettie will have a new 20-stamp mill and tramway. The tramway will be nearly a mile in lengh, the mine terminal being 1700 feet higher than the mill terminal. The longest span will be 1800 feet in length and have an elevation of 500 feet above the surface of the ground at the highest point. The stationary cable will be 1¼ inches; the endless cable will be 1 inch in diameter. The tram is automatic, the buckets being dumped without a man in attendance, and the ore is fed to the crusher by a hopper without any shovelers.

SAN JUAN COUNTY.

At Silverton the Sampson mill has begun to treat the ores of the American M. & T. Co.

At Silverton, the Iowa and Tiger Companies, two of the largest producers in the State, have consolidated.

TELLER COUNTY.

(Special Correspondence).—F. A. Walter, who has charge of the Blue Flag mine, on Raven hill, states that hoisting machinery will be put in, with the intention of working and shipping. A high-grade ore has been found at 118 feet depth. There are seven shafts on the group, and the showing near the surface is good.

Cripple Creek, Feb. 4.

(Special Correspondence). — Wilfley, Wood & Scobey of Denver have started their 100-ton concentration mill at Gillett, which is running on mill tailings.

Gillett, Feb. 5.

Work has been commenced on the new three-compartment shaft of the Portland, on Battle mountain. The shaft will be sunk to a depth of 1000 feet.

IDAHO.

ADA COUNTY.

The Rock Creek G. M. Co., capital $1,000,000, has organized. G. Mitten of Boise is agent.

BOISE COUNTY.

The Specimen G. M. Co., Ltd., has organized, capital $300,000, to operate in Boise county: principal place of business, Boise.

SHOSHONE COUNTY.

The Butte stockholders of the Consolidated Tiger-Poorman Co. have sold their stock for 49 cents per share. The total is about 250,000 shares, and this practically cleans up the stock of the old corporation and gives the New York company clear control of the mine.

Mullan Mirror: The Midnight tunnel is in over 200 feet. Two shifts are employed. The new tunnel is to be tapped at a depth of 500 feet.

MICHIGAN.

The Buffalo works of the Calumet & Hecla M. Co. say the company now has on hand at that place and ready for shipment 9,785,000 pounds of copper. The company is now working 267 drills in its mine.

MONTANA.

MADISON COUNTY.

The German Bar M. Co. has bought the Mollie Gibson dredger, near Laurin. The German Bar people have begun building a new boat near Junction.

The Pole creek placer mines are bonded to Montreal men and will be worked on an extensive scale.

PARK COUNTY.

G. O. Freeman, assignee of H. Bush, Mgr. Bush Con. M. & I. Co. of Jardine, has brought suit to recover $23,602.29 from the Bear Gulch M. Co., of the same place, alleged balance due the plaintiff for money advanced for the purchase of machinery, payment of wages and purchase of mines.

NEVADA.

LANDER COUNTY.

A. R. Holcombe has charge of the Copper Basin mines and has put men to work.

LINCOLN COUNTY.

I. W. Hawkins has sold to the Nevada & New England M. Co. a group of mining claims on the Nevada side, near the Homestake, for $20,000.

A cyanide plant of 150 tons capacity is to be put in at the Horseshoe mine.

STOREY COUNTY.

No more Con. California & Virginia ore, averaging in the mine car sample assays below $25 per ton, is to be sent to the Morgan mill for reduction, and in future all ore assaying under that value will be worked at the Kinkead mill, Virginia City.

NEW MEXICO.

BERNALILLO COUNTY.

Mgr. Posey of the Cochiti G. M. Co., Bland, reports the new treatment plant about ready to start. The old plant is producing $800 daily.

SANTA FE COUNTY.

Half a mile east of Dolores, F. P. Crichton has men at work on the building in which the Edison method of gold extraction is to be tested, at the head of the Arroyo Viejo.

UTAH.

SALT LAKE COUNTY.

The smelter of the United States M. Co. at Bingham is considered certain, Bostonians having agreed to buy $800,000 worth of first mortgage 7% gold bonds of the company.

The annual report of the Boston Con. of Bingham notes that the bodies of low-grade copper-bearing ore, with low cost of development and extraction, concentration and smelting, are expected to be the source of steady dividends. The management believes that a profit of $1 per ton can be derived from the copper-bearing porphyry now exposed. To determine the matter, Mgr. Newhouse has begun exploration of the ground by diamond core drills. He will continue exploring the high-grade copper sulphides already disclosed and block out the porphyry containing the low-grade ore, so that when the method of ore concentration has been decided on there will be a supply of ore for the concentration works. Thos. A. Edison has completed his examination and tests of a quantity of that ore, which was recently shipped him by a new process of his own, and which, if successful, will enable the company to make a greater saving of values, besides concentrating the ore at less cost. This process was described and illustrated in detail in the issue of April 30, '98. If Edison's experiments are satisfactory, it will enable the company to erect works at the mine, and the capacity of the works can be made to meet all the demands of the large body of that class of ore contained in the mines. Mr. Newhouse favors postponing the erection of the mill until Mr. Edison completes his tests. The milling department tests show that the tabulated results of the seven mill runs on the copper-bearing porphyry give a saving by concentration of an average of $3.10 per ton of crude ore based on an average price of 15 cents per pound for the copper contained in the concentrates produced. The average contents of the crude ore treated for these tests was 1.31% copper. The net profit to be derived from the concentration of this class of ore would be approximately as follows: Value per ton of crude ore saved by concentration, $3.10, less cost per ton of treatment mining, freight, smelting, etc., estimated at $1.50 to $1.75 per ton.

SUMMIT COUNTY.

Late arrangements at the Marsac mill at Park City, which will run on Ontario ore, ore thus described in the Record:

A large proportion of the ore passes the grizzlies and the remainder goes to a rock crusher of the Blake type situated on this floor.

The ore from the ore bins on the second floor is delivered to the rotary driers by belt elevators. These driers are also located on the second floor. Crude salt from Great Salt Lake is similarly delivered to these driers, and from the driers the ore is delivered by car to thirty stamps, and the salt to a 5-stamp battery.

The chloridized ore is piled on the cooling floor, where it remains for about two days before being transferred to the leaching department. From the cooling floor the ore is transferred to seventy-ton vats, seven in number, on the leaching floor where it undergoes treatment by the Russell process. These vats are 17 feet in diameter, 9 feet in depth and provided with canvas filter bottoms.

The capacity of the mill will range between sixty and seventy tons per day. The crushed ore, mixed with salt, is delivered by belt elevators to the Stetefeldt furnace. This furnace extends from the top of the building to the cooling floor, in which the ore is given a chloridizing roast. Producer gas is the fuel consumed in both the drying and roasting departments. This gas is manufactured in the mill from Rock Springs coal by partial combustion in a Taylor gas producer.

On the floor above the leaching vats are the chemical room and solution storage tanks. The chemicals used are hyposulphide of sodium, bluestone, soda ash, caustic soda and sulphur. The hyposulphide comes from Germany, the caustic soda and soda ash from Syracuse, N. Y., the sulphur from Nevada, while the bluestone is manufactured in the refinery here.

After the leaching process three products are obtained—lead carbonates, a mixture of base metal sulphides, and the regular sulphides, carrying the silver, gold and copper. The lead carbonates and base sulphides are shipped to the smelter and the regular sulphides are refined here.

All the products in preparation for shipment and refining pass through filter process, steam driers and pulverizers. Compressed air is used for agitating during precipitation and for elevating the leaching solution from the precipitation departments to the storage tanks, the stock solution being kept in constant circulation.

Tribune: The Ontario is working thirty stamps of the Marsac mill.

TOOELE COUNTY.

Material for the Mercur mill at Manning has been delivered.

Tribune: The deal between the Dalton & Lark M. Co. and P. T. Farnsworth, in which the latter undertakes the purchase of a large portion of the company's territory for $300,000, has been ratified by the shareholders.

WASHINGTON COUNTY.

Tribune: The sale of the Dixie group of copper mines, near St. George, is considered assured. The figure is $220,000.

SOUTH DAKOTA.

CUSTER COUNTY.

The shaft on the Grand Junction mine has reached a depth of 100 feet.

WASHINGTON.

FERRY COUNTY.

The mill for the Republic Con. M. Co. will be 253x315 feet, and will be terraced, as at the Golden Gate, in Mercur, Utah. On the upper tier there will be ore bins, capacity 800 tons, the crushing plant to be below. On the third tier will be three furnaces, capable of handling seventy-five tons; below will be the leaching tanks, 22 feet square by 6½ feet deep, with the solution tanks below them.

The Republic mine will build another 200-ton mill.

PIERCE COUNTY.

The Washington M. Co., on the Carbon river, near Fairfax, announce the discovery of chalcopyrite, assaying 10% copper.

WYOMING.

Work on the Kurtz-Chatterton, near Grand Encampment, is going on.

FOREIGN.

BRITISH COLUMBIA.

Premier Semlin of Victoria has answered the petition of the American miners in Atlin to President McKinley against the Alien Exclusion Act. He says the statements in the petition that four-fifths of the claims were prospected and located by Americans, and that citizens of the United States lost millions by the passage of the Act, are exaggerations and misstatements, and that any rights acquired by the petitioners have been preserved to them. He holds that men taking out miners' licenses did not acquire vested rights.

In a resume of results from '94 to '99, the Miner shows that in Rossland year by year the total values per ton of ore have decreased as the improved and cheapened methods of handling the mineralized rock have come into vogue. In '94 the value per ton was $40.69; in '95, $35.66; in '96, $32.66; in '97, $29.17; in '98, $22.20, and last year the values had fallen to $17.81. But, with every dollar of decrease, more and more ore came to be of marketable value. In '94 ore which contained less than two ounces of gold to the ton was not worth handling. The next year, despite the decrease of both copper and of silver, the amount of gold to the ton of the ore mined was just over 1½ ounces. In '96 the gold realized less than 1½ ounces. In '97 the proportion had dropped to 1⅓. The next year it had fallen to three-quarters of an ounce, and in '99 the percentage was just over 1½ ounces to the ton. The value set upon the gold in '94 was $16. In '96 and two following years the price given Rossland was $20, and in '95 and in '99, according to the abstract, the figure was but $19. In '94 the silver percentage was nearly 3 ounces to the ton, and the price averaged 60 cents per ounce. In '95 the percentage was 2½ ounces, the average price 57 cents. In '96, percentage 2⅓, value 56¾ cents; in '97, percentage 1⅞, nearly, value 59¾ cents; in '98, percentage 1½, value 55½ cents, and last year the percentage remained as in '98, but the average value obtained had increased to 62 cents. The figures showing the copper returns show noticeable results. While the total amount of copper per ton extracted from the ore has not varied very widely, yet the values have differed from year to year. In '94, 57½ pounds of copper to the ton, with an average price of 12 cents; in '95, 43 pounds, at 8¾ cents; '96, 41½ pounds, at 5 cents; '97, 26 pounds, at 4¾ cents; '98, 47 pounds, at 12 cents; '99, 43½ pounds, at 14 cents.

Gold in '94 formed 79% of the values of the total output. In '95, silver and copper both falling in the markets, its percentage rose to 85%. In '96, the same conditions continuing, it rose again to 89%. In '97, copper having about reached bottom and silver but slightly improved, it went to 93%. But in the following year, '98, copper got in and the percentage of gold fell to 70. Last year, copper still rising and the demand for silver being slightly accentuated, the percentage of gold to the other ores forming the value of the year's product fell to 61%. Copper began in '94 with a percentage of 17 of the gross output. By the next year, prices having fallen over 25%, the output of copper went down till its value only formed 11% of the total. The fall in the values continuing during the two following years, '96 and '97, the percentage first fell to 7 and then to 4. But, with the rise in copper, '98-'99, the percentage rose to 26 and finally to 34, forming slightly more than one-third of the value of the gross output.

A company has been formed and is about to incorporate in British Columbia to take over all his company's property. It will incorporate with a paid up capital of $500,000.

J. H. Patrick of the Caribou H. M. Co., on Quesnelle river, says that 120 whites and as many more Chinese and Japanese are employed during the working season. The face of the hill in which the gold is found is between 350 and 400 feet high, 120 yards wide at the bottom, and the pay streak is 120 feet thick. The water supply comes from two lakes, the larger nineteen miles away, the smaller ten miles away. Dams have been put in, raising the level of the lakes 8 feet and 45 feet respectively. The water is brought down to a point above the mine in ditches, whence it is run into two 30-inch pipes, contracting to 9 inches at the nozzle, with a fall of 420 feet. This head throws a 9-inch stream of water 300 feet before it sprays. The sluices are 7 feet wide, 5 in depth. Steel riffles are used in these sluices. The force of the water and rocks and earth dashing through the sluices wore off wooden blocks 1 foot thick every five days. The pay streak runs 25 cents to the ton. The last cleanup this season, thirty-three days, showed $100,000, or a little over $3000 a day of twenty-four hours.

The owners of the Velvet mine propose constructing a railway from Rossland to the mine. It has not yet been decided whether the motive power will be steam or electricity.

Rossland Miner: The output of the Hall Mines last year was 31,000 tons of ore. For the year ending on Sept. 30th the development work consisted of 2039 feet of drifting, 258 feet of sinking and 917 feet of upraises. Attention is now being mainly directed to the sinking of the big shaft.——The total amount of ore shipped from the Slocan from Jan. 1st, '99, to June 30th, '99, was 15,113 tons. From July 1st, '99, to Dec. 31st, '99, the shipments were 4310 tons.——J. C. Drewry, managing director Canadian Gold Fields Syndicate, Ltd., has bought the Commonwealth group, consisting of the Commonwealth, Republic and Sultan. They are silver-lead, the ore carrying grey copper.

A recent amendment to the mining law of British Columbia provides that the owners, agents or managers of every mine shall make yearly returns to the Bureau of Mines of the quantity of metal or ore wrought in their properties, and the number of persons employed above and below ground. The individual returns will not be published by the department without the consent of the owners, nor will the figures be available to the public save in the aggregate as given in the departmental publications, the information being intended for statistical purposes only. A maximum fine of $100 may be imposed for failure to comply with these regulations.

MEXICO.

The Calumet Mexican C. M. Co. of Chi-

huahua has organized in Denver, Colo., capital $100,000; P. F. A. Ryan, E. M. Basseck, L. D. Sweet.

The Compania Exploradora Sonorense has organized at Hermosillo, to prospect and develop Sonora mining properties; C. T. Von Petersdorf of Torres is Pres.; capital stock, $100,000.

THE KLONDIKE.

The name Klondike is generally used as a synonym for any part of the gold-bearing regions of western Canada and Alaska, while in fact it is the name of a comparatively insignificant river in British Northwest Territory. The Klondike gold district, strictly defined, embraces a portion of the drainage basins of the Klondike and Indian rivers, which enter the Yukon from the east near the sixty-fourth degree of latitude; the district thus probably includes an area of about 350 square miles. The Klondike is a shallow stream, flowing in a broad valley, and has a width of 100 yards at its mouth. There have been no surveys made of the entire river, but it is estimated to be about 120 miles long. For the first thirty miles of its course it is bounded on either side by hills of rounded outline and comparatively moderate relief; beyond this the river forks in a lowland, and the two most northerly forks rise in the foothills of the Rocky mountains. Terraces or benches are found on the Klondike and on its tributaries. Indian river is of smaller size, but has a similar character; and between these two rivers lies a mountain mass usually called The Dome. The Canadian geologists have not yet published the results of their investigations, but it is known that the bed rocks of the region are of schistose character, and they are probably of the same age as those farther west in Alaska, already described.

The important gold-producing creeks of the region, as far as now known, have their sources in The Dome. Those tributary to the Klondike flow in a northwesterly direction, while the tributaries of Indian river flow southwest. The pay streak lies on or near bedrock; the overlying deposit of gravel and fine material sometimes has a thickness of 40 feet. Bench as well as gulch claims are worked in the district.

Personal.

J. DYER, Mgr. Draper mine, Tuolumne county, Cal., is in Boston.

HORACE F. BROWN, M. E., of Chicago, is visiting Washington, Cal.

WM. P. DEWEY, formerly of San Francisco, is located in Denver, Colo.

J. A. QUALEY, Pres. Arizona Copper Smelting Co., is in Safford, Ariz.

LEO VON ROSENBERG of New York has returned to Los Angeles, Cal.

G. G. VIVIAN of Idaho Springs, Colo., has gone to Mexico to examine mines.

L. S. ROSE of San Francisco, Sec. La Suerte M. Co., is in Nevada City, Cal.

W. C. D. BODY is building a 20-stamp mill for the Standard M. Co. at Newcastle, Cal.

JOHN HERRON, Supt. Tomboy mine at Telluride, Colo., has returned from New York.

PERRY HALL, former foreman Junction mine, Soulsbyville, Cal., is visiting that locality.

S. F. PARRISH of Leadville, Colo., has taken charge of his British Columbia property.

JAS. CRONAN, late Supt. Zala M. M. Co., in Sheridan camp, Wash., is succeeded by D. M. Snyder.

F. A. C. PERRINE has resigned the professorship of electrical engineering in Stanford University, Cal.

L. A. SCOWDEN, a Junction City, Trinity county, Cal., mine operator, has returned from San Francisco.

SUPT. DOBLER of the Brown Bear mine, Deadwood, Cal., has returned to his mine from a business visit to San Fransisco.

D. E. BIGELOW of the Union Iron Works is in Weaver, Ariz., where he will erect a large plant for the Octave M. Co.

EBEN SMITH of Colorado is visiting Eureka, Utah, and after examining the Victor Jr. placer property in southern Oregon will visit California.

B. F. HALDEMAN is succeeded in the superintendency of the Bessemer department of the Cambria Steel Co., Johnstown, Pa., by W. C. C. Geer.

S. PENROSE, Sec., and C. McNeill, Mgr., of the Colorado-Philadelphia Reduction Co. of Colorado City, have recently visited Deadwood, S. D., where they have mining interests.

SUPT. J. B. HOBSON of the Cariboo mine, Quesnelle Forks, B. C., states that construction work is now finished and that next year the mine will be run full time on good gravel, and that there should be, under ordinary circumstances, 2,000,000 yards of gravel washed. He says the average of the channel gravel is about 21 cents per yard. The total expenditures on his mine to date amount to $1,200,000; total output, $520,000.

MARCUS DALY denies the statement that G. M. Hyams succeeds him in the presidency of the Amalgamated Copper Co. Mr. Daly's term of service with the Amalgamated Co. will not expire until next May.

BEN WILLIAMS, late of the Copper Queen, Arizona, has returned from a quest for copper in British Columbia. He and his brother, Lewis, are about to engage in mining operations on an extensive scale in California.

COMMISSIONER HERMANN of the General Land Office says that, in the matter of persons living on forest reserves making proof and obtaining title for their land, there is no general law on the subject, but the ruling of the Department had been and is now that, if the person had gone in before the President's proclamation setting aside the land as a public reserve, he could, at the end of five years' residence thereon, go into the nearest land office and prove up his land and get title for the same.

Industrial Notes.

—Nelson, B. C., is to have a smelter and lead pipe factory.

—The Sierra Railway Co. are running trains from Jamestown to Carters, Cal.

—Nearly 2000 men are at work on the coast railroad line at Gaviota and Santa Barbara, Cal.

—The Northern Pacific Railway Co. has bought the Everett & Monte Cristo, Wash., Railway.

—The Old Colony Trust Co. of Massachusetts is filing in California counties a $2,500,000 mortgage on the Sunset T. & T. Co.

—During January there were seventy-two oil companies organized in California with an aggregate capitalization of $17,025,000.

—A German publication states that the Philippine islands are among the few places where gutta percha trees will flourish, and suggests the cultivation of the trees as an opportunity for American enterprise.

—Colorado telephone people are extending their lines from Salt Lake toward Grand Junction. They have a local line between Grand Junction and Palisade, and one from Denver to a point near Glenwood springs.

—The Canadian Pacific has let a contract for construction of its Balfour extension and work has begun. It will cost about $500,000. It extends from Balfour, on Kootenay lake, to Five Mile Point, five miles west of Nelson, British Columbia.

—The Dawson City Water Works, over the hydrant of each customer, who pays $1 per week for the service, erects a wooden house measuring 6 feet in all three dimensions, each of which contains a stove in which the company keeps a constant fire.

—The Bellingham Bay & British Columbia Railroad have placed a $1,000,000 trust mortgage on their line of railroad from Whatcom to Sumas, Wash., to secure an issuance of bonds of that amount. The Bank of California is the mortgagee.

—Near Santa Cruz, Cal., the Big Creek electric plant is bought by F. W. Billing and J. F. Packard of Utah for $250,000, who intend to construct a duplicate pole line from Santa Cruz to Big Creek and raise the dam 10 feet, making it 40 feet high.

—A bill now under consideration by the Committee of the Senate on Public Lands provides that the State School of Mines at Golden, Colo., shall annually receive 25% of all moneys paid to the United States for mineral lands within the State of Colorado. It is stipulated that this sum shall not exceed $12,000 in any one year, nor shall it exceed the amount of money expended by the State for the school.

—The Division of Forestry will continue the investigation of Pacific coast timber begun last summer, and several parties will start in June for the redwood belt of California and the fir forests of Washington. The object is to compare the reproduction with the present depletion and to investigate the possibility of reforesting logged-off lands. There will be from fifteen to twenty-five men in each State.

—Much attention is being given at present to timber lands. Lumber companies are paying good prices for stumpage and a large amount of capital is looking for good timber within reasonable haulage distances. Timber claims are being hunted up in Oregon and Washington particularly, and many mineral prospectors have utilized their time during the snowy months of the winter in a search for good timber.

—At San Bernardino, Cal., in the Santa Fe shops are installed air compressors, the air being piped to all parts of the yard. When a "dead" engine is to be moved a hose is attached to an air plug and to a three-way stop cock that opens into the boilers just above the cylinders. The boiler is filled with air till the dial in the cab registers seventy-five pounds pressure. This air is then admitted to the cylinders, and one filling of the boilers is sufficient to drive the locomotive from the back shop into the roundhouse. In the olden days this would have necessitated a large force of men with pinch bars to get the engine off the pit and onto the track. There a switch engine would have pushed it up to a turntable and again the pinch bars would have come into play to put the engine in the stall. It frequently took ten men half a day to do the work air now does in fifteen mieutes.

—American commerce with the islands and countries of the Pacific shows a greater gain in the year 1899 than that with any other part of the world. Our total exports increased $20,000,000, and our exports to Asia and Oceania alone increased over $19,000,000. Our total imports increased $164,000,000, and $48,000,000 of this increase was from Asia and Oceania. Exports to Asia and Oceania increased 27%, while imports from that part of the world increased 40%. Of this increase of $20,000,000 in exports to Asia and Oceania, over $6,000,000 went to British Australasia, $4,000,000 to the Hawaiian Islands, $4,000,000 to China, and the remainder distributed to the various countries and islands of that part of the Western Pacific, while of the imports from Asia and Oceania $12,000,000 were from the Dutch East Indies, $11,000,000 from Japan, $9,000,000 from the British East Indies, $7,000,000 from China, and $6,000,000 from Hawaii.

—The Oakland, Cal., Enquirer notes the considerable income or earning capacity of a Pullman car. Every road in the United States pays 3 cents per mile for the privilege of hauling a Pullman car, and contracts to return it in as good a shape as it was received and to pay for all damages. The journey on the Owl train from the Oakland mole to Los Angeles, Cal., is 428 miles. On this there are generally two Pullman sleepers. The money paid, therefore, for the use of the two cars for one trip to Los Angeles is $25.68. If the cars are full, as is generally the case, the receipts from berths, sections and staterooms amounts to $185 per car or $370 for the two cars, making a total revenue of $395.68 per day. Out of this must come the wages of the porter and conductor, the cost of towels, sheets, soap, etc., the whole amounting to but a small sum, considering the revenue. Then there is the wear and tear and general depreciation, the daily refitting and repairing. Set these charges down at 10%, and give the car but five trips per week to Los Angeles, then the earning would be $46,294.56 per year.

Commercial Paragraphs.

THE Weigele Pipe Works, Denver, Colo., report orders booked for two pipe lines, aggregating a mile of pipe, for the development of water power in Colorado.

DRAPER & MCLEOD, assayers, have moved into new headquarters at 1736 Champa street, Denver, Colo. Both are graduates of the Colorado School of Mines.

THE General Electric Co. has a contract from the Sao Paulo Tramway, Light & Power Co. of Sao Paulo, Brazil, for a large high tension power transmission plant, to cost about $200,000.

THE assaying establishment of Abbot A. Hanks will be removed on the 1st prox. from 718 Montgomery street to more commodious quarters on the ground floor at 531 California street, San Francisco.

THE Denver Engineering Works, Denver, Colo., has an order for two silver-lead smelting furnaces for the Germania and Mingo smelting plants at Salt Lake City, Utah, and a set of crushing rolls for the sampling plant for the Globe, Arizona, smelter.

THE Jeanesville Iron Works Co., Denver branch, A. Middlebrook Mgr., report recent sales of two steam station pumps to a coal company; two electric power station pumps to another coal company; one high lift station pump to Leadville; two No. 7 sinkers to local dealers. The factory has an order from a Missouri lead mine for a large compound pump, long stroke.

Catalogues Received.

Catalogue No. 21 of the Hallidie Wire Ropeway, manufactured by the California Wire Works, San Francisco, gives some fine illustrations and good description of this form of aerial tramway. The newest thing in this line is the center clip, patented May 9th, '99, made in halves and drop-forged; an ingenious device. Profiles, blank estimate of cost, etc., accompany the pamphlet, which contains much valuable, up-to-date information on the subject.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING JAN. 30, 1900.

642,202.—AMALGAMATOR—J. L. Bradbury, S. F.

642,080.—ANIMAL EXTERMINATOR—F. Burman, Fortuna, Cal.

642,132.—TRACTION WHEEL—I. S. Kimbrell, Somis, Cal.

642,236.—CLASP—Fannie C. Larimer, Los Angeles, Cal.

642,243.—BEER FAUCET COOLER—Moran & Hoey, S. F.

642,474.—OVERSHOE—C. Moser, Fruitvale, Cal.

642,255.—TRAVELING CABLE GRIP—E. I. Parsons, S. F.

642,566.—SET SQUARE AND BEVEL—A. C. Smith, Los Angeles, Cal.

642,502.—SAWING MACHINE—Spencer & Neal, Sisson, Cal.

642,177.—FRUIT DRIER—E. Thompson, Pasadena, Cal.

32,172.—DESIGN—A. C. Ambruster, Los Angeles, Cal.

32,178.—DESIGN—W. W. Flewelling, Selma, Cal.

32,177.—DESIGN—M. Schichtl, North Yakima, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BEER FAUCET COOLER.—J. Moran and R. P. Hoey of San Francisco, Cal. No. 642,243. Dated Jan. 30, 1900. The object of this invention is to provide a means for cooling beer and like liquids while they are being drawn from the cask or containing vessel. It consists of a segmental, double-walled refrigerating casing having holes made through it at points between the upper and lower walls, and in line with the hole into which the faucet has to be driven, so that the faucet passes through the enclosed space of the chamber, and in direct contact on all sides with the refrigerating material. Swinging plates fit over the holes and are adapted to enclose the faucet after it has been inserted, and means are provided for securing it against the head of the cask.

TRAVELING CABLE GRIP.—E. I. Parsons, San Francisco, Cal. No. 642,255. Dated Jan. 30, 1900. This invention consists of a grip which is especially applicable for aerial traveling ropeways, in which the load is suspended from trolleys traveling upon a stationary cable, and moved by means of a grip connected with the trolley frame and adapted to be closed upon a traveling cable. The device consists of a slidable hanger guided by the framework of the supporting trolleys, a fixed gripping jaw carried by the hanger, a movable jaw carrying the screw-threaded nut, a screw journaled and turnable through the nut, and a rocker arm connected with the screw shaft, connections being made between the rocker arm and the sliding body and a traction cable which is adapted to be locked between these jaws. In conjunction with this are fixed rails at points where the rollers may be received, so as to transfer the weight of the load from the main supporting cable at points where the apparatus is to stop for any purpose.

Recently Declared Mining Dividends.

Franklin, Michigan, M. Co., 3%; Feb. 10.

Bunker Hill & Sullivan M. & C. Co., $21,000; Feb. 5.

Boston Get There Zinc Co., monthly dividend 1%; Feb. 10.

Swansea M. Co., Utah, 5 cents a share, $5000; payable Feb. 15.

Daly-West, Utah, 25 cents a share, $37,500; payable Feb. 20.

Empire State Idaho M. & D. Co., monthly dividend, 3%; payable Feb. 15.

Montana Ore Purchasing Co., quarterly dividend, $1 per share; payable Feb. 15.

International Silver Co., New York, 1¾% on its preferred stock; payable April 1.

Cordell Zinc & Lead M. Co. of Missouri, monthly dividend, 5 cents per share; payable Feb. 15.

Latest Market Reports.

SAN FRANCISCO, Feb. 8, 1900.

SILVER—Per oz., Troy: London, 27¾d (standard ounce, 925 fine); New York, bar silver, 59½ cts. (1000 fine); San Francisco, 59½; Mexican dollars, 48c.

COPPER.—New York: Lake, 1 to 3 casks, 16.75 cash; carload lots, 16½; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.00; Casting, 1 to 3 casks, 16.25; carload lots, 16.00. San Francisco: 17½@18. Mill copper plates, 23½c; bars, 25½@27c.

Morrison, Kekewich & Co. of London say: "It would appear that American consumption increased 45½% during 1899. We think that prices will be maintained at a high level for many months to come. Consumption promises to be on an enormous scale."

LEAD.—New York, $4.70; St. Louis, $4.70; San Francisco, $4.85; pipe 7½, sheet 8½, bar 6½c. London, Soft Spanish Lead, £16 11s 3d=4.73c per lb.

SPELTER. — New York, $4.70; St. Louis, $4.70; San Francisco, ton lots, 6c; 100-lb lots, 6¼c.

ANTIMONY. — New York, 9½c; San Francisco, 1000-lb lots, 10c; 300 to 500 lbs., 11@14c; 100-lb lots, 15@18c.

BABBITT METAL.— San Francisco, 10c.

IRON. — Pittsburg, American soft, $25.25; Scotch, $26.50; San Francisco, bar, per lb., 3½c.

STEEL.—San Francisco, bar, 12c to 20c per lb.

QUICKSILVER. — New York, $52.00; London, £9 14s; San Francisco, local, $51.50 ₱ flask of 76½ lbs.; export, $47.50.

PLATINUM.—San Francisco, crude, $16 ₱ oz.; manufactured, $19@22.

FERRO-MANGANESE. — San Francisco, ₱ ton, $30.

ZINC.—San Francisco, 5¾; slab, 6½c; bar, 8.

ASSAY LITHARGE.—San Francisco, 10c ₱ lb.

TIN.—New York, pig, $28.50; San Francisco, $30; bar tin, ₱ lb, 35c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 40c to 50c.

NICKEL.—New York, 40@45c ₱ lb.

BISMUTH.—New York, ₱ lb., $1.80 50-lb lots; San Francisco, $2.50 to $3 lb lots.

CANDLES.—Granite 6s, 16 oz., 40s., 12c ₱ set; 14 oz., 40s., 11c.

FERRO-TUNGSTEN.—New York, 60c; San Francisco, 75c (60%).

MAGNESIUM.—New York, $3.50 ₱ lb.; San Francisco, $4.50.

TUNGSTEN.—New York, ₱ lb., 75c; San Francisco, 90c.

POWDER.—F. o. b. San Francisco: No. 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9.

FUSE.—Triple tape, $4.35 per 1000 feet; double tape, $3.70; single tape, $3.45; Hemp, $2.55; Cement No. 2, $3.70; Cement No. 1, $2.95.

COAL. — San Francisco coast, yard prices: Wellington, $8; Seattle, $7; Coos Bay, $5; Southfield, $7.50. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.50; Scotch, $8; Cumberland, $9; Cannel, $9.50; Welsh Anthracite, $12.50; Rock Springs' $10.05; Colorado Anthracite, $14.50.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 34@36c ₱ lb.; carloads, 29@30c; in 10-lb. tins, 40c; sulphuric acid, 1¾c ₱ lb. 66° B; soda ash, $1.60 ₱ 100 lbs. 58%; hyposulphite of soda, 2½@3c ₱ lb.; blue vitriol, 5½@6c ₱ lb.; borax, concentrated, 7@8c ₱ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c ₱ lb.; caustic soda, in drums, 3@4c ₱ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ₱ 100 lbs.; chloride of lime, spot, $2.35@2.50; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, strictly pure, boiled, bbl., 68c; cs., 73c; raw, bbl., 66c; cs., 70c. Deodorized Stove Gasoline, bulk, 16c; do., cs., 22c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 15½c; do., in cs., 21½c; Lard Oil, Extra Winter Strained, bbl., 55c; cs., 60c; No. 1 bbl., 45c; cs., 50c; Neatsfoot Oil, coopers' bbls., 60c; extra bbls., 55c; cs., 65c; No. 1 bbl., 52½c; cs., 57½c.

UTAH and CALIFORNIA

Are two of the most magnetic names in the roll of States, and the best way to reach them is over the Rio Grande Western Railway, "Great Salt Lake Route." As the name intimates, the Rio Grande Western is the only line that passes directly through Salt Lake City on the way to California; and Salt Lake City and the Great Salt Lake are the two points which should certainly not be missed on your western trip, as they contain more interest to the average American than any two other points within the confines of the United States. Study the matter carefully and you will choose the Rio Grande Western for this reason as well as for the magnificent scenery, superb equipment and fast time. It is the popular route during the winter as in summer. Write to GEO. W. HEINTZ, General Passenger Agent, Salt Lake City, for particulars.

—FOR SALE BY—

The Eureka Company, OF SAN FRANCISCO.

ROOM 1, - 426 CALIFORNIA STREET, SAN FRANCISCO.

WANTED.

Wanted.—Experienced Metallurgist and Assayer.

A practical as well as theoretical knowledge of the treatment of ores by all the principal methods necessary. Address W, Mining and Scientific Press.

WANTED.—An Experienced Quartz Mine Superintendent, one who is familiar with stamp mills and concentrators, and who is also an assayer and mining engineer, to take full charge of mine and 10-stamp gold mill. Must furnish references, state salary, and particulars. Address "GOLD," Mining and Scientific Press, San Francisco, Cal.

WANTED.—A Second-Hand White Howell Roaster, also a Revolving Drier.

Must be in good repair. Address ARTHUR HENDEY, Agent, Copper Chief Mining Company, Jerome, Arizona.

Wanted.—Foreman for Twenty-Stamp Mill.

One hundred and fifty dollars per month and board. Address THE WM. HAMILTON MFG. CO., 316 S. Euclid Ave., Oak Park, Illinois.

WANTED.—A STAMP MILL MILLWRIGHT.

Permanent position; salary $1800 per year. Address F. T. SNYDER, The William Hamilton Mfg. Co., Nelson, B. C.

WANTED.—A COMPETENT MILL MAN

Who can take the machinery for a 10-stamp mill to a foreign country, erect same and run it for six months or longer. State experience, references and salary expected. Address all replies to W. L. L., care of the Editor of the Mining and Scientific Press.

WANTED.

A millman who has run Bryan Mills and who is competent to take charge of a mill as foreman; one able to do his own assaying preferred. Position in a foreign country. I. W., care of Mining and Scientific Press.

WANTED.

A Thoroughly Competent Foreman,

For Gold Mine in Eastern Oregon, to take charge of mining operations.

Salary $180 per month. Only men of experience, energy and first-class references need apply Address OREGON, care Mining and Scientific Press.

WANTED.

PARTY TO DEVELOP A COPPER PROSPECT,

ONLY FIVE MILES FROM RAILROAD.

138-foot shaft. Several tons of ore on the dump. High-grade rock. Address G. F. CLARK, Tempe, A. T., care of I. S. Watrous.

WANTED —Mining Capital to Prospect,

by practical and scientific mining expert, geologist and engineer of 25 years' experience. Will give two-thirds interest in all discoveries, locations and profits. Success assured. Can forthwith secure (by location) numerous copper and gold lodes showing good paying outcrops. Prefer California, but would go to Arizona, Mexico or Cape Nome. References. Address MINING ENGINEER, Box 24, Victor, Cal.

STOCKHOLDERS' MEETING.

Notice of Stockholders' Meeting of the Union Hill Consolidated Mines.

In accordance with a resolution passed by the Board of Directors of the Union Hill Consolidated Mines, a meeting of the Stockholders of this Company will be held at 11 o'clock in the forenoon on Tuesday, the 27th day of February, 1900, at its principal office, 320 Sansome St., room 24, San Francisco, California, to consider and vote upon the proposition to increase the Capital Stock of this Company to four hundred thousand ($400,000) dollars in 400,000 shares at the par value of One Dollar each.

JOSEPH H. MOOSER, Secretary.

Dated San Francisco, January 15th, 1900.

Experienced Mining Engineer (age 40) reports on mines and their economical development; ore dressing; processes; mining machinery and mill construction. References. P. O. Box 971, Denver, Colorado.

SITUATIONS WANTED.

WANTED.—By a Practical Miner and MINING BUSINESS Man, Position as Manager or Superintendent. Speak some Spanish. Would leave the United States if necessary. Good references. Address SUPERINTENDENT, this office.

STATIONARY ENGINEER

WANTS POSITION AS ENGINEER IN MINE OR MILL. Can give references. Address ENGINEER, 159 Fox Ave, San Jose, Cal.

Wanted.—Situation as Mill Foreman, Assayer or Superintendent of Mine.

Have long experience. Address J. O. STEWART, Danville, Cal.

ASSAYER

WANTS POSITION. Good references. Competent in other branches of mining. Address J. D. H., care this office.

Mining Engineer and Metallurgist, technically educated, with fifteen years of practical experience, is open for a new engagement as expert or superintendent. Specialty the treatment of rebellious silver and gold ores. Experienced in designing, building and running reduction works. Speaks and writes Spanish fluently. Address ALPHONSE BENO, P. O. Box 814, City of Mexico.

FOR SALE.

FOR SALE.—DIVIDEND-PAYING, HYDRAULIC placer. Extensive deposits. Old channel gravel, water, pressure, grade, dump, and gold. Rigid investigation invited. Thoroughly legitimate. Banking references. Owner. IDAHO, care of Mining and Scientific Press.

Mines for Sale.

A specialty made of developed properties in Mexico and the Southwest. Good mines and prospects are wanted. Bona fide correspondence of mine owners, capitalists and investors solicited.

H. B. RUNKLE, Mining Broker, El Paso, Texas.

Group of Gold and Silver Mines for Sale.

For sale on very reasonable terms, or leasing proposals will be entertained, a group of gold and silver mines in the State of Durango, with excellent old records and some good modern machinery.

For full particulars apply to MR. A. KEMPSON (Resident Agent), care of Mr. Stalcknecht, Durango, Mexico.

A BARGAIN.

3500 feet of 16-inch, 5 B. W. G National Tube Works seamless pipe. Kimberly joints. Immediate delivery.

Address PIPI, Room No. 140, No. 32 Broadway, New York City

STEEL RAILS FOR SALE.

400 Tons 40-lb Relaying T Rails with Plates.

One 30-Ton Saddle Tank Standard Gauge Locomotive, f. o. b San Diego, Redondo, or San Pedro, Cal. Correspondence solicited.

C. J. TALLON, 308 Market Street. San Francisco, Cal.

FOR SALE. **Relaying Rails**

For Mines and Street Railways.

LEE CHAMBERLAIN & CO., 155 North Main St., LOS ANGELES.

ERICSSON SWEDISH TELEPHONES

Seem to possess almost human intelligence. They respond to every requirement in a smooth, positive fashion that shows what a perfect telephone can do. Besides this they have unequalled strength and durability. Their reputation as "STANDARD OF THE WORLD" is built on merit. Is the best too good for you? ERICSSON TELEPHONE CO. 296 BROADWAY, NEW YORK.

SMOOTH-ON CASTINGS.

An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work applied by mixing with water; hardens quickly and expands in hardening. When hard it will withstand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

MESSRS. MADISON, BRUCE & SELLERS,

34-36 STEUART ST., SAN FRANCISCO, CAL.....AGENTS FOR PACIFIC COAST.

STEAM LOCOMOBILE FREIGHTING TRAIN.

CAPACITY OF WAGONS 16 TONS EACH, or total freight carrying capacity of train 50 tons.

CAPACITY OF ENGINE, 50 H. P.

THESE WAGONS ARE ESPECIALLY DESIGNED FOR STEAM FREIGHTING.

CAPACITY OF TRAIN, 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the world. Eighty of them in use on this Coast. They are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend grades as much as 10% to 20%, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on a firm and moderately level road.

Send for descriptive Circulars and Price List of Engines and Wagons. We solicit correspondence. No trouble to answer questions.

Estimates made for complete Steam Freighting Outfits. Address

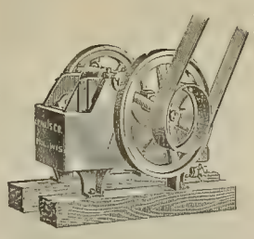
San Leandro, Cal., U. S. A.

RELIANCE ORE CRUSHERS



(BLAKE STYLE.)

FOR SILVER, LEAD AND COPPER ORES.

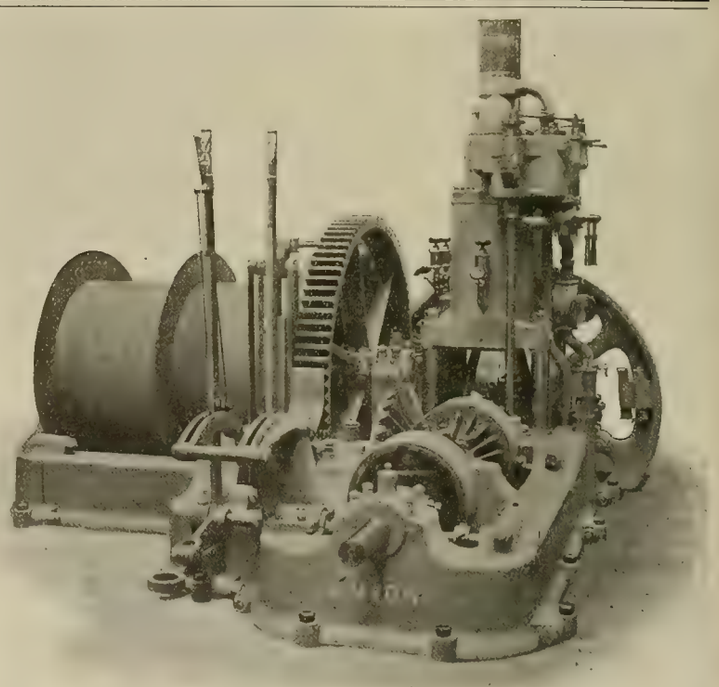
COMPLETE LINE OF SMELTER TOOLS.

CHLORINATION AND CYANIDE PLANTS.

COLLOM AND HARTZ JIGS.

HYDRAULIC CLASSIFIERS.

RELIANCE VANNER.



Single and Double Deck SLIME TABLES.

AIR COMPRESSORS AND HOISTING ENGINES.

THE EDWARD P. ALLIS COMPANY,

RELIANCE WORKS,

MILWAUKEE, - WIS.

The above illustrates the "Union" 25 H. P. double cylinder divided drum mining hoist for double compartment shaft. Cages and cars balance each other, therefore power is only used to raise ore; cost of hoisting ore is therefore reduced to the minimum. Made in sections for mountain transportation.

For Testing Placer Ground.

Sinks and drives 6, 8 or 10-inch pipe through boulders; takes all the loose material out, including gold, as the hole is sunk. Does the work at a very small cost. Drills water and oil wells and mineral test wells through any kind of rock to 1500 feet. Several sizes. Unexcelled for lead and zinc testing.

KEYSTONE DRILLER CO., Beaver Falls, Pa.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either MANUFACTURED or NATURAL GAS, ORDINARY STOVE GASOLINE (NAPHTHA or BENZINE), DISTILLATE or KEROSENE.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

GATES FINE CRUSHER.

The result of ten years' solid work. Success at last. What we wanted, and the public demanded, was a Gates Gyratory Rock and Ore Breaker (always adjustable and indestructible) so modified in design as to make one-half-inch product from three-inch sizes, rapidly and cheaply. The H. Fine Crusher will do this work. It takes the place of expensive big rolls and often prepares ore, without further crushing, fine enough for coarse concentration or cyaniding. In any event, it is the greatest and best intermediate machine between the coarse breaker and the pulverizer.

Ask for No. 1 Catalogue. :: **GATES IRON WORKS,** Dept. UU, 650 Elston Ave., CHICAGO.

Up-to-date Miners who value their lives use

NO. 3 LAMP.

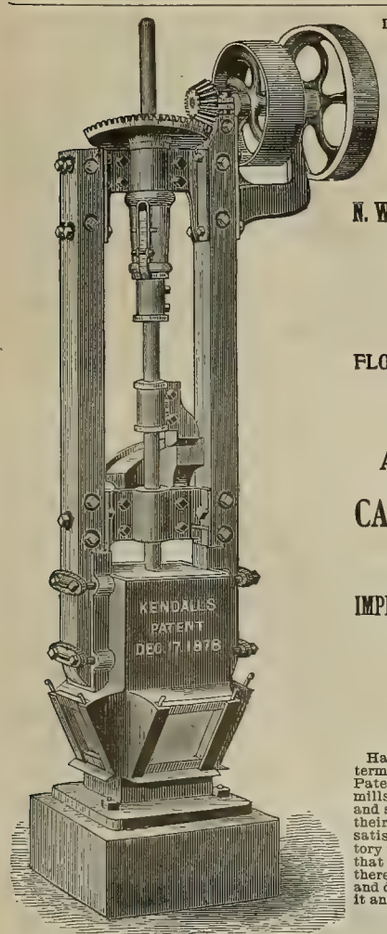
McINTYRE'S DRY BATTERY

PORTABLE ELECTRIC SAFETY LAMP.

ABSOLUTE SAFETY is Assured All Users.

This is an Electric Lamp set in a White Enamel Parabolic Reflector, and can be attached to the cap or any part of the clothing by means of a stick-pin attached to reflector and connected to the battery with a flexible cord. The battery is arranged to be carried on a belt or in the pocket. So the user has free use of hands. The current can be turned off when not in use. Dry batteries are used and can be recharged from direct Incandescent Electric Current. Charger and full directions go with each Lamp.

IS USED BY THE FOLLOWING:



For Watchmen, Miners, Mine and Gas Inspectors, Oil and Gas Works Employes, Powder Mills and Warehouses where explosive materials are manufactured and stored, where it is impossible to carry an oil lamp or candle for fear of explosion, and all parties requiring a safe portable light. The whole outfit is neat and compact.

MANUFACTURERS OF

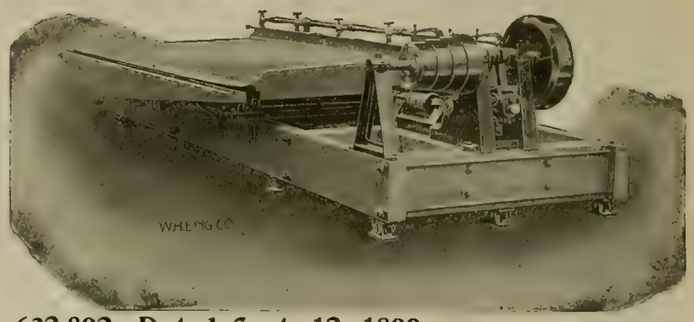
Smelting Furnaces and Equipments

For the Treatment of

Gold, Silver, Lead, Copper and Pyritic Ores.

THIS CLASS OF WORK IS A SPECIALTY WITH US.

We also manufacture all kinds of Ore Milling Equipments for Amalgamation, Concentration, Cyanide and Chlorination Processes.



(SEE PAGE 165.)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

We have reports from mills employing Cammett concentrators for the treatment of ores containing galena, iron sulphide and zinc blende, that they are regularly producing on each table three distinct concentrates—one of galena, one of iron sulphide and one of zinc blende, each of which is commercially clean.

Practical experience with the Cammett concentrator proves that it **saves** and **delivers** into the **concentrates box** slimes so fine that to prevent them from being lost from the **concentrates box** it is necessary to provide several additional overflow tanks.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of January, 1900, an assessment (No. 22) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of February, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 19th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of January, 1900, an assessment (No. 2) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of March, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, room 36, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 15) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of March, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 3rd day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 118) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Tuesday, the 13th day of March, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of April, 1900, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

CENTRAL EUREKA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sutter Creek, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 14) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 9, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of March, 1900, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 9th day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

WM. A. M. VAN BOKKELEN, Secretary

Office—320 Sansome street, room 9, San Francisco, California.

DELINQUENT SALE NOTICE.

MAY DAY GOLD AND SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Calaveras County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the 29th day of November, 1899, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Fanny Mayblum	61	50	$5 00
J. P. E. Heintz	57	1,000	100 00
J. P. E. Heintz	116	125	12 50
J. P. E. Heintz	129	4,000	400 00
J. P. E. Heintz	134	500	50 00
J. P. E. Heintz	135	200	20 00
Wm. A. Junker	71	500	50 00
Annie D. Weeks	133	500	50 00
C. G. von Treutler	127	400	40 00

And in accordance with law, and an order from the Board of Directors, made on the 29th day of November, 1899, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, Heald's Business College, 24 Post street, San Francisco, California, on TUESDAY, the 20th day of February, 1900, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

E. P. HEALD, Secretary.

Office—Heald's Business College, 24 Post street, San Francisco, California.

BRANCHES: NEW YORK, 26 Cortlandt St.; PHILADELPHIA, Bourse Bldg.; NEW ORLEANS, 316 Magazine St.; LONDON, S. E., 35 Gt. Dover St.; MEXICO CITY, Puente de San Francisco No. 6.

DO YOU USE GREASE?

Ideal. Marine. Jewel. Apollo. Tiger. Rex. Gem.

"The Lunkenheimer" cups will feed it. Endorsed by millions of satisfied users. In stock by dealers everywhere. Specify "The Lunkenheimer" and get the best.

Why Detroit Lubricators Should Be Preferred.

In addition to their many other good qualities, the Detroit Lubricators are made extra strong and heavy, each one being tested at a pressure of 300 lbs. to the square inch before it is allowed to leave the factory. This is probably twice as high a pressure as they will ever have to work under, so they are very durable and longlived, and, unless injured by accident, will not require any repairs for years. For this reason, they are particularly well adapted to users in the Rocky Mountain district and on the Pacific Coast, where it is expensive and inconvenient to get repairs. Our catalogue showing our different styles of sight feed lubricators, glass and brass oilers, oil pumps, oiling devices, etc., will be sent on application.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Gold Mining in the High Sierras.

The accompanying illustrations portray one of the highest gold mines in the United States. One picture shows the western wall of Lake canyon on the eastern slope of the Sierra Nevadas, in Mono Co., Cal. Near the summit of this rocky slope, at an elevation of 11,000 feet, lies the May Lundy and associated claims. The location of the boarding house and men's quarters is marked by a dark cross. The buildings can be dimly seen in the picture.

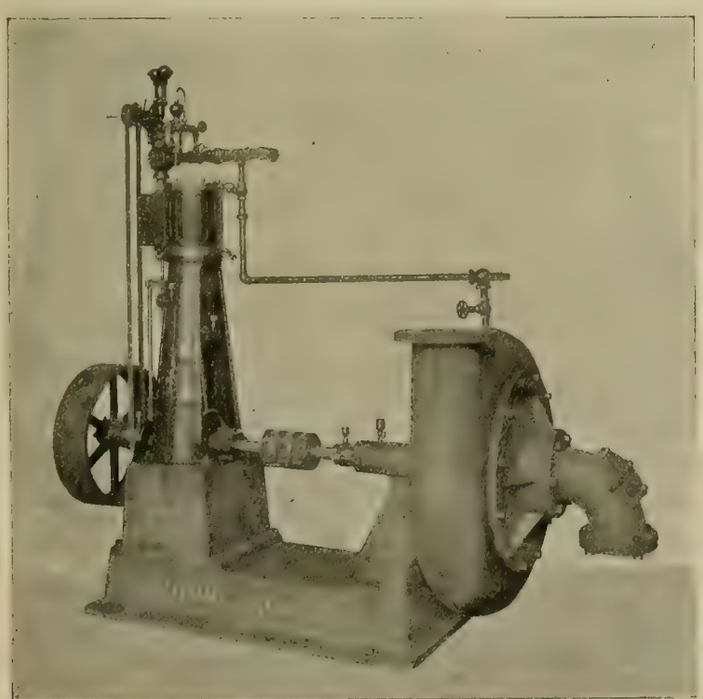
The mill is situated in the foreground, fully 1000 feet lower than the lowest workings and near the bottom of the canyon. The ore is delivered to the mill by means of a wire tramway, so that there is no interference from the snow, which lies here more than six months of the year.

Mount Scowdan, the eastern face of which forms the steep canyon wall, rises to a height of about 12,000 feet and is thoroughly seamed with quartz veins. The formation is generally granite, though toward the west metamorphic rocks appear.

Lake canyon is so named from a series of glacial lakes occupying rock basins. Two miles below the mill the canyon opens into Mill Creek canyon, not by a gentle grade but by a very abrupt descent of fully 1000 feet.

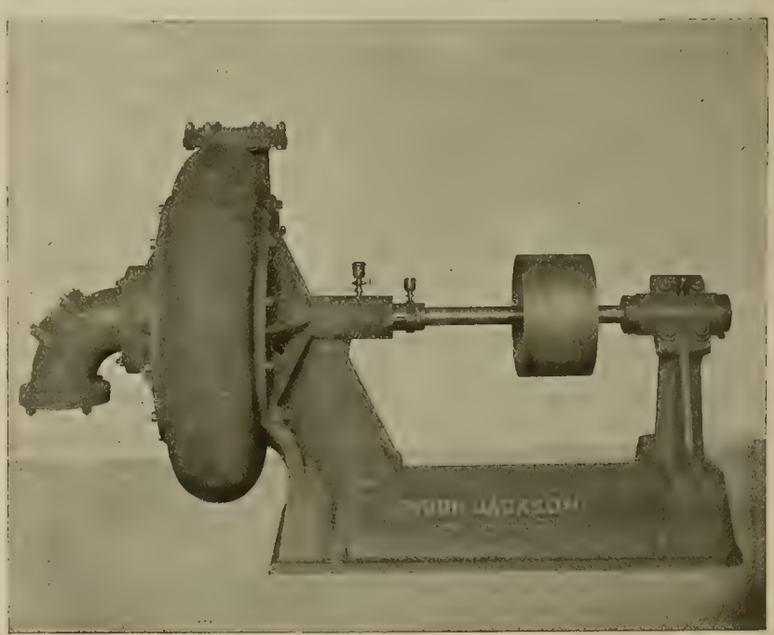
The scenery in Mill Creek canyon is also wild and grand in the extreme, as the accompanying illustration shows. At the far end of the lake lies the little mining town of Lundy, supported by the numerous claims about Mount Scowdan.

Looking Up Mill Creek, Mt. Scowdan on Left, Mono Co., Cal.



May Lundy Mill, Mono Co., Cal.

Pumping Plant for Cape Nome.



Cape Nome beach claims lie below high tide, being occupied and worked only under locally arranged conditions. Tundra claims include all those lying above the beach claims. Many of these are removed from the shore lines, located along the creeks or gulches, and for the most part dry. In all these mines a primary necessity is water and for almost all of them the water must be raised artificially by means of pumps.

Light pumping plants seem adapted to the requirements of the Cape Nome district; in many cases it is not only required to raise the water, but also the gold-bearing sand and gravel into the sluice boxes. The Byron Jackson Machine Works, of San Francisco, are constructing specially designed pumps and machinery to handle the entire material. Herewith appears a cut of their 6-inch sand and gravel pump arranged to be driven by belt from a steam or oil engine, built to handle solid matter up to 6 inches in size, and to discharge 25% of its capacity in sand or gravel. This would represent an ability to raise twenty tons of gravel per hour, and at the same time 90,000 gallons of water. This type of pump is reported as having been successfully used in other mining districts and is designed to be specially adapted to the requirements at Cape Nome.

There is also shown a cut of the same type of pump directly connected to high speed engine, making a neat and compact pump, which may be used exclusively for water, or for gravel and water pumping.

Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends; Commercial Paragraphs; Books Received, 184.

A CONSIDERATION of the factors controlling the copper industry leads to the opinion that the holders of good copper mining shares may look forward to a prosperous time. There seems to be small probability that copper production will ever be in excess of the absorption of the metal, although a temporary fall in price may occur during attempts to control stock. There is no reason why new mines, not excessively capitalized, with plenty of working capital and under good management, should not succeed.

THERE is a difference between a mining partnership and an ordinary or general partnership. In the latter enters the element of trade; the former is generally made for some specific purpose and is more limited in its rights, duties and requirements. In an ordinary partnership the act of one partner binds the firm. This does not usually obtain in a mining partnership. The presumption of liability for the acts of each other is much less in a mining partnership than in an ordinary or general partnership, and the partners share all the losses and profits. In a mining partnership the one creating or assuming liability for his associates must furnish more specific proof of his authority in that direction than that ordinarily required from partners in a business.

THERE is probably more effort expended in devising machines and methods for use in mining and metallurgy than is given to invention in any other line. Every day, almost every hour, some one appears with an apparatus which has overcome all the objections applicable to contrivances performing the function which the new machine is designed to fulfill. It is notable that the greater number of these panaceas emanate from sources where mechanical and metallurgical knowledge is least found. So true is this that there has been begotten a disposition on the part of men engaged in the business of metal producing to discourage, without investigation, any attempt to direct their attention to new things unless presented by familiar hands. This attitude is inimical to progress and undoubtedly retards the development of ideas of commercial importance to the two industries. It is true that new enterprises in mining and metallurgy adopt a dangerous policy in departing very far from methods the efficiency of which is well established; but, on the other hand, the efficient methods could not be so characterized until time had proven them, and they were open to suspicion at the beginning as the invention of to-morrow will be. It is probably due to the great attention given to invention in this field that there has been such marked progress in appliance and process. Yet the inventor of mining and metallurgical mechanism lives in an atmosphere charged with discouragement and it is an occasion for wonder when he accomplishes anything. Wholesale condemnation of new things just because they are new, is as open to criticism as indiscriminate laudation of untried means.

Pacific Coast Iron and Steel Manufacture.

Often through the years are received accounts of iron deposits in various parts of this west half of America, usually accompanied by the statement that, if Pacific coast consumers only understood or knew about the vastness of that particular ore deposit, and how cheaply it could be mined and ore and steel made therefrom, deserved attention would be given it.

It is in order to briefly say that Pacific coast iron and steel workers are advised as to the facts, are cognizant of the situation and alive to the necessity of the hour. Much effort has been given to releasing the handicap in the industrial race, but unsuccessfully. The conditions are peculiar and are too well known to all interested to need extended explanation. The present development of California oil affords hope that existing difficulties may be overcome.

Elsewhere appears an article that essays to give some statistics and exact data, and for this reason is given place as being worthy of attention.

Briefly, the situation is this: In the East and South iron can be produced much cheaper than on this coast. Alabama and Pennsylvania can make pig iron at a profit for $7 per ton. Iron ore exists in inexhaustible quantities from British Columbia to Lower California, fuel is scarce—comparatively—and, of course, dear. Some time ago the editor of this paper asked a "big" coal producer why he didn't develop an iron property owned by him, close to coal and manifestly valuable. His answer was, "Because it isn't business. Why should I put coal into the manufacture of iron, when I can get practically my own price for the coal direct, without the bother of putting the value in the shape of iron?" We knew just what his answer would be, but here it is—an unanswerable statement—from the coal producer's point of view. The fuel problem is ever present. As stated, California oil may aid in its successful solution.

In the above paragraph is given the most prominent point. There are other considerations.

The iron and steel business is in the hands of great capitalists—"great" as to magnitude of operations. Suppose the gentleman who wrote the article on page 178, or any other of 100 fairly informed men, were able to conclusively show that, all things considered, a ton of good iron could be smelted and sold as cheaply in San Francisco or Los Angeles, or Portland or Seattle, as could eastern or southern made iron, and that the investor had concluded to look into the matter. Upon inquiry he would find that he would have a fight on his hands from the start with the trusts and the railroads, and that unless he was prepared to put up enough to be independent of the big iron and steel combines of Illinois, Michigan, Ohio and Pennsylvania, he would be in a dependent position.

It is not the province of a mining and scientific paper to go into business details. Herein is simply indicated the difficulties in Pacific coast iron development. This whole matter is one of evolution. The big combinations that menace the Pacific coast iron investor were once small, feeble industrial concerns. This paper believes that in encouraging local manufacturers, in unity of thought, purpose and action, in a broad-gauge plan of industrial development lie the most potent possibilities in this direction. The law of supply and demand can not always keep undeveloped the Pacific coast iron mines. The signs are that dwellers at "the back door of the nation" will "about face," and be at the nation's front door.

THE extra session of the California Legislature has tried to straighten out the legal tangle of the non-repeal of the State mining law of '97; but this is all it can do, as no new legislation is possible till the next regular session, when a law should be passed making mandatory the recording of mining locations in the office of the county recorder. Such recording would be a necessity alike to locator and purchaser, would deter strife and litigation and form a sure starting point for subsequent research as to ownership of mining property.

THE report of the California Debris Commission is the result of elaborate and intelligent investigation of the question, and presents in new form a proposed solution of the debris problem in that portion of California affected by the necessity for impounding barriers. The plan entertains the construction of a series of dams, and the creation thereby of restraining barriers and impounding reservoirs, with further idea of contracting the channel of the Yuba river to increase its scouring capacity. The estimated cost of the proposed work is $800,000. There has been $500,000 available for several years.

An Executive Department of Mines and Mining.

Three bills have been introduced in Congress looking to the recognition of the importance of the mining industry of the country and some adequate Federal representation thereof. One is H. B. No. 20, by Congressman Gibson of Tennessee, "a bill to establish a bureau of mines and quarries," and, while it is probably well meant, is everything that such a bill should not be, and contains no elements worthy of commendation by the mining industry. It makes the whole thing cheap and petty, and, if enacted, would muddle matters more than they now are.

Congressman Osborne of Wyoming has introduced a much better bill, creating a national department of mines and mining, a secretary and assistant secretary of mineralogy and mining, and recognizing the importance of the industry. That bill is worthy of commendation and would not be opposed by any miner anywhere who understands existing requirements.

H. B. No. 5030, "a bill to create an executive department of mines and mining," was introduced on the 3rd ult. by Congressman Barham of California. Its full text is as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That there shall be at the seat of government an executive department to be known as the "Department of Mines and Mining," the general design and duties of which shall be to acquire, by examination, practical and scientific experiments, geological research, or otherwise, useful information on subjects connected with mining in the general and comprehensive sense of the word, and to diffuse same among the people of the United States.

SEC. 2. That said department shall be under the supervision of a secretary of mines and mining, who shall be appointed by the President, by and with the consent of the Senate; and section one hundred and fifty-eight of the Revised Statutes is hereby amended to include such department, and the provisions of title four of said Revised Statutes, including all amendments thereto, are hereby made applicable to said department.

SEC. 3. That there shall be in said department an assistant secretary of mines and mining, to be appointed by the President, by and with the advice and consent of the Senate, who shall perform such duties as may be required by law or prescribed by the secretary thereof.

SEC. 4. That the secretary of mines and mining shall receive the same salary as is paid to the secretary of each of the executive departments, and the salary of the assistant secretary of mines and mining shall be the same as that now paid to the First Assistant Secretary of the Department of the Interior.

SEC. 5. That the duties now imposed by all laws and parts of laws relating to mines and mining affairs exclusively upon any existing department of the Government, or any division or bureau thereof, shall, on and after the day this Act takes effect, be performed by the department of mines and mining.

SEC. 6. That the Geological Survey is hereby transferred to the department of mines and mining.

SEC. 7. That on the organization of this department all officers or employes wholly engaged in official work in any department of the Government, or any division or bureau thereof, engaged in the performance of the duties referred to in section five of this Act, and all such employed in the departments referred to in section six hereof, shall be transferred to the department of mines and mining.

SEC. 8. That all records, maps, documents, instruments, surveys, machinery, and other materials now in the possession and use of any existing department of the Government, or any division or bureau thereof referred to in sections five and six of this Act, are transferred to the department of mines and mining.

SEC. 9. That this Act shall go into effect on the 4th day of March, 1900.

The above bill is desirable, complete and deserving of endorsal. It realizes the extent and dignity of the great basic industry of the nation, it shows knowledge of the subject, and due desire to appropriately supply an existing necessity; it makes essential provision for the proper conduct of the work and justly aggregates much of the valuable work previously done to continue under proper direction. The transfer of the Geological Survey is a necessary part of the proposed legislation, and we are assured by representatives of that branch of the public service that no objection exists therein. On the 12th inst. the bill was favorably reported by the House Committee on Mines and Mining, and it is within the limits of probability that it may receive equal recognition by the Senate Committee this session.

The Barham bill would be of value to the nation and of benefit to the mining industry, and its passage would be in line with all national requirements.

Concentrates.

THE origin of El Boleo copper ores in Lower California is ascribed to volcanic action.

IN brazing steel, a wash of clay and black lead will prevent the solder or brass from flowing.

A STEEL CABLE 1½ inches in diameter, traveling twelve miles per hour, can transmit 1800 H. P.

PICTURES can be sent by telegraph. The process was fully described and illustrated in the issue of Sept. 7, 1895.

METALLIC PACKING is used for steam engine piston rods. It is made in metal rings, or mixed with other packing.

THERE are nineteen prisoners in the Montana penitentiary taking a course in the correspondence school of engineering.

TO A MINER "mineral" ordinarily means "ore;" "mineralized," charged or impregnated with metalliferous mineral.

BY USE of the quadruple effect distilling apparatus it is possible to evaporate thirty-six pounds water to each pound of coal used.

IN laying a pipe line twenty miles long, using 2-inch and 3-inch pipe, the least friction will be occasioned by laying the 3-inch pipe at the pump end of the line.

IN the explosion of gunpowder the carbon is oxidized to carbon dioxide, and the sulphur to sulphur oxides at the expense of the oxygen of the potassium nitrate.

A GRAVITY BATTERY does not polarize because the negative plate has no hydrogen set free on its surface. Copper is deposited there, and that is its own material.

THERE is no hydraulic mining carried on in Chile. A few small "trapiches" and Chilean mills are in use. Dry crushing is generally used, ball mills being in most favor.

DIVIDING the number of ampere hours by ten gives the working current. "Ampere capacity" is a technical designation of what is known as the "working current."

IT is stated that the Calumet & Hecla, Mich., will use steel pillars instead of timber for underground purposes next summer. Scarcity of good timber is given as the reason.

HYDROGEN is the most powerful gas for lifting purposes: 1000 cubic feet would raise seventy pounds. The same quantity of ordinary illuminating gas would lift thirty pounds.

A FIVE-TON Bessemer converter consumes 2400 cubic feet of air per minute. Blowers are now made to give at 200 revolutions 4600 cubic feet of air per minute at seven pounds pressure.

A ONE-EIGHTH H. P. dynamo would require an 8-inch motor, using a ¼-inch jet of water, twelve gallons per minute, running at 1200 revolutions per minute. The pipe could be ⅜ inch or 1 inch.

THE formation of the sulphate of zinc on the outside of the jars of a gravity telegraph battery ought to be prevented by coating the edges of the jar with melted paraffine wax. Coal oil may also be used.

ALIENS who have resided in the United States six months or more, and who have declared their intention to become citizens of this country, can be licensed as engineers or masters in the American merchant marine.

THE present development of California's oil resources favors the belief that sufficient oil may be thus produced to form an effectual element in the solution of the fuel problem, and thus materially aid in California manufacturing.

AMBER is a specialty of Prussia, a monopoly worked by a firm which owns the two best mines, Palmnicken and Kraxtepelle, for which concession they pay the German Government an annual royalty of 650,000 marks—about $162,000.

IN the case of supposed or alleged infringement of patent the novelty of a design is to be tested, not by investigation of the means employed for its creation, but by ocular comparison of the design itself with the prior designs in the art.

ELECTRICITY can not be considered per se to "cure" any disease of the human body; intelligently applied it may have helpful effect upon the muscular or nervous system, but the claims made for it in newspaper advertisements are not to be taken seriously.

A COLD-AIR ice machine's average production is two and one-half tons of ice per ton of coal consumed. There are machines that will produce ten tons of ice per ton of coal consumed. The Vulcan Iron Works, 535 Mission St., San Francisco, makes a specialty of refrigerating apparatus.

ALUMINUM can be cleaned and its mat restored by dipping for one and one-quarter minutes in a solution of three ounces of caustic potash or soda in a quart of water; then washing well and dipping in a solution of three parts nitric acid and three parts sulphuric acid (by volume).

THERE are several important devices that can be considered as in pairs, one of each pair being a "reversal" of the other. Thus the dynamo, which transforms mechanical into electric energy, on being reversed becomes the motor, which changes electricity back again into the mechanical form.

AN assay or a determination of specific gravity will distinguish between gold and an imitation thereof. As a rough test it may be said that gold should dissolve in a mixture of one part nitric with three parts hydrochloric acid; a residue indicates silver. If sulphuric acid be added to the solution a precipitate indicates lead.

SLIMES, after screening from scrap copper, are ordinarily about 4% of the total weight of the anode copper refined. They run from 15% to 30% metallic copper, 45% to 50% silver, a little less than 1% gold, and from 20% to 35% of other metals. The resulting bullion has to be refined. At Perth Amboy, N. J., and Baltimore, Md., they are boiled with dilute sulphuric acid.

THE best way to repair a commutator is to take it apart and replace the mica; but temporary repair can be made by using thick shellac solution and dry plaster of paris. Fill the crack with the shellac, then put on the plaster, kneading with knife blade until it is stiff and smooth. Let it dry six hours before scraping off the top even with the surface. It should be thoroughly dry before the armature is used.

MINERS AND MINE OFFICIALS are invited to use this paper as an interchange of information on practical mining subjects, modes and methods of doing practical, every-day work. Ideas and descriptions of how work was done are always of value, and if such idea or description can be improved on, an intelligent man naturally wants to know what that improvement is, so that he can use it, and thus be of more value to himself and his work.

HIGH-PRESSED steam is considered economical. It requires nearly as much heat to generate steam at the pressure of the atmosphere as it does to generate it at 200 pounds pressure on the square inch. Although in the latter case the temperature of the steam would be considerably above 212° F., yet, as the sensible heat of the high-pressed steam increases, the latent heat decreases, and the result is, it requires very little more heat to produce a pound of steam at a pressure of 200 pounds on the square inch, than that required to make a pound of steam at a pressure of fifteen pounds on the square inch. The use of high-pressure steam in modern engines is increasing.

"ROSETTE" copper is an obsolete product. It used to be obtained by the old method of refining black copper, which was melted in an open hearth with charcoal, the impurities oxidized away, and the copper rendered dry by the blast current. When the copper had become quite saturated with oxide of copper and red in color it was removed from the hearth in the form of "rosettes." This was done by allowing the surface of the copper to chill, and then lifting off the solidified cake. By repetition this was continued till the cavity of the hearth was empty. These "rosettes" were afterwards melted in a smaller hearth, where the reduction of the copper was effected.

TO MAINTAIN an electric arc 1 inch long requires about 118 volts. In an arc light produced by alternating currents both carbons are consumed at the same time, and both remain pointed. A bichromate of potash battery solution is made as follows: Water, 9 quarts; pulverized bichromate of potash, 2⅜ pounds; sulphuric acid, 7½ pounds. The powdered bichromate of potash is dissolved as far as possible in the water, and the sulphuric acid is added very slowly, stirring continually with a glass rod. The mixture heats by degrees, and the bichromate becomes completely dissolved: when once dissolved the solution remains clear, and crystallization does not take place upon cooling.

WITH a suitable field magnet, every foot of active wire on the armature of a dynamo will generate about 1.2 volts, when the velocity of the wire is about 40 feet per second. As the wire which lies in the neutral part of the field is 20% to 25% of the whole amount of wire on the cylindrical surface, the active part is 75% to 80% of the whole. For 110 volts the length of active wire will be 110÷1.2=92 feet of active wire, which must be embraced by one pole piece. On account of the wire being in two halves, in multiple arc, the length of active wire on one-half of the armature surface will be 92÷0.75=1.23, the whole length of active wire being 246 feet. The size of the wire will be determined by the allowable resistance.

"CONCENTRATES" confesses inability to answer a question asked simultaneously this week from three different sources—"We are offered what we want to take for our property, all but one man. There are four of us owning a good prospect, for which we are offered a fair price. Three of us are willing and anxious to sell; one won't sell, holding out for a bigger price. The proposed owner, the man who makes the proffer, says: 'Settle it among yourselves. I must have all the property and you must all sell together.' What is best to do?" That is a constantly recurring situation, and constitutes a hard question to answer. Where possible, it were better for the three willing to sell to buy the fourth man's interest.

CHLORINATION is more universally applicable to ores; the chemical part of it is comparatively simple. Cyaniding gives better results where all its chemical requirements are given full attention and the ore is peculiarly susceptible to its action. To say which is "cheaper" is impossible. The problem in all cases—commercially considered—is one of profit; there are cases where one would be a failure at any cost, and the other a success at comparatively little cost. The process must in all cases be suited to the ore. Find out what other people with the same kind of ore are doing. Get their experience. It may have cost them $20,000 or $30,000 to find out by costly experiment what was the best for them to adopt. Even then you must figure on conditions. No two cases are just alike, even when the ores are similar. It may be in your case that neither cyaniding, chlorination nor any other wet process is the best. Get some specialist, a good one, and pay him for good advice. Whatever pays the best, that is the best process, no matter whether the result is 75% or 90% of the assay value. All this, of course, from a commercial, not a chemical or metallurgical standpoint.

LITTLE has lately been heard of "argentaurum," a term used by Dr. Emmens to designate the result of alleged transmutation of silver into gold. It is or was possible by proper procedure to get some gold out of former Mexican silver coinage, but whether it was commercially profitable is doubtful. Finer assay and parting methods in Mexican mintage no longer admit of the former retention of gold in Mexican silver money, and the supply or source of "argentaurum" may thus be decreased. Of course, if any one wishes to believe that silver can be changed into gold it is his privilege to do so. So long as absurd belief does not occasion injury to others it is not to be restrained. This paper has fully discussed "argentaurum," and does not see any reason to change its views.

DOUBTLESS all rocks are slowly changing into the crystalline state. All the shales become sub-crystallized as slate; all the limestones become crystallized as marble; all the sandstones become crystallized as quartz. The first indications of change are noticed in the sandstones that are said to be micaceous—that is, they are seen to sparkle with reflected light from the little plates of mica forming in the interspaces between the grains of the stone. All the stratified rocks are undergoing a change from the stratified to the unstratified condition. Granite is considered to be the most primitive rock exposed to human observation. All known rocks have been derived therefrom—that is, the proportions in which the rock matter is contained in the granite correspond to the united composition of the different varieties of rocks.

VENTILATING pipes should always be as tight as possible, and when air is used under strong pressure, as with blowers and high-speed fans, the pipes should be perfectly airtight. Small leakages are not allowable, for as much power is used upon every cubic foot of air lost as upon the same volume utilized. The higher the pressure the greater the leakage through holes of the same area. Wrought-iron pipes are often used, but steel is coming into general use. The best styles are the spiral riveted or the welded seamless, when the air is at considerable pressure. For low pressures a cheaper style will answer. To protect against rusting, in wet mines, the pipes may be either galvanized (and regalvanized after riveting) or coated with coal tar or asphalt, applied at high temperature.

IN general, ore deposits represent a process of concentration of mineral matter either by chemical or physical means—that is, they are unusual localizations of certain minerals which are often found disseminated in smaller quantities in many common rocks, and they differ from the same minerals situated in other conditions only in their degree of concentration. There is a superficial alteration of nearly all ore deposits. The typical unaltered condition of gold in nature is in association with iron pyrites in quartz, and the effect of surface oxidation on such a deposit is first to convert the iron pyrites into hydrated oxidized iron minerals which permeate the quartz, turning it into a rusty brown mass. The next stage is the gradual leaching out of the iron minerals by the action of surface waters, while the gold which was originally in the iron pyrites mostly remains, though it may have been partially dissolved in one or more several ways. Sometimes, as for instance in Colorado, gold occurs in the form of telluride instead of in iron sulphide, and in such cases superficial oxidation causes the tellurium to be oxidized and the gold to be set free from its combined state. When such deposits as those described are eroded the particles of gold separate from the quartz and are concentrated in the streams as placer gold.

THE origin of ore deposits and mode of deposition can be conveniently observed at Steamboat Springs, Nevada, where clouds of steam issue from many vents, over a bare rocky space half a mile long, in a narrow valley lined by volcanic ridges on each side. The vents are separated but occur in parallel lines, showing that they are connected by fissures, filled with opaline quartz. The fissures traverse a continuous crust of deposited quartz, some open, some partly filled with quartz, water issuing from a narrow middle crevice. Some are wholly filled with quartz and have become true quartz-fissure veins. Some of these larger fissures are half a mile long, a foot wide, open and parallel, about 25 feet apart, and descending downward to the bottom of the quartz crust 30 feet, can be followed no farther because they have deposited quartz in such abundance as to cover up their original vents in the underlying rock. Water does not issue from all the fissures, but can be seen and heard 8 or 10 feet below in violent agitation from steam and carbonic acid gas. The quartz filling these fissures in the hottest parts is gelatinous, in others spongy, and in others hard, or in layers of agate, chalcedony or sugar quartz. Everywhere there is the same distinct ribbon or banded structure, resulting from successive layers of quartz being laid on the sides of the fissure by watery solutions. The quartz in these fissures contains sulphides of iron, copper, cinnabar and even free gold. The metallic contents, as in old fissure veins, are in much less proportion than the quartz veinstone.

The Silver Plating of Amalgam Plates for Gold Mills.

Written by ALLAN JAY CLARK, E. M.*

When, during the summer of '97, the silver-plated amalgam plates of the mill of the Homestake and Highland Mining Companies, at Lead, South Dakota, showed signs of wear an interesting question presented itself. There were about 300 of these plates, each 54″ wide, the length varying from 8′ to 12′, the latter size predominating. On account of the probability of a considerable accumulation of values upon these plates, as well as by reason of the heavy rates of transportation to eastern points, it was undesirable to ship these plates for retreatment, while their sale to a smelting company would have been equally inadvisable. On the other hand, the decreasing gold recovery as the silvered surfaces became worn was very pronounced and called for immediate action. It was in consequence decided to do the work at Lead, and the plant here described was accordingly installed.

The process of silver plating is of course well known, but in his investigation of the subject the writer found that but little of the literature was "up to date," while much was wholly misleading.

Moreover, the particular problems presented by these plates, so long covered with mercury and amalgam, could only be ascertained by experience. As the use of silver plates seems to be steadily increasing in the mills of this country, it may be of use to collect the notes of the operations of the first year and to describe briefly the methods employed and the difficulties encountered.

THE PLANT.—The operations (with the exception of the preliminary cleaning) are performed in a single well-lighted room, 28′x40′, connected with the assay office of the company. In this room are the motor and dynamo, solution tanks, working bench, painting racks, furnaces and water connections, while a wide platform, extending around two sides of the building, provides a convenient storage place for the painting, thereby giving more room for the operators inside.

In the absence of steam connections, the necessary heat for dissolving the silver for the solution, for heating the cleaning bath of potash, etc., is obtained from a pair of low furnaces placed at the side of the room, the heated products of combustion passing through flues 3′ 6″ wide and 16″ above the floor level. Over part of these flues is a hood, so arranged that it will carry off the nitrous fumes arising from the preparation of the solution, and will also, when the furnace is not in use, be available for the regular work of the chemical laboratory. A 2″ pipe supplies the necessary water. The floor throughout is of cement, sloping from the walls to the center, where a gutter carries the wash water, etc., to the drain. The power is taken from the main circuit of the company—a 110-volt incandescent light line—and drives a 7 H. P. motor, C. & C. make, especially wound, and directly connected with a dynamo, a Hanson & Van Winkle plating machine of 3 kilowatts and 800 revolutions. The foundations of the machines are of cement, raised about 2′ above the floor level. Although these machines are in no way protected from the corrosive action of the acid fumes or from the dust of the assay office, they have required no repairs beyond the reshaping of the dynamo brushes and a renewal of those on the motor.

The tanks are three in number:

1. The solution tank, inside dimensions 15′ 6″x30″, is of redwood 3″ thick, heavily strapped and lined with a thick layer of asphaltum. To apply the asphaltum, the tank, after being put together was laid on its side, the molten asphaltum poured in gradually and ironed smooth. The handling of this large tank is achieved by use of a traveling crane, which gives access to every part of the room, and is used as well for the daily handling of the amalgam plates. The spreading of these tanks when filled with solution is surprising, as much as 2½″ increase of width at the center having been noted. Great care must be exercised, either when filling or emptying, to correct this tendency with the straps. The tanks are set in pits 3′ deep, cement lined, and open to inspection on all sides, so that any signs of leakage may be quickly discovered and repaired. As a precaution against leakage, however, the pits are made large enough to carry all the solution in the tank, while at a convenient place a slightly greater depth is provided to pump out all solution so escaping.

2. The so-called stripping tank is similarly constructed and mounted. This tank was built for use in cleaning the old plates, and proving a failure, has been abandoned.

3. Outside of the building, and below the ground level, is a third tank of pine 10′x5′x5′, designed for use in storing the solution when repairs to the solution tank are necessary or when the solution has become so fouled as to require filtering. This tank is lined with a simple coating of asphaltum dissolved in turpentine, and as it is not designed to carry the solution for any length of time, its factor of safety is much lower. It is so placed that the solution may be siphoned to it.

HANDLING THE PLATES.—Holes are punched at intervals of 2′ along one edge of the plate, and through these long hooks are passed, which hang from a long crossbar suspended by a differential pulley from the crane. There are three bars provided to carry the plates while in the solution. When one plate is in the bath, only two of these are used; when two plates are treated they are hung back to back upon the middle bar while anodes are suspended on either side. These bars require a support at the center. To support the center bar, and at the same time to be able to remove one plate from the solution for inspection without disturbing the other (a very desirable feature), the arrangement shown in Fig. 1 is used. To

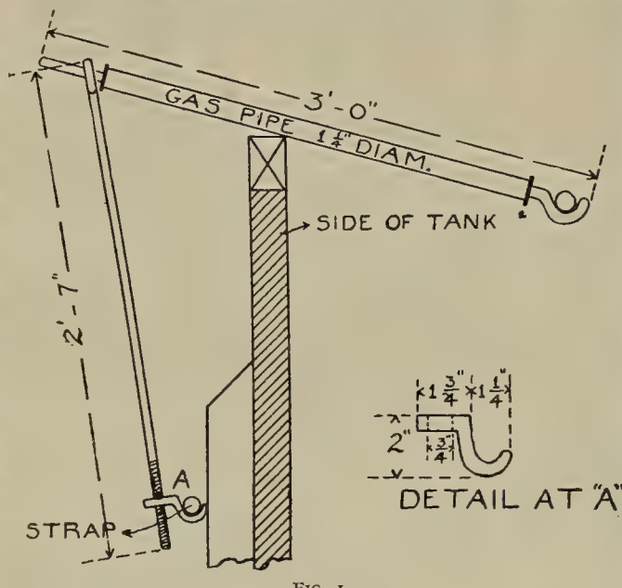

FIG. 1.

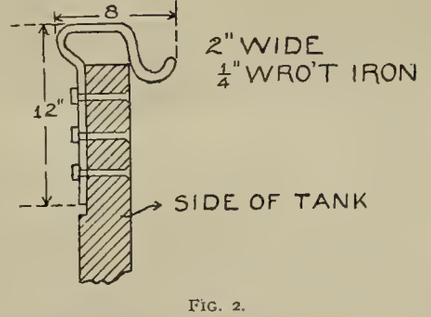

FIG. 2.

support the side bars the method is as shown by Fig. 2.

PRELIMINARY CLEANING OF THE PLATES.—To secure a proper contact of the silver with the copper surface, a contact which will resist the daily scraping of the amalgamators, the plate must be absolutely clean. The slightest trace of dirt of any kind will cause a flaw in the work. The effect of the usual interfering materials is as follows:

1. "Scale" due to oxidation rolled into the surface of new flakes the silver deposits upon it in a rough, lumpy state, easily scraped off.

2. Thin films of oxide forming if the acid treatment is not quickly followed by a thorough washing and an immediate immersion in the solution. With this, the silver may deposit unevenly, but with so slight a tenacity that it will be washed off by the impact of the wash water applied after removal from the bath. Very similar to the latter is the effect of grease or oil of any kind.

3. PRESENCE OF MERCURY.—This, of course, is only present upon old plates. The deposition of silver upon it simply forms amalgam, which scrapes off at once. To remove the mercury three methods were tried before a satisfactory process was found:

(a) Cleaning by hand with steel scrapers, followed by treatment with acid to remove the last traces of mercury. Abandoned as too expensive in supplies and labor, and because of the discomfort attending the heavy fumes.

(b) "Stripping" in the tank already mentioned. The plate suspended as an anode in a solution of potassium cyanide, using iron plates as cathodes, and recovering on them any mercury, gold, silver, etc. This attempt was successful in so far as cleaning the plate was concerned, but, owing to the uneven depth of the mercury upon the copper plate, the effect was to "pit" the surface, forming small ridges and hollows over its entire surface. Although a good deposit could be made upon these plates, they failed to amalgamate well, the heavier sands settling in the hollows and effectually preventing the contact of the gold particles with the amalgamated surface.

(c) The "stripping" was followed by the use of a power scraper, which was established in one of the mills. It consists of a table, to carry the plate, so mounted upon a track that every part of the plate can be brought under the buff; a buff wheel, with emery cutting surface, and a small suction fan to collect the particles removed and to discharge them into a box of water, from which they are subsequently recovered. Two men can readily clean three plates in a ten-hour shift, alternating with one another, as the labor is too severe for steady work. The plates come to the plating room in excellent condition for further treatment, and the use of acids and abrasives can be greatly diminished.

On the receipt of the plate from the mill it is set upon a rack and the reverse side painted, in order to "stop off" the deposition of silver upon that side. A solution of asphaltum in turpentine makes a thoroughly good paint, inexpensive, easily applied and quick drying; paraffine may be used, but it is not as good in any way. Asphaltum dissolved in benzine is to be avoided, as it is softened and loosened by the plating solution. The failure of a plant is harmful in two respects: (1) By the loosened particles fouling the solution, and (2) by the waste of silver deposited on the spot left bare. Two coats of paint are applied, and twelve hours are usually allowed to elapse between the time of the second application and the immersion in the plating bath.

The paint being dry, the final treatment begins. The plate is carried to the working bench, and there treated with one or more chemicals, as its condition may demand. This bench is stoutly constructed of pine and covered with asphaltum, applied in the same way as lining the tanks. It is sufficiently inclined to drain freely, a gutter at the lower side carrying off the washings. Several small frames of 1″ material, faced with rubber strips, are so placed as to carry the plate, allowing all washings to run freely beneath it and protecting the paint. Since finishing work for a time, a hood has been built over this bench, and a small fan will be driven by a line of shafting from the motor to assure more perfect ventilation. The solutions, or "dips," are kept in earthenware jars of twelve and twenty gallons capacity. When using, these jars are placed under the drain from the bench, and the "dip" is poured from eartherware pitchers. Rubber gloves protect the operator's hands.

The various cleaning operations, as already stated, are used as the condition of the plate requires. They are: (1) Scouring with sand or pumice stone; chiefly resorted to in removing scale. (2) Acid dip—equal parts of nitric and sulphuric acid, with 1% to 5% of hydrochloric—to remove oxides and any mercury which may remain; the effect of the sulphuric acid seems to correct the too violent action of the nitric acid upon the copper, an action which results in the "pitting" of the smooth surface. (3) Potash or soda lye—a strong solution preferably used hot, to remove grease, etc.; this solution is kept in an iron kettle, and is applied with a mop. (4) Cyanide of potassium. (5) Finally, cyanide of mercury is added, and without washing the plate is immersed in the silver bath; this tends to improve the adherence of the deposit.

PREPARATION AND WORKING OF THE SOLUTION.—The bath used is a solution of silver chloride in potassium of cyanide (the double cyanide of potash and silver), with an excess of potassium cyanide present. The action of the current is to deposit silver at the cathode while the liberated potassium cyanide replenishes the solution by dissolving silver from the anode. The excess of potassium cyanide insures a faster and more even working. In preparing the solution, granulated silver .999 fine is dissolved in nitric acid, the silver deposited as chloride by the addition of salt, washed and transferred to a large filter placed above the tank. The cyanide is deposited directly in the tank and the solution pumped through the filter until the silver chloride is completely dissolved.

For the particular work under consideration, good results may be obtained within a considerable range of strengths of the solution. A solution carrying 2½ ozs. silver and ½ lb. cyanide to the gallon gave very satisfactory results. Care must of course be taken to have sufficient anode surface, that the silver content may not be impoverished. From fifteen to twenty anodes, each ¼″x6″x3′–0″, were used per plate. The ordinary range of temperature does not affect the work. Presence of insoluble matter becomes troublesome after a time, and a filtration every six weeks is beneficial. Amperage and distance between anode and cathode affect the rate of deposition; voltage determines the character of the deposit and may be fairly constant. With a solution of the strength described, and a distance of 16″–17″, a current of 1½ volts is ample; with two plates 10″–12″ apart, 2 or 2¼ volts may be carried. The rate of deposition is .35 to .50 oz. per square foot per hour. The position of anode surface with relation to cathode surface must also be considered, as the current follows the least resistance road through the bath, and the placing of one or more anodes beyond the end of

* School of Mines Quarterly.

the cathode will result in a too rapid deposition on the edges of the plate, with its attendant evil, a "hard" or "burned" deposit—i. e., a deposit showing a slightly yellowish coloration instead of the dead white of the proper working, rather lumpy but thoroughly adherent. A slight excess of voltage shows a similar effect; a great excess emphasizes it largely, the deposit forming in a heavy, powdery crust.

A new solution does not work as well as an old one; time is required to secure an even mixture of the various compounds. After a day's work the solution is stirred, with this object in view. Small additions of ammonia and ether seem to help to correct this tendency of a new solution, but their use is rarely necessary. It is highly desirable to remove the plates for inspection after the current has acted for ten or fifteen minutes. Any unclean spots or any surfaces upon which the plating is imperfect are shown, and a few minutes' rescouring may remedy the evil.

When the work was nearly finished, and the plant was being prepared for a shutdown of several months, an effort was made, by use of a greatly diminished anode surface and a low voltage, to remove as much silver as possible from the solution.

ANALYSES.—To insure good work, careful watch must be kept of the solution, and silver or cyanide added from time to time, as required. The methods of analysis used are briefly outlined below. They were selected after a trial of several others as being rapid and sufficiently accurate.

FOR SILVER.—Twenty-five cubic centimeters of solution are taken; to this hot, concentrated solution is added at once an excess of alkaline sulphide (preferably K_2S_x). Lime is added to settle the precipitate quicksilver; then filter, dry, remove the precipitate to a scorifier; burn the paper and add it to the scorifier with some test lead; scorify and cupel, observing the usual precautions as to heat.

FOR FREE K (CN).—The usual $AgNO_3$ titration method is used, with KI as an indicator. It has been the writer's practise to use a solution of 6.535 grams of $AgNO_3$ per liter, a strength used in the cyanide process, and to employ a set of tables to calculate the value, rather than to prepare a special solution for this work. With this standard, 10 cc. of solution are taken, diluted to 200 cc. and to 10 cc. of the mixture titrated.

RECOVERY OF VALUABLE PRODUCTS.—The scrapings from the buff are cleared in a Knox pan with mercury. The resulting amalgam is squeezed, retorted and melted into small bars, which are added to the regular bullion from the mills. They make up about 7% of the total weight of bullion. About 200,000 ozs. of amalgam were recovered from plates, which yielded after retorting and melting over 14,000 ozs. of base bullion, of a composition ranging from 14% gold, 14% silver and 72% copper to 5% gold, 23% silver and 72% copper. The scouring sand, etc., is settled in a box placed in the drain, and is returned to the mill. It is not in a proper condition for this treatment, however, and it would be better to sell to a smelter. A small additional amount was recovered from this source. Old and worn anodes are remelted, cast into bars and hammered into shape for a second use.

The cost of the operation, including labor and supplies, need not greatly exceed the cost of the silver. The work of refitting all the mill with new plates occupied about six months, during much of which time four plates were plated daily with 2 ozs. of silver to the square foot. It was considered advisable to have a plant larger than the actual needs of the company, as the time during which the plant lies idle is more than made up for by the increased recovery of the mills when the plates are in good condition. Moreover, when the cost of the building is included, the additional expense incurred by doubling the capacity should not be over 20%. It would not be wise to limit the width of the tank too closely; slight irregularities in the solution might demand greater distance between anode and cathode to insure good work.

"That Deadly Gas."

Written for the MINING AND SCIENTIFIC PRESS by A. THURSTON HEYDON.

Every mining region has its own peculiar problems, and one of those peculiar to the frozen north is that presented by the "wood gas" resulting from thawing by open fires. This problem presents an unusually serious aspect on account of the number of deaths which it has caused; nor are these deaths the results of negligence, as is usually supposed.

The writer would simply state that, in spite of an extended experience with the noxious gases found in the workings of poorly ventilated mines, he has been hoisted out of a shaft lashed in a bucket and dead to the world, and since that time he has studied the gas problem and experimented with it fully as far as personal safety would permit.

One of the results of these investigations has been the proving, as nearly as can be without actually dying, that a person can die from the effects of the wood gas, as it is found in the workings of the Klondike, and at the same time a candle would not only burn well but brilliantly. This result is corroborated by the experiences of others, and many of these experiences have terminated fatally. By this it can be readily seen that the candle, which is the ordinary means of detecting gas in dangerous quantities, is utterly useless under certain conditions.

It is true that carbonic acid gas, being heavier than air, collects in the lowest places, the same as water, and will put a candle out immediately. It is equally true that carbonic acid, under the proper conditions, will rise and float through the air in such quantities that no human being can remain in it more than a few minutes, and yet at the same time a candle will burn well.

Carbonic acid gas will dilute with air until combustion can be sustained, and yet prove fatal to life; but then the candle will burn very dimly, while it takes some little time to produce unconsciousness. But yet in the case in hand the candle burns brightly. That is because that when the carbonic acid gas of a certain strength is cooled below a certain point it crystallizes into minute particles, which rise and float around in the atmosphere and dissolve under the influences of warmth and moisture. In that condition there is sufficient oxygen between the particles to sustain combustion, though the inhalation of the particles would knock a man out in short order. These particles can be seen when the light is just right, as sometimes occurs in the tunnels of the benches, floating in the air just as motes are seen in the sunshine, and all evidences of the presence of carbonic acid vanish when they disappear. These particles are exceedingly acrid, and upon contact with the mucous membranes of the eye and respiratory system they dissolve and produce inflammation. Every one who has worked in a shaft or drift after a fire, and nearly every one who has been on the creeks while burning was going on, knows the effect of the crystallized wood gas upon the eyes; also that even when the air is so free from gas that the eyes are unaffected a few minutes' work will stir up enough gas to make the eyes water and the nasal passages burn, and that this will occur days after a fire. As the candle is useless as a detector of carbonic acid in its crystalline form, reliance must be placed upon the eye and nasal passages, which are extremely sensitive to it.

The effect of a dangerous percentage of carbonic acid is that of a cumulative poison, as the amount of oxygen does not suffice to eliminate the carbonic acid produced by the system and that absorbed by inhalation. In consequence the amount of carbonic acid in the system increases until the thickening blood moves so slowly that unconsciousness results, and then it is only a question of time until death supervenes.

One of the moments of greatest danger occurs when a person nearly overcome by gas reaches the fresh air, as almost as soon as it is inhaled a person either becomes extremely faint or else collapses; so when in that condition a person should be tied to the rope or bucket to prevent falling.

The effect of carbonic acid, when there is enough oxygen to enable a candle to burn, is to cause a burning sensation in the eyes, while a sensation of closeness gives rise to a desire to emigrate. Next, a peculiar bewildered feeling steals over the brain, bringing a sensation of utter helplessness, while there is a flush of fever as the heart beats with more rapidity than strength, and the veins of the temples swell and throb. Then a feeling of death-like faintness and nausea brings an almost irresistible desire to either sit or lie down. This stage is followed by unconsciousness, although sometimes there is a brief interval during which the brain is remarkably clear and cool. The lapsing into unconsciousness is accompanied by a most delightful sensation of peace and rest, while it makes no difference whether school keeps or not. But the recovery is not so pleasant, as, aside from the discomfort of the giddiness, headache and nausea, it is often a matter of days and weeks before one feels all right again; besides, the knowledge that one has stood within the portals of death has a sobering effect.

When a person is working where gas does not exist in dangerous quantities a dash of water or a shovelful of snow has a wonderfully refreshing effect, and there is no quicker way to get oxygen down the shaft nor of revivifying a person who is so nearly overcome that he can hardly help himself.

In cold weather the smoke and gas roll out of the workings, but during the warm weather they hang heavy and cling to the cold, damp places. At such times a blower or fire blast is the only efficient means of removing the gas, although water dashed down the shaft or hot rocks, which convert the water into steam, with which the gas combines readily, is of great assistance.

The means used to revive a person overcome by gas are the same as those used for the resuscitation of a drowned person—the two most successful expedients, which alternate, being to lay a person on his face, stand astride of him, clasp him around the body just below the breastbone, and jounce him up and down, and then, holding him in a sitting position, raising his arms above his head and lowering them at rates varying from ten to twenty times per minute. This treatment should be kept up until consciousness is either restored or else all hope is lost.

Cyanide Plant at El Dorado Canyon, Lincoln Co., Nevada.

Written for the MINING AND SCIENTIFIC PRESS by A. E. VANDERCOOK.

The tailings of the Southwestern Mining Company that we are now running on were accumulated about twenty years ago, the ore being dry crushed in a 15-stamp mill and worked with a White & Howell furnace and pan amalgamated for the silver, saving a very small percentage of the gold.

Charles Gracey came here in '95 looking for low-grade gold ores, which he found in the mines and dumps, a portion of the values being free gold. After changing the mill to wet crushing and plate amalgamation, a test run of several thousand tons of ore was made with satisfactory results.

In '97, parties leasing the Dolly mill arranged to work the tailings by plate amalgamation and concentration, paying $1 per ton for same; some fifty tons were taken down the river to the mill, about a mile from El Dorado canyon, but they were unable to

Leaching Tanks—Cyanide Plant, El Dorado Canyon, Nevada.

make it pay and a sample was sent to me to experiment on. I made several tests by the cyanide process, which gave me from a .1% solution of cyanide 96.5% extraction of the assay value, which led to the erection of the present plant, consisting of one Dodge pulverizer, one solution pump, one zinc lathe driven by a 15 H. P. Daniel Best gasoline engine, eight

Tailings Pit, Showing Cemented Condition of Tailings, El Dorado Canyon, Nevada.

wooden-bottom iron leaching tanks 14 feet in diameter, 3 feet high, with false bottoms and discharge door, four zinc boxes 12 feet long, 1 foot wide, 1 foot deep, containing eight compartments, and two solution tanks which began operation in April, '99.

On November 1st, '99, I was placed in charge, under Charles Gracey, manager. Owing to the cemented condition of the tailings, which have formed a solid wall along the Colorado river bank, withstanding the high water, they are blasted and repulverized through a 10-mesh wire screen, delivering to the ore bin below and from there to the leaching tanks by cars, the tanks holding an average of fifteen tons each.

When a tank is charged with tailings a strong solution of .25% cyanide is forced up through the pulp from below until the tank is full, then the valve in the discharge pipe is opened and a weak solution run on

top and allowed to percolate for forty-eight hours, then sufficient waste water run on and the tank is allowed to drain. After a tank has perfectly drained, its contents are sluiced out; time required from one to one and a half hours, and the tank is then ready for another charge.

The discharge pipe carries the gold and silver solution to a sump tank. Owing to the fact of not having sufficient fall, the solution is pumped to another sump tank and the stream divided equally to each zinc box.

In the erection of the plant provision was made for only one pipe line to distribute the solution to the leaching tanks, which necessitated the shutting off of the weak solution while a tank was being charged with strong solution. By the present addition of another pipe line we are now handling a larger volume of gold and silver solution, keeping a continuous flow through the zinc boxes, and, by using a strong and weak solution, obtaining a higher extraction and a saving of cyanide. From the boxes the solution flows to the storage tanks.

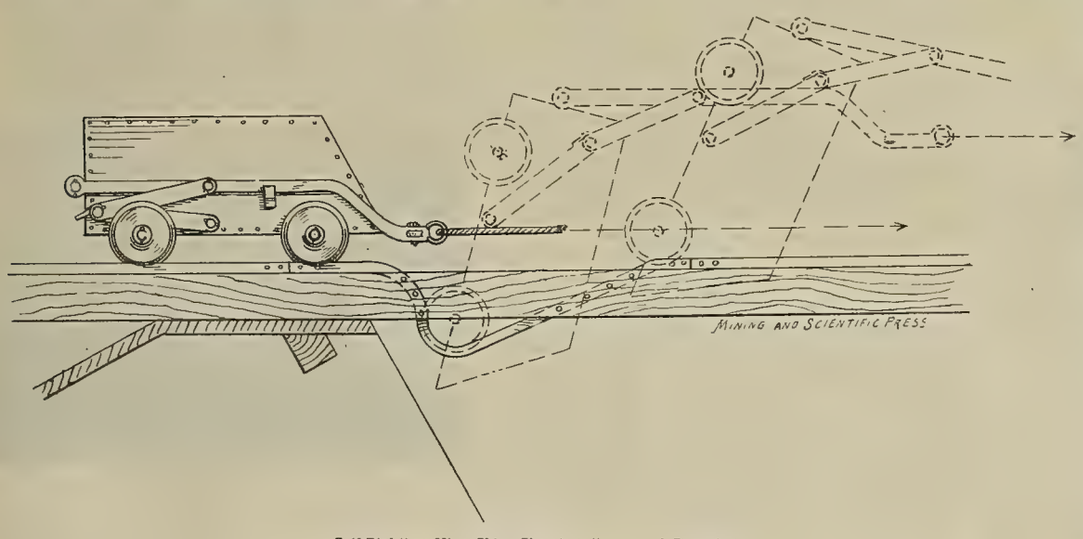
The strong solution returns to the zinc boxes carrying from two and a half to three pounds cyanide to the ton, which is used for the weak solution and to make up the volume of the strong solution which is standardized for the tanks following.

The tailings carry about equal parts gold and silver, producing high grade gold and silver cyanides. Under the present conditions they are extracting 95% of the gold and 65% of the silver.

They are now contemplating putting in a larger mill to work the low-grade ores, with a cyanide plant to treat the tailings. The ores being of a silicious limestone character, containing some coarse gold, the tailings are adapted to the cyanide process.

The mines were located in '61 (the district then was supposed to be in New Mexico) and are from six to nine miles from the mill. After an expenditure of a large amount of capital they were never made to pay, but now, with the cyanide process and traction engines to haul the ore at a very low rate, the low-grade ores of this camp can be made to pay a handsome profit.

Self-Righting Mine Skip.



TO THE EDITOR:—I send a sketch of a self-righting skip which I was called on to design at the Gambetta mine, Grub Gulch, Madera Co., Cal. The superintendent did not want the usual six-wheel self-dumping skip, as the space in the shaft did not allow much width about the skip. So these "bucking straps," as the miners called them, were apparently the only way to overcome the difficulty. The engine being solid clutched, no "bumpers" could be used to keep the skip from turning over at the dumping pocket, as an inch or two over the exact place would tear out the bumpers and the skip would turn over on its back. As the angle of the gallows track was 60°, the skip had to turn over one-quarter of a revolution to dump. If, by mistake, the engineer should run too far, the skip with the straps on would dump; and, while in that position, would continue out of the pocket and up the leeway track on its front wheels.

The design furnished and now in use there embodies three good points: First, no outside wheels; second, skip will not turn over in dumping; third, gives the engineer leeway.

The first position in the sketch shows it approaching the dumping pocket, with braces folded on the side of the skip body. The second position is that taken in dumping, braces preventing turning over. The third position indicates action of skip should the engineer hoist too high.

The braces are knuckled 2 inches out of line to avoid dead center and folding the wrong way, when refolding. In case rock jams in skip it can be raised and dropped back in the pocket, loosening its load. The skip weighs 830 pounds; capacity one ton.

Grass Valley, Cal. C. T. ROUNER.

Self-Righting Mine Skip, Showing Manner of Dumping.

San Bernardino Iron Mines.

Written for the MINING AND SCIENTIFIC PRESS by C. H. HUBBS.

The property consists of twelve claims, or locations, 600x1500 feet each, duly acquired under United States mining laws, of proper record and perfect title. The total area is about 250 acres. The property is divided into three groups, consisting of two, three and seven claims, respectively.

Group A of seven claims is situated upon Sections 27 and 28, Township 6 North of Range 4 East, San Bernardino meridian, and lies sixteen miles, nearly south, from a point on the Santa Fe Pacific Railway, about midway between Newberry and Hazlitt stations—273 miles by rail from San Diego and 180 from Los Angeles. Group B of three claims lies about two and three-fourths miles east-southeasterly from Group A. Group C consists of two claims, which lie about one-half mile east of Group B. Each group, in every desirable part, is accessible by rail connection, over a uniform grade of about 1%, the maximum possibly reaching 3% (down-loaded) from the main line of the Santa Fe. No cuts, nor fills, and practically no bridging would be required.

Whenever a justifiable quantity of ore is mined for shipment, tracks and rolling stock will be provided to move it. The freight costs to tide water would not exceed $2 per ton. The cost to mine the ore and load it upon cars would not exceed 50 cents per ton. The mines are situated in a timberless belt. Fuel, in the form of coal, oil or wood, would require to be shipped in by rail. Timber for building or mining purposes would be obtained in like manner, and at comparatively low cost. There is no surface water at the mines, and no steps have been taken to develop any. The chief chemist of the United States Geological Survey, after an examination of this ore, pronounced it "a very high-grade magnetic ore, with but a trace of titanium."

Pierre de P. Ricketts, ex-chief School of Mines and Metallurgy of Columbia College, New York, gave the following results from a determination made for the following elements only, viz.: Metallic iron, 68.84%; manganese, 0.038%; sulphur, 0.076%; titanium, 0.020%; phosphorus, trace.

Prof. Woulfe, chemist Union Iron Works, San Francisco, gave the following results from a carload each of magnetic and hematite ores sent to those works, viz.:

	Magnetic, %.	Hematite, %.
Sesquioxide of iron	66.80	81.94
Protoxide of iron	28.80	8.25
Alumina	2.843	3.24
Manganese oxide	0.52	0.43
Lime	0.72	0.82
Magnesia	3.83	3.18
Phosphorus anhydride	0.013	0.006
Sulphur	0.030	0.117
Silica	0.846	0.81

The Colorado Iron & Steel Co. gave the following analysis from samples aggregating fifty pounds, selected by the writer with great care from all the claims:

	Per cent.
Iron	66.25
Silica	1.68
Lime	1.38
Magnesia	3.32
Sulphur	0.031
Phosphoric acid	0.054
Alumina	0.84
Manganese	0.25
Iron peroxide	72.21
Iron protoxide	20.18
Manganese oxide	0.39
Phosphorus	0.024
Titanic acid	Nil

Best English or British Columbia coke can be laid down at San Diego by cargo at a cost of $7 to $7.50 per ton of 2240 pounds, and for a less sum at San Francisco. Tonquin, China, anthracite, almost equal to Pennsylvania hard coal, can be delivered at Pacific coast ports at $6 per ton by cargo.

The entire Pacific coast territory from Alaska to Cape Horn, the Hawaiian Islands, Japan and China would gladly draw their supplies of pig and manufactured iron and steel from California, were such commodities here produced. A 200-ton blast furnace would hardly be able to keep up with the demand. During the past two years tens of thousands of tons of iron have gone from Eastern and Southern States to the Orient via San Francisco, Tacoma or Vancouver, after adding the heavy charges for transcontinental shipment, and by direct water shipment by Suez canal or around the Horn steamers from California ports to Yokohama and Hongkong. To California — the nearest source of possible supply—belongs by right the greater portion of this export trade produced at home from abundant high-grade raw material with which this State has been so favored. Even so far back as 1896 there were imported into the port of San Francisco by rail more than 55,000 tons of manufactured iron and steel, exclusive of railroad material and pig iron. The magnitude of this business showing would be largely increased were it to include the large imports by water. During the same year the exports of machinery by sea to foreign countries from the same port amounted to over $627,000.

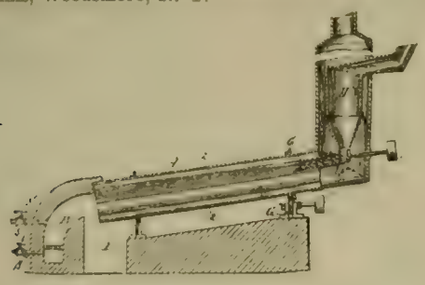
Pig iron at Pacific coast points of consumption commands at this time from $26 to $30 per ton, with an upward tendency, in sympathy with Eastern advances.

While it costs more to produce a ton of pig metal on the Pacific coast than in the East, the fact must not be overlooked that "cost to produce" is not the only element entering into the question of profit or successful production, or that a commercial value of $10 per ton is added to the iron on the west coast owing to transcontinental freight charges. The San Bernardino mines afford a much higher grade ore than the average reduced in the East or South. Our climatic conditions are far superior to those of either locality named, thus making possible less labor expense. The cost to produce pig iron at favored California points is, perhaps, $5 per ton greater on the whole than in the east of the Rocky mountains, but the metal is worth $10 per ton more here. Probably nowhere else in the world is so inviting, and at the same time so neglected, a field for profitable production. The approximate cost to produce a ton of pig iron at California tidewater from San Bernardino ores, using coke, as stated, for reduction would be as follows:

Mining 1⅛ tons ore	$ 0 80
Freight on 3584 lbs. ore	3 58
Lime	50
1800 lbs. coke at $7.50 per ton	6 02
Working charges	2 00
Incidentals	50
Total cost for 2240 lbs. pig	$13 40

Or if Tonquin anthracite were used in place of coke the cost per ton would be reduced to $12.20, or to $12.80 by consuming equal mixture of English coke and Tonquin anthracite.

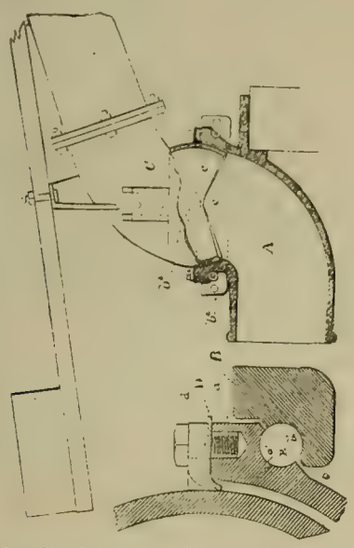
Within the past few years coke has depreciated at California centers of trade several dollars per ton, and it is not believed the limit of reduction has yet been reached. With a blast furnace plant established on this coast, consuming a fairly large amount of ore, fuel, etc., no doubt the transportation charges could be materially reduced. It will, therefore, be observed that the selling price of pig iron may be materially reduced, thus tending to a largely augmented consumption, and still leave a wide margin between cost and sale for profit.



To the conservative man whose vision is not confined within the narrow limits of the present, clouded by the adverse conditions of the past, or intoxicated by the bewildering possibilities opening to his vision as he glances over the waters of the Pacific to the new civilization rapidly rising in the Orient, in Asia and the islands of the Pacific, with their hundreds of millions of people emerging from semi-barbarism to the uses and demands of modern tools and machinery, who command the world's great lever—capital—the field is open in so wide a form that he must be broad of mind and well informed to grasp the magnitude of the opening offered to the iron industry. The field for expansion and profit is almost beyond power of human comprehension. The time is at hand, and the conditions at their maturity, when a man or a combination of men uniting the qualities mentioned, becoming impressed with the world's new center of commerce, will grasp and utilize this prize, and through it will command and control this industry upon America's west coast.

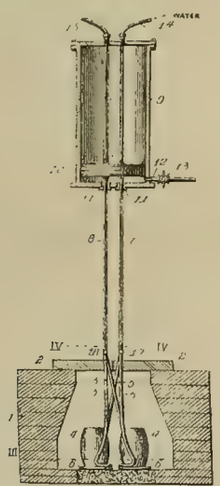
Latest Mining and Metallurgical Patents.

Patents Issued Feb. 6, 1900.



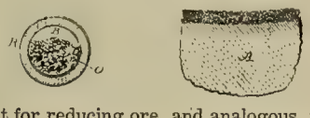
Specially Reported for the MINING AND SCIENTIFIC PRESS.

REDUCTION OF METALLIC ORES.—No. 642,584; C. G. Collins, Woodsmere, N. Y.



A process of preparing ores for extraction of metal which consists in mixing the powdered ore with powdered fluoride and subjecting mixture to temperature below fusion point in presence of water vapor.

HYDRAULIC GIANT.—No. 642,853; J. P. Simmons, San Francisco.

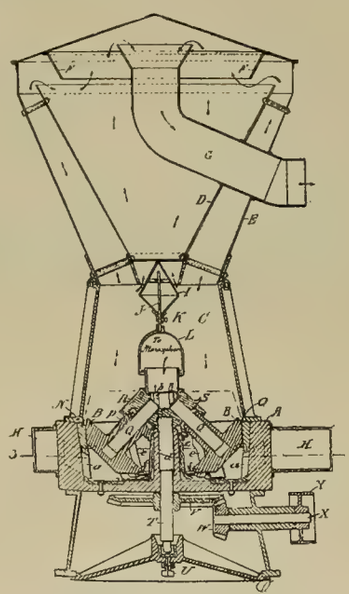


A hydraulic giant comprising stationary pipe having socket, curved movable section provided with ball joint adapted to engage with socket to form ball-and-socket joint therewith and exterior ring or washer adapted to oppose water thrust.

CRUCIBLE CARRIER.—No. 642,891; J. P. Bailey, Pittsburg.

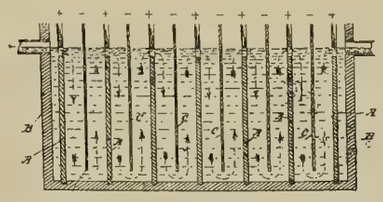
A crucible carrier having in combination a loop of pipe, its lower extremity shaped to form a series of two or more coils adapted to receive and carry a crucible and its upper extremities connected one with a liquid supply and the other with a discharge.

RETORT.—No. 642,722; B. Sadtler, Denver.



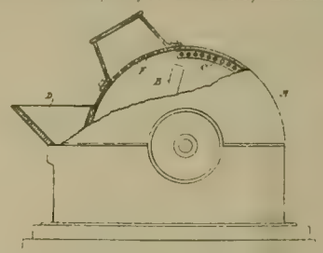
A retort for reducing ore and analogous purposes having body of fireclay, lining of basic material and a sintering material between body and coating chemically united to each.

CORE BREAKER AND LIFTER FOR ROCK DRILLS.—No. 643,082; M. C. Bullock, Chicago.



Combination with drill rod of annular cutting head movable endwise with recpect to drill rod, spring applied to extend cutting head, expansible core gripper and actuating means for core gripper embracing operative connections with cutting head, whereby core gripper is contracted when cutting head is thrown outwardly by spring, and extended when cutting head is forced inward by pressure against rock in drilling.

PULVERIZING MILL.—No. 642,717; A. Raymond Chicago.



In a pulverizing mill, combination with stationary bowl provided with crushing face on its inner periphery, of one or more rollers capable of free axial rotation upon fixed axes and free bodily movement parallel with axes thereof, but toward and away from crushing face of bowl and means for imparting orbital travel to roller or rollers, each roller having a single crushing face oblique to axes of rotation and parallel with crushing face of bowl.

PROCESS OF RECOVERING GOLD AND SILVER FROM CYANIDE SOLUTIONS BY ELECTROLYSIS.—No. 643,096; S. B. Christy, Berkeley, Cal.

A process of progressive electro-concentration and recovery of gold and silver contained in large volumes of dilute cyanide solutions containing free alkali resulting from extraction of gold and silver ores, tailings and concentrates, consisting first, in depositing gold and silver electrolytically from solution upon removeable cathodes sufficiently numerous and large in area to secure efficient deposition, in making removable original cathodes successively anodes in a smaller volume of cyanide solution and transferring and depositing electrolytically the thin film of gold and silver, already distributed over a large number of original cathodes, upon a smaller number of secondary cathodes, also contained in smaller volume of cyanide solution.

DUST PREVENTER ATTACHMENT FOR ROTARY PULVERIZERS.—No. 642,747; J. Kullman, Benicia, Cal.

An attachment for a rotary pulverizer, open at bottom and formed with curved bottom edge adapted to be fitted and secured to curved top or cover of pulverizer.

Cutting Timber on Government Land.

Land Office officials have an important circular letter regarding the cutting of timber on Government lands which have been taken up under the mining laws. It provides that land that timber is cut from under this provision of the law must be actually mineral land. A filing will not be accepted as proof of such character and there must be undoubted proof that the land has veins of mineral in it before timber can be cut thereon.

The circular follows:

Department of the Interior, General Land Office, Washington, D. C., January 18, 1900.—By virtue of the power vested in the Secretary of the Interior by the first section of the Act of June 3, 1878, entitled, "An Act authorizing the citizens of Colorado, Nevada and the Territories to fell and remove timber on the public domain for mining and domestic purposes," the following rules and regulations are hereby prescribed:

First—The act applies to the States of Colorado, Nevada, Montana, Idaho, Wyoming, North Dakota, South Dakota and Utah and the Territories of New Mexico and Arizona, and all other mineral districts of the United States.

Second—The land from which timber may be felled or removed under the provisions of this Act must be known to be of a strictly mineral character, and "not subject to entry under existing laws of the United States, except for mineral entry." Parties who take timber from the public lands under assumed authority of this Act must stand prepared to show that their acts are within the prescribed terms of the law granting such privilege, the burden being on such parties of proving by a preponderance of evidence that the land from which the timber is taken is "mineral" within the meaning of the Act.

Third—The privileges granted are confined to citizens of the United States and other persons, bona fide residents of the States, Territories and other mineral districts, provided for in the Act.

Fourth—The uses for which timber may be felled or removed are limited by the wording of the Act to "building, agricultural, mining or other domestic purposes."

Fifth—No timber is permitted to be felled or removed for purposes of sale or traffic, or to manufacture the same into lumber or other timber product as an article of merchandise, or for any other use whatsoever, except as defined in section 4 of these rules and regulations.

Sixth—No timber cut or removed under the provisions of this Act may be transported out of the State or Territory where procured.

Seventh—No timber is permitted to be used for smelting purposes, smelting being a separate and distinct industry from that of mining.

Eighth—No growing trees of any kind whatsoever less than 8 inches in diameter are permitted to be cut.

Ninth—Persons felling or removing timber under the provisions of this Act must utilize all of each tree cut that can be profitably used, and must dispose of the tops, brush and other refuse in such manner as to prevent the spread of forest fires.

Tenth—These rules and regulations shall take effect Feb. 15, 1900, and all existing rules and regulations heretofore prescribed under said Act by this department are hereby rescinded.

W. A. RICHARDS,
Acting Commissioner.

Approved, Jan. 18, 1900.
E. A. HITCHCOCK, Secretary.

International Mining Congress.

TO THE EDITOR:—There have been up to the present time over 1000 delegates to the International Mining Congress, appointed by the Mayors and Governors, Boards of Trade and other business organizations, while over 100 mining engineers have up to the present time signified their intention of being in attendance at the Congress. We have been promised the Colorado State exhibit, as well as the Cripple Creek exhibit, and northern Wisconsin and northern Michigan are going to send a very extensive exhibit of iron and copper ore. From the present outlook the International Mining Congress of 1900 is going to be one of the most important conventions ever held in this country.

T. J. SULLIVAN, Sec'y.

Milwaukee, Wis., Feb. 8.

IT seems impossible to impress miners and prospectors with the danger of thawing dynamite. The last addition to the list is from Idaho, where two men were killed last week.

Masonry Dams and Retaining Walls.

NUMBER I.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE T. PARDOE.

The author, in the course of his experience, has often noticed the absence of knowledge concerning the main principles underlying the design of such works by men in foreign countries, the result being that such works, if safe, are often unnecessarily costly, or, on the other hand, great risks are often unwittingly taken.

Although the author has used the above double title, there is no essential difference in the principles involved in the design of either works, the principal differences being more in the direction of "construction" than of "design," and the ordinary work for which miners and similar persons would use retaining walls are not usually of such a character that a failure would cause very serious damage and, consequently, a lower class of material and design than would be admissable on a dam for holding up water, would often suffice. The author is, however, very strongly of opinion that, except for pure temporary purposes, the best work is the cheapest in the end.

In the case of a masonry dam for holding up water to form an artificial lake for the purpose of water conservation, the best work possible under the circumstances of the case should be used, and no care or material should be spared to ensure the absolute safety of the work, since it is costly in all cases, and a failure often causes serious damage, apart from the loss of water and interruption of the supply.

In order to save time and space, it is therefore the intention of the author to write only of the design of a masonry dam, premising that the same principles and methods may be also used for retaining walls.

The two main points which it is practically necessary to consider in the design are as follows:

1. That, whether the reservoir be full or empty, the line of pressure shall fall within the "middle third" at any horizontal section.
2. That the maximum intensity of pressure shall not exceed a certain safe limit for the material employed.

It is equivalent to laying down a rule that no tension shall exist in any part of the masonry. Well built masonry of good materials will stand a considerable tension, but of a practically indeterminate amount, and it is therefore safest to assume that it will not stand any tension.

Imagine that a horizontal fissure forms on the water face of a masonry dam and below the water line, through tension being caused by the line of resistance falling outside the "middle third" at that horizontal section. Then it is clear that the water pressure will exert a lifting action on the masonry above the fissure, and this pressure, being an additional force to that allowed for in the design, will cause the center of resistance to move towards the outer face, since the resultant of the forces is no longer that of water thrust and weight of masonry, but is that due also to the lift of the water pressure in the fissure, and it is obvious that the action once begun must continue until the dam is completely destroyed above the weak section.

According to Prof. Unwin this was the immediate cause of the failure of the Bonzy dam in May, 1895. (See Cassier's Magazine, Nov., 1896.)

The effect of fissures in masonry of all kinds are especially disastrous in tropical climates, since the growth of vegetation is so rapid as to ensure the destruction of any work to the interior of which roots are allowed to penetrate, and all vegetation should therefore be carefully removed from any important masonry work.

The first thing to consider in the design is the weight of the masonry per unit of bulk. (In this article English feet and decimals will be used.)

Light weight of stone usually corresponds to poor quality, and, as has been stated before, the best quality procurable is none too good for tropical work. The weight also varies with the proportions of mortar and stone, good rubble masonry usually having not much more than one-third mortar to two-thirds stone. The average of numerous works built of good stone and lime mortar in India and elsewhere is about 165 pounds per cubic foot.

The next point to consider is the limiting pressure on the masonry. For this no definite figure can be given, as everything depends on the workmanship of the masons and supervisors on the works, and also on the mortar employed. A safe estimate with lime mortar of good and suitable quality is 15,480 pounds per cubic foot.

Although it would open up too wide a field to consider "materials" within the scope of such a paper as this, which deals purely with a method of "design," it may be desirable to warn people to keep a very careful watch on the character of any lime supplied to them, and to reject all that there is the least doubt about. In Spanish-American countries and others in which the labor is of a slovenly character, almost anything may be expected where there is a possibility of a slight saving of trouble

As an example, the author had once to build a loading for a water wheel, and was much surprised that the lime supplied, while being absolutely non-hydraulic, developed practically no heat on slaking. It was subsequently found that the lime burners (native contractors) had found that quicklime was unpleasant to the feet, and therefore they said they were in the habit of pouring water on it, to cool it, when drawing it from the kilns.

A preliminary of the actual design must also be the determination of the depth of water at times of maximum floods, over the crest, assuming that the dam is to act as its own waste weir, which in most cases is economical, for on this, added to the height of dam, will be based the pressure of water against the dam.

It is also necessary to determine the top thickness of the dam. Now this is dependent on practical considerations only, such as the necessity of allowing for a roadway across the dam and freedom from cracking due to the sun's heat, a thick crest being less affected than a thin one.

A formula for the top thickness, which is, however, not by any means tallying with all practical constructions, is $T = \sqrt{H} + 2$ where T = thickness in feet, H = height in feet.

Next as to the pressures produced on the masonry by the forces in operation.

It is obvious that the weight of the masonry above any horizontal joint may be assumed to act in the vertical line passing through the center of gravity, and it is also obvious that if this line passes through the center of figure of the joint, or midway between its faces, the weight will be uniformly distributed over the whole joint, assuming (a) that the masonry is uniformly elastic and (b) that the figure is rectangular, which is correct in the case of a horizontal joint in a vertical slice of a masonry dam.

NOTE.—The term "joint" requires explanation. It is a convenient supposition for the purpose of design that a vertical slice is divided into a number of separate parts by horizontal joints, but special care must be taken in the actual construction that nothing in the shape of true regular joints shall be allowed to exist in the masonry as a whole.

If, now, a horizontal pressure be exerted against either face, the resultant force will no longer intersect the joint at the same point, but will be moved towards the face farthest from the face at which the horizontal pressure acts, and the angle at which it intersects the joint will be such that its sine equals the weight of the masonry, or, in other words, the vertical component of the line of pressure (or resultant, often called the "line of resistance") is always constant and equal to the weight of masonry above the joint, and therefore the amount of deflection in feet measured on the joint from the vertical line of gravity is proportional to the amount of pressure exerted in a horizontal direction.

retaining wall that when subject to no horizontal pressure the line of resistance falls to the inside of the center of figure, and that when the designed pressure is applied the resultant cuts the base at the center of figure, the advantage being that the foundation or joint is subjected to a uniform load. To obtain such a result in a wall for retaining a bank of earth is easy by the simple expedient of inclining the wall against the load, but in the case of a dam for holding back water the result can only be attained practically by a very massive design, an example of which is seen in the Vyrnwy dam, Liverpool water works.

The position of the center of resistance relative to the center of figure of any horizontal joint can be readily calculated by adding to the deflection of the resultant (as found in the foregoing rule) the distance from the face at which the horizontal force is applied to the vertical line through the C. of G., and from the sum subtracting the half-width of the joint at that place. The distance so found multiplied into the weight of masonry above is the moment producing bending stresses at the joint, and this moment is exactly equal to the product of water thrust and height of center of pressure.

For the sake of simplicity, the side of the wall or dam at which the pressure is applied will be called the "inner" face.

In determining the pressures on any joint it must be remembered that there are two forces at work:

(a) A bending stress (considering a vertical slice of the dam as a beam), the maximum stress at the faces being given by the formula $F = \frac{6P.L.}{T_2}$ where P = thrust applied and L = lever arm at which the thrust acts, and T = thickness of wall at the joints and F = maximum stress.

NOTE.—It will be seen that this formula is merely a simplified form of that for beams, and which is $\frac{1}{6}BD^2F = W.L.$ where B = breadth, D = depth, of beam; F = maximum stress; W = weight, L = lever arm bending moment.

It will be understood that these stresses are compression on the outside and tension on the inside when the center of resistance falls outside the center of figure (C. of F. in this case obviously coincides with center of inertia) of the joint.

(b) A direct downward pressure due to the weight of the wall and the mean value of which $= \frac{P_1}{T}$ and where P_1 = the total weight of masonry above the joint.

The resultant stress at any point = the algebraical sum of the two forces. For example, if F = 5 tons and $\frac{P^1}{T} = 4$ tons, the resultant stress will be

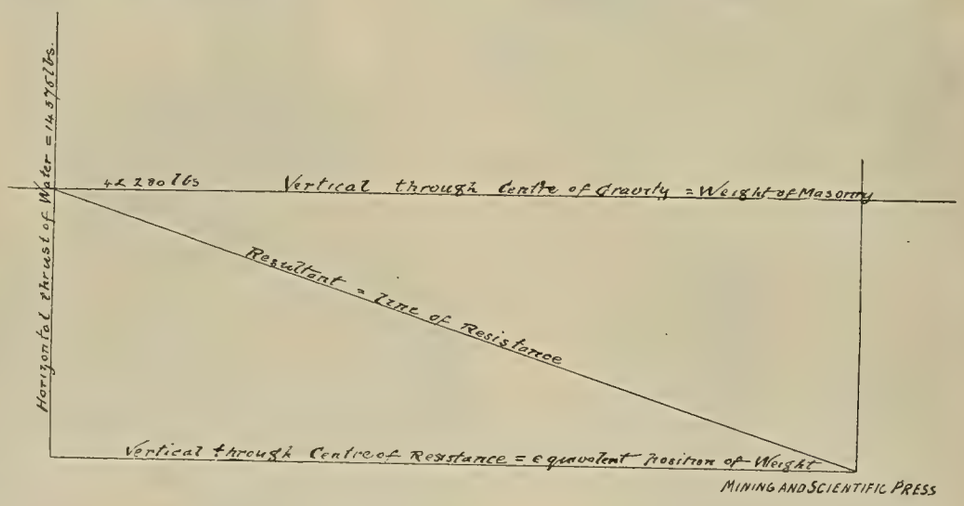


FIG 1 Scale — 80000 lbs - 1 inch

It will also be obvious, on reference to Fig. 1, that the tangent of the angle made by the resultant with the vertical $= \frac{\text{Horizontal force}}{\text{weight of masonry}}$, and also that the height of vertical line representing to scale the weight of masonry also represents the height of the center of pressure of water $= \left(\frac{\text{depth of water}}{3}\right)$ and that consequently the distance of deflection of the resultant measured on the joint from the line of C. of G. to the point at which the resultant intersects the joint which may be called the center of resistance is given by multiplying the horizontal water thrust into the height of the center of pressure $= \left(\frac{\text{depth of water}}{3}\right)$ and dividing by the weight acting through the C. of G.

Now, it is quite possible to so design a dam or

$5 + 4 = 9$ tons compression at the outer face and $5 - 4 = 1$ ton tension at the inner face.

As the method of design can be best illustrated by a concrete example, the author will now proceed with the design of a dam of the following dimensions: Height = 50 feet; thickness at top = N50 + 2 = 9 feet (assumed as a preliminary); weight of masonry (assumed) = 165 pounds per cubic foot; height of water over crest at maximum floods = 3 feet.

Now, the profile of such a dam can be calculated with more or less accuracy by rather elaborate formulæ, but the author purposes to show how it may be done with great simplicity and with sufficient accuracy for practical purposes by a trial and error system which has been actually used in the design of very important works, which have done their work satisfactorily for many years.

(TO BE CONTINUED.)

MINING SUMMARY.

ALASKA.

CAPE NOME.

(Special Correspondence.)—The experiment of hydraulic piping by C. D. Lane at Cape Nome will be interesting. He proposes to bring water under a head of 700 feet for hydraulic mining there. The extremely low temperature will necessitate a great velocity to prevent the water freezing in transit. The smaller the pipe the greater the friction, and without friction and velocity the water must necessarily congeal in the pipes. He has ordered $86,000 worth of steel-plate pipe from one San Francisco manufacturer.

Cape Nome, Jan. 10.

ARIZONA.

COCHISE COUNTY.

The Dos Cabezas Con. Mines Co. is putting new machinery on the mine. J. W. A. Off, of Los Angeles, is Pres.

There are thirty artesian wells in the St. David's district, above Benson, on the San Pedro river.

The Copper King of Arizona M. Co.'s smelter at Pearce will be put up and run by J. Williams.

GILA COUNTY.

Advices from Old Dominion mine state that a change in method of smelting is showing improvement in results. Only highest grade ores, running 10% to 13%, are being treated. At present oxide ores lower than 6% cannot be treated at a profit. With the sulphuret ores from the Continental mines, bought by the Old Dominion Co., added, the treatment of 3% ores will return a fair margin of profit.

Silver Belt: Messrs. Westmeyer and Andrus will begin the erection of a building for their ore sampling works at Globe as soon as the necessary lumber can be procured.

MOJAVE COUNTY.

W. H. Lake of Kingman will build a mill on the Colorado river for his mines this summer.

Miner: G. M. Bowers has purchased the interests of his partners in the Primrose, Todd Basin, and has men driving the tunnel ahead. Mr. Bowers will drive the tunnel 100 feet and sink a winze on the ore body. Machinery will be put on, as the mine is wet.

PIMA COUNTY.

The Gasman-Stratton group, in the Santa Catalinas, has been purchased by C. S. Condon, New York. G. E. Metz will be Gen. Mgr. and J. S. Scrivener Supt.

ARIZONA.

YAVAPAI COUNTY.

(Special Correspondence).—Prescott became the capital of the Territory of Arizona when it was created by Act of Congress in 1864, and continued to be such for many years, until the capital was removed to Tucson and subsequently to Phœnix. The lowest altitude of Yavapai county is 1200 feet, and it contains mountain ranges over 10,000 feet in height. It was to Yavapai that the first white settlers drifted from California in the early sixties, and located mines which have been worked more or less ever since. The advent of the Santa Fe, Prescott & Phœnix Railroad and the rise in the price of copper during the past two years have caused a revival in mining in Yavapai, like everywhere else in the Territory.

Prominent among the mining districts of this county is the Big Bug district, lying almost due east of Prescott, and which is reached by a short line of railroad which runs from Prescott to Mayers station, a distance of thirty miles. In the early days Big Bug was quite a producer of placer gold, which was superseded by quartz mining. The first quartz ledges were located in the early seventies and considerable activity was shown, the Christmas Gift producing in the neighborhood of $40,000 in gold. Owing to lack of transportation and the refractory character of the ores mining gradually died out until seven years ago, when a new era began, which has gradually improved until now it is estimated that 150 men are employed in the district.

The Poland mine, three miles from Providence, the postoffice of Big Bug district, is owned and being systematically developed by the Congress Gold Co. Nearly 6000 feet of development work has been done in the upper workings, and a tunnel is now being driven through the mountain to Lynx creek, a distance of 6000 feet; 125 feet have yet to be driven to reach a point where an upraise will be made to connect with the upper workings. No ore is being shipped. Within a few hundred yards of Providence is the Belcher mine, one of the oldest in the district, which was worked twenty-five years ago, when soldiers were obliged to guard the property from the attacks of Indians. A gasoline hoist is being put in. Adjoining the Belcher is the Red Rock mine, owned by Californians, upon which a 40-ton steam stamp mill is reducing the ore. East of Providence is the Sterling, being developed by Ohio capital. Across the gulch is the Lottie, in which Jamestown, N. Y., capital is interested. All of these properties are paying.

Between Providence and Mayers is situated the Henrietta mine and a 20-stamp mill, ten stamps of which are running day and night. This property is under bond to Eastern parties. Near by is the Commercial smelter, as it has for a long time been known. It was erected ten years ago and has treated the gold, copper and silver ores of the district. It is at present the property of Phelps, Dodge & Co. of New York, but has been leased to the Arizona, Eastern & Montana Co., who have repaired the plant and who, within a few weeks, will be in readiness to treat ores as heretofore. A new furnace is contemplated.

Two miles across the hill is the town of McCabe. The McCabe mine has the deepest shaft in the district—700 feet. Sixty men are employed on this mine. At present fifteen carloads of ore are shipped per month to the Silver City smelter at a cost of $6 per ton for railway transportation.

Within a mile of the McCabe mine is the Dividend M. & M. Co., composed of Los Angelenos, who have opened up an ore body. Near by is the Little Jessie, an old property taking on new life. North of Huron station is the Lone Pine mine, which has produced $30,000 since Nov. 1st, '99, and which was bonded to H. B. Clifford & Co. of New York, who have transferred their bond to a syndicate for $85,000. All of the payments have been made except the last, which it is said has been anticipated and is now on the way to Geo. Rohpeter, the owner.

Four miles below Huron station, with a sidetrack of a mile, is the Val Verde smelter, owned by Boston and English capitalists, under the management of Cecil G. Fennell. This plant has a capacity of 200 tons per day and has been constructed during the past five months, the machinery having been put in by the Colorado Iron Works of Denver. It is admirably situated on the Agua Fria river and has unlimited water. It is equipped with automatic dumping appliances and labor-saving machinery, and has bins capable of holding 1000 tons of ore. A number of good buildings have been erected upon this company's property and they expect to open up for custom smelting within the next few weeks. This company also owns a group of copper prospects in the Grand Canyon of the Colorado, fifty miles from Williams, from which they expect to obtain much of their ore.

What Yavapai county needs most is a pyritic smelter similar to the one in Silver City, New Mexico, to handle the rebellious ores with which this county and Mohave county are filled, and which are being successfully treated at Silver City. The Val Verde people are contemplating the construction of such a furnace, and if they do it will prove a profitable investment to them as well as a boon to the miners of this vicinity. Twenty miles from Mayers station is the Crown King mine, which has been a large producer for years. A few men are working there. The mill is shut down owing to litigation, which has handicapped this property for years.

At Mayers station—named after Joe Mayers, who has been located here for the past seventeen years—is the largest onyx bed in the world. Hundreds of tons of onyx have been shipped to Chicago, New York and Kansas City. Prof. Morril of the Smithsonian Institute at Washington has examined this property and says it has no superior on the continent. It was sold five years ago to a New York company and the superintendent is expected to arrive here in a few days to arrange about working it. Four miles from Mayers is situated the Blue Belle copper mine, owned by Senator Addicks of Delaware. It is reported that this mine has a body of 47 feet of ore running from 6% to 8% copper and containing streaks of gold assaying $4 per ton. Extensive reduction works are contemplated on this property.

Prescott, Feb. 13.

(Special Correspondence).—The Grand Gulch mine, seventy-five miles south of St. George, Utah, belonging to Jennings Bros. of Salt Lake City, is shipping a carload a week of high-grade copper ore, which is hauled about 150 miles to the Oregon Short Line Railway.

The Savanic, four miles from the Grand Gulch, recently struck a good grade of copper, having shipped one car.

St. George, Feb. 6.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—The Standard Electric Co., whose power house on the North Fork of the Mokelumne river near Mokelumne Hill was recently destroyed by fire, will abandon its old ditch and build a new one twenty miles long, capable of carrying 10,000 miners' inches of water, conveyed to a power house three miles above the site of the burned works. Here a vertical fall of 1400 feet will be obtained, capable of generating 15,000 H. P. Besides the new ditch, an "insurance reservoir" will be built at the head of the ditch capable of holding sufficient water to run the works for at least sixteen days in case of accident at the head gate in the river. A road has been graded to the new power station, and 500 men will be put to work on the ditch line and reservoir. C. H. Elison is superintending affairs.

Jackson, Feb. 14.

BUTTE COUNTY.

The Cherokee Flat hydraulic mine, comprising 160 miles of water ditches, 30 miles of debris canals and 1500 acres of patent channels, has been sold to a syndicate of Pittsburg and Washington men for $250,000. The mine is above Oroville.

CALAVERAS COUNTY.

(Special Correspondence).—The quartz crystals brought to the surface at Mokelumne Hill have attracted wide attention and there is a future for the industry of gathering these remarkable specimens. The crystals are found in the Green Mountain gravel mine, two miles south of Mokelumne Hill. They had been taken out by the early workers in this mine and thrown aside as valueless. The matter was brought to the attention of J. E. Burton of Wisconsin. He was impressed with the value of the crystals and conferred with Tiffany & Co., jewelers of New York, relative to their use in the business of that firm. He was assured that large quartz crystals were rare and valuable. Mr. Burton bought the Green Mountain mine, chiefly for its value in crystals, put men to work; took out of the mine several tons of the crystals and shipped them to Tiffany & Co., who were employed, for 20% of the price realized, to cut them into such forms as would make them most salable. Tiffany & Co. have in the main turned them into balls. The collection is still unsold and is valued by experts at $17,000. One of the largest of the balls is 7½ inches in diameter but is not entirely flawless; another, 5½ inches in diameter, has no flaw, and this one is valued at $3000. The collection is to be taken to the Paris Exposition and there made a prominent part of the Tiffany display. It is expected that numbers of these crystal balls, which are like distilled water petrified, will attract much attention, arranged upon a piece of petrified ebony also in the Tiffany display. It is more than probable that the crystals will find purchasers at high figures during the Exposition. If so, and if the sale of other specimens at largely remunerative prices is assured, Mr. Burton will resume the work of taking them out of the Green Mountain mine. At present the mine is being worked as a hydraulic proposition at another point of the channel, and, as such, the enterprise is paying well.

G. F. King, of the U. S. Geological Survey, and also the expert for Tiffany & Co., devotes a chapter in his last Government report on precious stones to a description of these California crystals. He goes on to say that "the specimens are found in the compacted filling of one of the old river channels that are so marked a feature of California geology. They are described as lying in every sort of position in the old filling. Some are close to the rim rock, or ancient river bed, embedded in coarse colored gravel and cement, stained and discolored externally, but in some cases clear and brilliant within. Over the rim rock is a cream-colored clay, and then a coarse, wet sand, much compacted, in which are found clean, handsome-looking crystals, though all are muddy and require thorough washing. Two stopes or drifts have been run into this deposit for several yards, and the sides, faces and roofs are seen to be full of crystals." Mr. Kunz also says: "This is an interesting and promising addition to American minerals, available in the ornamental arts, as hitherto only occasional pieces of rock crystal possessing sufficient size and transparency to serve for such purpose have been found in the United States. Japan, Brazil, Madagascar and the Alps have hitherto been almost the only sources. It will be an interesting geological problem to ascertain the origin of these grand crystals now strewn in the old channel. As they are not much rolled and lie so thickly in a limited space, it seems that they can not be far removed from their point of ocrence, and the suggestion arises that some cavern or open vein lined with the crystals has been cut through by the ancient stream, and perhaps entirely obliterated, near the spot where they are now found."

(Special Correspondence).—The Utica M. Co. has its electric power house near the town of Murphys. The company has power in reserve. Water is taken from the company's ditch with a perpendicular fall at the power station of 580 feet. At present there is but one 48-inch Pelton wheel, which runs a single K. W. generator, capable of yielding 1000 H. P. A second generator is to be put in. The supply of water to the wheel is regulated by an electric governor, maintaining uniform speed of 400 revolutions per minute. Since the machinery started, Nov. 10th, '99, there has been no stoppage on account of accident or for repairs. The company furnishes power and light to several enterprises. It transmits energy to Jackson, Amador county, fifty miles from the power house.

Work goes on at the Sheep Ranch mine, which is being reopened by a new company, whose stockholders are mainly San Francisco business men. The mine had filled with water within 100 feet of the collar of the shaft, from which it was drained off by a tunnel. The work of unwatering was done with the hoist, which began baling last August. About 35,000,000 gallons of water were taken out, when men began to retimber to the 300-foot level. At present buckets are used to hoist ore, etc., but it is proposed to lay T-rails in the shaft and thereafter to use skips. The shaft is 1200 feet deep. Ore is being taken from the 1100-foot level. There is a new 20-stamp mill, run by steam. An old ore dump is being put through the mill. The ore does not furnish much value in sulphurets, and no ore concentrators have been procured, though there is a place for them in the new mill; they will be added later. Besides the large double steam hoist, there are stationed here two vertical air compressors. Everything is run by steam; wood costs $4 to $5 per cord; no water power is available. The company runs a 180-light dynamo, supplying electric lights for its own use and for the town of Sheep Ranch. The plant will ultimately include a pump, as the mine makes considerable water. V. S. Garbarini is Supt., J. T. Langford Asst. Supt. and accountant, Louis Bohnes mine foreman.

Lewis Emery, near Mountain Ranch, ten miles west of San Andreas, owns for two miles along an ancient river channel and has invested several thousand dollars in preliminary operations. He has built three miles of ditch and laid a 30-inch steel pipe line 6400 feet to a point where it branches into two 16-inch lines, one of these lines going 4000 feet south to the Motto claim, the other 1½ miles northwest to the Rose Hill claim. At the former he gets a vertical fall of 400 feet; at the latter, 285 feet. Mr. Emery works under permit of the Debris Commission, and thoroughly impounds the tailings on his own ground. Two No. 6 Little Giants will play against the bank at the Motto claim, where bedrock tunnels, etc., have been constructed. Last year 30,000 cubic yards of earth were moved at the Rose Hill claim with good results.

There are several other gravel properties in the same portion of the county which might be profitably worked if water was available.

The gravel claims near Mokelumne Hill are attracting some attention. The Green Mountain mine, at Chile gulch, is working along in a modest way under the management of J. E. Burton, who represents Milwaukee, Wis., men. Here the supply of water is 500 inches, discharged through a monitor under pressure of 270 feet, vertical. He is also developing the Comanche gravel claim, in the Mokelumne Hill district.

The North Star gravel mine, owned by P. L. Shuman and Gustav Baumann, and under the superintendency of Ed Baumann, is another leading gravel proposition in this district. The owners control two miles of channel. From results obtained through tunnels run into the auriferous gravel, it is considered to be a good property.

At the Ellen Vannon drift mine, near the North Star, a tunnel has been run 400 feet, where gold-bearing gravel has been obtained. The gravel is run through an 8-stamp mill, and in a recent working 110 tons yielded $540. The twelve men employed are mainly prosecuting development work. The mill is run by water power, under 160-foot pressure, a 2-foot Pelton wheel being used. The gold from the gravel is caught almost entirely upon two tables, each 4 feet wide, 12 feet long, set below the batteries and corresponding to the plates in a quartz mill. Six trenches, 2 inches deep, extend transversely across these tables, in which quicksilver is placed. Nearly all of the gold is caught in the first three trenches. W. J. Jackson is Supt. and part owner of the Ellen Vannon, with English associates.

Besides the gravel properties which J. E. Burton is developing in the vicinity of Mokelumne Hill, in a quartz claim at French Hill is being driven a tunnel to tap numerous veins; it is now in 350 feet. T. E. McSorley is Supt.

The Foote & Thompson, or Quartz Glen mine, five miles east of Mokelumne Hill, is

a property likely to be heard from. Chicago men have a bond on the mine. At least $300,000 were taken out of this mine in former years. There are two well-timbered tunnels running in on the ledge, aggregate length 2000 feet. The upper tunnel gives 240 feet of backs, the lower 700 feet. Very little stoping has been done. There is a 20-stamp mill on the property, which can be run by water under 700 feet pressure from a pipe line.

J. K. Carpenter, representing Eastern men, has been examining mining properties near Mokelumne Hill. His method is different from most operators. Instead of bonding claims, he buys outright for cash. He recently bought the Cramer mine.

At the Calaveras, formerly known as the Lucas mine, on the river near Mokelumne Hill, ore is taken from a tunnel and carried in cars by mule power to a 10-stamp mill on the opposite, or Amador, side of the Mokelumne river, the stream being spanned by a bridge suspended from wire cables. Hoisting works are about completed on the hillside above the tunnel and a shaft is being sunk.

Power is furnished through turbine wheels under 15 feet fall, the water being taken from the river a short distance above. One 30-inch wheel runs the stamps and another about the same size will run the air compressor, from which air will be conveyed 1400 feet through a pipe line to the mine. Twenty-two men are employed at the Calaveras; P. Houghton is Supt., E. M. Houghton foreman.

At the Ford mine, near San Andreas, the mill will soon start up. Here the hoist and air compressor are run by steam, the mill by electricity from the Standard Co. W. Knight is Supt.; L. Guerne is Sec'y and assayer. The stockholders are mainly New York people.

The Fellowcraft or Veritas mine, adjoining the Ford, is to be started again by a new company. J. M. Lively of San Francisco, who represents Eastern stockholders, is getting matters in shape to pay off old liens and to start with a clean score. Local faith in this mine is very strong. There is a good 10-stamp mill on the property, a good hoist and the shaft is 200 feet deep.

An excellent showing has been made at the Commodore mine, one and one-fourth miles northwest of San Andreas. Work began Aug. 1, '99. The shaft, which follows the foot wall at an angle of 75°, is now down 300 feet. At the 200 level a crosscut showed the ledge to be 8 to 10 feet wide; at 300 feet it is 17 feet wide. There is a 60-foot drift at the 200 level and a 50-foot drift at the 300 level. Within a few months the present steam hoist will be replaced by a larger one and a 20-stamp mill built to be run, without doubt, by electric power. W. H. Clary, Jr., is Supt.

W. B. Swank is opening up the old Oro Fino mine, now called the Pilot, located near Cave City, ten miles east of San Andreas. He is building a 4-stamp mill, which will be run by water brought through a ditch two miles long from McKinney's creek. He will get a pressure of 100 feet, and expects to crush twelve tons per day with his four 900-pound stamps.

The Gwin mine, the last property visited in Calaveras county, is one of the famous mines on the mother lode, and has been often described. The vertical shaft is 1656 feet deep. The old incline shaft is 1450 feet, the two shafts being connected at the 1400-foot level. The 80-stamp mill has space reserved for twenty additional stamps. There are thirty-two concentrators. The sulphurets are shipped. Water is the motive power, and there is a vertical fall at the wheel of 400 feet. The air compressors are one mile down the creek, where there is a pressure of 200 pounds to the square inch, the water being used after doing duty at the mill. The 16-foot wheel acts directly upon the air compressors, being hung on the main shaft. Nearly 200 men are employed at the Gwin.

The Melones G. M. Co. holds a special meeting March 7th to take action on a proposition to increase the capital stock by an issue of 35,000 shares of preferred stock to $2,350,000, the new stock to be entitled to 12% dividends and to be disposed of at not less than par—$10 per share.

San Andreas, Feb. 10.

Citizen: In the Commodore mine, Supt. Clary has cut through the ledge, after drifting along it for 125 feet, and, after crosscutting from the 300-foot level, found the ledge to be 26 feet wide, assays being satisfactory to the management. Drifting on the vein has been resumed. These explorations are made with the view of testing quality and quantity of the ore, and will be the guide in the size and character of the mill to be erected during the spring.

EL DORADO COUNTY.

Gazette: The Esperanza mine, Garden Valley district, is about to resume operations, with Robert Harrop as Supt.

FRESNO COUNTY.

A railroad from Fresno to King's River canyon is projected by the Copper Mountain M. & D. Co. There is a proposition to bond the mines for $500,000 and develop them, in which case a railroad about sixty-five miles in length would be built from the mines to Fresno.

INYO COUNTY.

Register: The Bradford rotary mill is in full operation at Borin, in the Slate range.

KERN COUNTY.

Reporter: J. B. Treadwell will build a 4-inch pipe line four miles long, to conduct water to the river oil district and connect with distributing tanks.

SAN DIEGO COUNTY.

The annual stockholders' meeting of the American Girl M. Co. at Yuma elected H. H. Markham president and F. S. Daggett treasurer.

The discovery of mica near Tacumba, on the edge of the Colorado desert, is reported. The ledge is said to be 30 feet wide.

SISKIYOU COUNTY.

The new mining dredger at Hawkinsville has been launched and will be ready to work in June.

Journal: The Greenhorn Blue Gravel No. 2 Co. has bought the Nehrbass place for $2900 and will start work April 1st.——The hydraulic mines of Oro Fino are being worked energetically.——L. T. Williams has bonded his mine on Humbug.——A force of ten men are prospecting the Schroeder mine, on Deadwood, with the intention of commencing operations on an extensive scale. The new owners have expended $100,000 in development.

News: At the Sheba mine, Patterson creek, a 500-foot shaft will be sunk.

TUOLUMNE COUNTY.

(Special Correspondence).—It was the impression for several years that Tuolumne county was a pocket mining region, but in the past three years many old mines in the east belt have been reopened with promise of permanence and value,

Confidence, six miles north of Soulsbyville, has been almost entirely rebuilt, and is the result of reopening the old Confidence and other mines in that neighborhood.

Arrastraville and Cherokee, three miles east of Soulsbyville, have doubled in population in the past two years, the result of opening mines. Carters has doubled in size the past year. There are several mines being opened near there; it is also the terminus of the Sierra railroad. At the Big Oak mine, in the Soulsbyville mining district, the 30-stamp mill is running steadily. The sulphurets are shipped to the Selby Works in San Francisco. With the cyanide plant 95% of the gold is saved. The above company owns the Live Oak and Carra mines on the south, and have lately made several payments on the Lander Ranch and Jumbo mines on the north.

The South Extension Black Oak mine, owned by J. D. Sullivan & Co., has been opened by a tunnel. A winze is being sunk from the tunnel; the vein is of good size. Mr. Sullivan says machinery will be placed on the mine and sinking continued.

The pump was recently lost at the Draper mine, and the shaft, which is 300 feet deep, may be retimbered. Steam power is used on this mine. This vein is in the granite and near the Black Oak. About $1,500,000 in gold was taken out when worked years ago.

T. Pickle, who had the Trevithick under bond, forfeited it to the owners, who have begun work and have opened a 2-foot vein of ore.

Soulsbyville, Feb. 12.

New Era: Ten stamps will be added to the Longfellow mine mill. A cyanide plant will also be placed thereat. The mine is under the superintendency of T. F. Coyle.

COLORADO.

BOULDER COUNTY.

The option at sixty days asked for by a Boston syndicate on the Big Five at Ward, for $3,000,000, was last week denied. The extension of time applied for was also denied.

CLEAR CREEK COUNTY.

Georgetown proposes organizing a home pool to work the idle silver mines in that locality. The idea has been carried on in Gilpin county for a good many years, and has worked well.

EL PASO COUNTY.

Record: A great deal of development is being done on the Clyde claim, adjoining the Modoc and Last Dollar on Battle mountain.——Michigan men, represented here by L. H. Johnson, have secured a fifteen months' lease on the south end of the Kentucky Belle. They will commence work at once.——A. E. Stevens has been appointed Mgr. of the Golden Hub and Chesapeake & Cripple Creek companies.

GILPIN COUNTY.

Henry Bolthoff, of Denver, will put one of his improved hoists on his mine, the Mechanics' Lode.

One or more new concentrators may be built at Central City.

The Whitcomb stamp mill in Nevadaville was recently burned. The property is owned by the Vendome Co. Loss about $5000.

Register-Call: A new office and assay office have been erected at the Crown Point & Virginia mine for the California & Colorado M. Co.——A whim has been placed on the Colfax mine by the Bertha M. & M. Co.

LAKE COUNTY.

Among the gold belt properties that are gaining in prominence are the Fortune and Penfield group bought by L. C. Ferree of Denver.

The Home Mining Co., of Leadville, has secured extensions of its leases for ten years. The mines are now outputting 350 to 400 tons a day, netting $4 per ton.

OURAY COUNTY.

The building of a smelter for the Saratoga group at Red mountain is now an assured fact.

W. C. Wrisberg of the American G. M. Co. says at the American-Nettie work on the proposed improvements will be commenced immediately. The new mill will be a 20-stamp mill with room for ten additional stamps.

SAN JUAN COUNTY.

C. C. Pierce, of Indianapolis, will make test shipments from his mine in Burrows Park district, and will erect a mill at Eureka. R. L. Ray, Lake City, is Mgr.

The Saratoga Mine Co. will build a smelter this year. L. E. Fry has charge of the company's properties.

TELLER COUNTY.

St. Louis, Mo., men have bought the Brown Leghorn, Monarch, North Star and Silver State claims, comprising thirty acres of territory on Globe hill, for $140,000.

IDAHO.

BOISE COUNTY.

The Iowa group of mines at Quartzburg has been sold by D. Coughanour for $10,000 to Boston men, who will begin work next month.

ELMORE COUNTY.

The Pennsylvania Placer Co. at Pine Grove has spent nearly $10,000 in development. This company owns 5200 acres of land, 2000 acres of which is channel gravel from 60 to 90 feet in depth. Tests so far give a value of 30 cents per cubic yard.

IDAHO COUNTY.

(Special Correspondence).—The Midas G. M. Co. of Spokane, Wash., principal stockholders Campbell and Finch, have reached a depth of 115 feet on their Ajax claim, and another crosscut will be made and drifts started east and west. The shaft is in free milling gold ore and a crosscut at 60 feet below collar of shaft showed 18 feet width, carrying values for entire width. The ore is soft and oxidized, and can be mined and milled for $2.50 per ton, according to manager's statement. The company will erect a large mill and hoisting works on the property at once. Dixie is twenty-seven miles southeast of Elk City, and eighty-two miles from Stuart, which latter place will soon be the terminus of the M. R. Ry., Clearwater extension. It is on the south slope of Salmon River mountains, about three miles from the summit of watershed between the Salmon and Clearwater rivers. The general formation of the district is archean granite, with porphyry and diorite dykes. The camp lies at an altitude of 5300 feet above sea level, is well timbered and watered.

The richest ore ever found in Idaho has been uncovered about one and a half miles northeast of Elk City. The claim is on the west side of American river and is parallel to the Blue Dragon and Red Stone leads. The vein has been crosscut at a number of places for a distance of 200 feet and in all shows high grade, free milling gold ore. In one hole, 6 feet in depth, is exposed 12 inches of quartz that is literally one-half gold. Out of this shaft the owner has sacked over a ton of ore. It is estimated that all of this is worth $10,000 per ton. The owner has at various times pounded out from three to eight ounces of gold in a hand mortar in half an hour. The owner is driving a drift to cut the vein deeper.

The Hillside group of claims on Big creek, adjoining the Gold Bug, is under bond to a Chicago firm, and development work will be started at once in charge of E. F. Gordon, one of the owners.

Grangeville, Feb. 15.

The bunk and store houses of the Buffalo Hump Syndicate were destroyed by fire, with a 10-stamp mill and sawmill stored therein. Loss, $15,000.

SHOSHONE COUNTY.

A bond on the Paymaster, Lost Wonder and Clear Grit claims has been secured by J. Porter of Spokane; consideration, $40,000.

WASHINGTON COUNTY.

At the Decorah mine, in the Seven Devils, Mgr. Hancock is using a diamond drill.

MONTANA.

DEER LODGE COUNTY.

Engineers have been examining the Madisonian group for Montreal men.

MADISON COUNTY.

E. L. Shafner has made an examination of the properties of the Lake Shore M. Co., near Sheridan, and says that the company will erect a 20-stamp mill at the mine in the spring.

Inter Mountain: F. Harrington and other Butte men have bonded the Majestic group of mines near Pony and are developing. They will erect a mill in the spring.

SILVER BOW COUNTY.

The Boston & Montana mine claims to have ore in sight, blocked out, exceeding 2,000,000 tons.

NEVADA.

ELKO COUNTY.

(Special Correspondence).—The Dexter G. M. Co. milled 30,033 tons of ore in 1899 by stamps and amalgamation and treated 19,100 tons of mill tailings by cyanide, the proceeds from all amounting to $188,900, with an expense account of $120,000. The mill has forty stamps. The ores come from 50 to 250 feet in depth.

Tuscarora, Feb. 5.

The management of the Tuscarora Chief, at Tuscarora, has decided to resume work.

HUMBOLDT COUNTY.

R. J. Lang, Supt. Rabbit Hole sulphur mines, near Humboldt House, says that his company is taking out eight tons of sulphur daily.

LINCOLN COUNTY.

(Special Correspondence).—A. W. McCune, of Salt Lake City, is preparing to erect a cyanide reduction plant, at Deer Lodge, in the State Line district.

State Line, Feb. 7.

NEW MEXICO.

BERNALILLO COUNTY.

New Mexican: The Victor group, owned by a syndicate of Santa Fe Railroad Co. conductors, has been bonded to W. J. Cartan. M. J. Sherlock has bonded to J. C. Flournoy five of his mining claims.

GRANT COUNTY.

The Pinos Altos G. M. Co. is increasing its mine force in order to supply its new mill with ore. B. B. Thayer is Mgr.

LINCOLN COUNTY.

New Mexican: New York men have bought the Boston Boy, north of the Old Abe, at White Oaks, and are negotiating for the purchase of the South Homestake mill.

RIO ARRABA COUNTY.

J. K. Turner, one of the early cyanide workers in the West, is Mgr. for the Copper Hill M. Co. at Renconda.

SANTA FE COUNTY.

J. W. Fleming, mine inspector for this territory, has completed a tour of the coal mines in New Mexico, and in his opinion the output this year will be greater than last.

OREGON.

BAKER COUNTY.

E. J. Godfrey, of the Red Boy mine, says it is intended to sink the shaft 2500 feet.

The Sumpter Con. G. M. Co. has incorporated; R. Koerner, T. I. Richards, O. S. Olson; capital stock, $100,000.

A new strike has been made in the Golconda mine at the 200-foot level. The monthly payroll is $8000. J. G. & J. T. English are owners. Geo. Robinson is millman.

JACKSON COUNTY.

The Montreal & Oregon M. Co., which recently bought the Ashland group of claims for $125,000, contemplates the building of a 10-stamp mill when the lower tunnel and the west shaft on the 250-foot level meet. C. D. McDonald, Ashland, is Supt.

JOSEPHINE COUNTY.

J. B. Scott, who bonded the Messenger mine, is having ore tested preliminary to building a mill.

The Chicago men who bought the Old Channel mine, on Six-mile creek, and connected it with the Illinois river by ditch, have started piping with one giant.

SOUTH DAKOTA.

LAWRENCE COUNTY.

J. H. Ahern, Sec. Hardin M. Co. and Chicago & Two Bit M. Co., has been in Deadwood inspecting the company's property.

In the mining district embracing Cen-

tral City, Black Tail and Garden City, there are five mills equipped with modern cyanide plants to treat refractory tailings.

Review: The Esmeralda mine, in Blacktail, has been sold to a Boston company, which will enlarge the mill and increase development.

PENNINGTON COUNTY.

On Rapid creek the Copper Cliff Co. has bonded a group of claims and begun extensive development. Mr. Florhman is Gen. Mgr.

UTAH.

The report comes in of alleged tin discoveries in the Uintah mountains, in the northeast corner of the State.

BEAVER COUNTY.

(Special Correspondence).—The Copper Mountain Copper Co. has a 200-foot shaft, from which drifting has been done on the ore body. This is strictly a copper proposition, and Lessee C. H. Smith reports that he will make a shipment this week. It is believed the ore will average 10% copper. Dr. M. N. Buck of Salt Lake City owns the majority of the stock.

Frisco, Feb. 3.

BOX ELDER COUNTY.

(Special Correspondence).—The old Ashbrooke mine recently put in steam hoisting and pumping equipment. The shaft will be sunk deeper and other development prosecuted. The property belongs to the Salt Lake Mining & Improvement Co, of Salt Lake City.

Bingham, Feb. 8.

JUAB COUNTY.

(Special Correspondence). — The Sunbeam, one of the first locations in the Tintic district, is making small weekly shipments. Mgr. A. Buckbee states that development work and sinking proceed on a larger scale this year. The property is on a well-known ledge of the eruptive porphyry section, which is traceable 4000 feet. It is believed some big mine will yet be opened on this ledge and there are numerous locations. Ore of the value of $60,000 was shipped from the Sunbeam last year. It ran about 10% copper, thirty to fifty ounces silver and small values gold.

Eureka, Feb. 10.

(Special Correspondence).—The Bullion-Beck mill is to be remodeled and provided with new equipment of a character that best befits the process required.

Eureka, Feb. 14.

Republican: Work has been resumed on the Snowflake property under the management of W. Hatfield.

PIUTE COUNTY.

(Special Correspondence). — The Annie Laurie of the Bald Mountain M. & M. Co., fourteen miles from Marysvale, is working with a force of thirty men and making some shipments of ore. This property is bonded to a Pennsylvania party, the amount named being $310,000, and the time limit May 1.

Marysvale, Feb. 13.

SALT LAKE COUNTY.

(Special Correspondence).—The Columbia Copper M. Co. are running three drifts from the main crosscut tunnel, on their property in Bingham canyon. One drift, at right angles to the tunnel, goes in 400 feet. About twenty tons per day are being milled at the Rogers mill, which concentrates fifteen tons to one ton. The ores run about 2% copper and the concentrates 24% copper, $3 gold and silver and 15% iron excess. The ores carry about 85% silica, which is pretty thoroughly elimininated by the concentrators. The property is owned by five stockholders, F. B. Cook being Mgr. WASCOTT.

Bingham, Feb. 9.

(Special Correspondence).—The Fortune M. & M. Co. have nearly completed their 100-ton concentration mill near Bingham. It is being equipped with crushers, rolls and concentrators and will doubtless be operating in a few weeks. The ores in the Fortune are copper and lead sulphides, with good values in gold and silver.

Bingham, Feb. 12.

At 270 feet depth the West Mountain placer encountered bedrock. Pannings show a plentiful presence of nuggets, some as large as wheat kernels.

SUMMIT COUNTY.

(Special Correspondence).—The Silver King paid a dividend of $75,000 on the 10th inst., and is said to have rich ore reserves of such dimensions as to assure continuous profits.

Park City, Feb. 12.

TOOELE COUNTY.

(Special Correspondence).—The Bunker Hill mine, near Stockton, has a shaft 250 feet deep and has produced about 700 tons of silver-lead ore, which ran high.

The Lion Con. mine paid off $6500 as a balance due on the bond Jan. 1st, and are now proceeding to erect buildings and put in hoisting machinery, preparatory to sinking a new shaft. Present workings are by means of an incline 500 feet long. The plans are to erect a concentration mill.

Stockton, Feb. 9.

(Special Correspondence).—The Chloride Point mill at Mercur is treating from twenty-five to thirty tons of ore per day, the average values extracted being from $13 to $14 per ton. The process is so regulated as to use only about one pound of cyanide to the ton of ore. These ores carry good silver values, as well as gold, and they are extracting about 70% of the silver values and practically all the gold. The good results attained are due to the efforts and skill of M. D. Stackpole, Supt., and Prof. Wm. Orr, agent of the MacArthur-Forrest process.

Mercur, Feb. 13.

(Special Correspondence).—The Overland cyanide plant will doubtless be enlarged this year. Mgr. Duncan has been East to arrange for this project with the principal stockholders.

Sunshine, Feb. 14.

(Special Correspondence).—The Honorine mine, near Stockton, is being started again under the directions of Scheu & Kimberly. A new compressor is being put in, to be used in pumping. The water will be taken from the shaft that sinks from the tunnel. Later a hoist will be set to work underground. E. J. Raddatz is superintending the work.

WASHINGTON COUNTY.

(Special Correspondence). — The Dixie copper mine, near St. George, is reported sold to St. Louis and New York parties for $220,000, B. T. Lloyd, of Salt Lake City, having negotiated the sale. The property will be further developed. A small smelting plant goes with the property, which is said to have produced $300,000 worth of copper.

St. George, Feb. 14.

WASHINGTON.

FERRY COUNTY.

The management of the Merrimac announces that a hoisting plant is to be placed on the property.

After various long continued experiments, the Republic Co. is satisfied that the ore must first be roasted and then leached.

FOREIGN.

BRITISH COLUMBIA.

Rossland reports the discharge of 100 men by the Le Roi M. Co., and the announcement comes from Nelson that the Hall mines and smelter had also shut down, on account of enforcement of the eight-hour law for underground mining. Following so quickly after the partial shut-down of the War Eagle and Center Star, these further cases of cessation of mining operations have created dismay in both mining and business circles. Unfortunately, too, there is said to be a probability of still other instances of wholesale discharges and shuttings-down before the middle of the present month.

The Bosun, in the Slocan, has closed down and Mgr. Sandiford will go to England to remain until the labor difficulties reach a settlement.

The second payment of 10% of the $30,000 bond on the Hartney, on Silver mountain, near New Denver, has been made. Rochester, N. Y., men are developing the mine.

MEXICO.

Oasis: All property of La Compania Union Minera is sold to C. A. Meeker and associates of Kansas City and St. Joe, Mo., for $120,000, American money.

Industrial Notes.

—Arizona is sending cavalry horses to South Africa.

—The extensive use of zinc shingles in the United States seems probable.

—Baker City, Or., has voted $100,000 bonds for a gravity water system.

—The Colorado Midland Railway has a snow plow weighing 144,500 pounds. It cuts a swath 14 feet wide.

—Salt Lake City, Utah, is going to buy two miles of water pipe, 30 to 36 inches diameter, for use in a new gravity supply main.

—Atchison, Kansas, is about to drill for coal. It is thought commercial veins of coal underlie the section at 600 to 1000 feet depth.

—The date set for the first operation of electric passenger and freight cars between Seattle and Tacoma, Wash., is Aug. 1, 1900.

—The Canyon City extension of the Florence & Cripple Creek Railway is in connection with the Denver & Rio Grande at the former point.

—Deputy Consul-General Hardy writes from Mexico that land suited to the growth of rubber can be had anywhere from $1 to $15 per acre. The titles are vested in private ownership.

—Pueblo, Colo., smelters are handling considerable Mexican lead ore. The U. S. Government gets no revenue from these importations of lead, for the ore is treated in bond and then shipped out of the country.

—Los Angeles, Cal., reports probability of another transcontinental railroad, from Mojave east by north through southern Nevada into Utah, the builders to be the Santa Fe, Southern Pacific, Rio Grande Western and Union Pacific. The Carson & Colorado line is designated as the link for the proposed new route.

Personal.

THOS. COUCH of Montana is in California.

SAMUEL NEWHOUSE returns to Salt Lake soon.

WM. ORR has returned to Salt Lake City from California.

W. E. MORROW is the new Supt. Yak tunnel, Leadville, Colo.

PRES. DERN of the Mercur, Utah, M. Co. has gone to Europe.

E. MCCARRICK is new Mgr. Plymouth Rock Co. in Tintic, Utah.

J. W. NEILL of Salt Lake City, Utah, has returned from Boston.

J. C. JENS has returned from Mariposa Co., Cal., to San Francisco.

GEO. E. BATEMAN is Supt. Black Spider mine, near Keswick, Cal.

R. G. LEGG is Mgr. Dexter M. Co.'s mine and mill at Tuscarora, Nev.

PETER DOYLE of Cripple Creek is examining mines at Marysvale, Utah.

GEO. WAUGH has been appointed Supt. Portland mine, near Deadwood, S. D.

T. SYMINGTON is superintending work at the Atlas mine, near Tuttletown, Cal.

L. S. AUSTIN will be Supt. and metallurgist for the smelter at Cerillos, N. M.

JUDGE KINLEY of San Francisco has been in San Andreas, Cal., on mining business.

HOWARD BAXTER is the new assayer for the Chloride M. Co. at Dedrick, Trinity Co., Cal.

ELMER HILL, Mgr. Fortune M. & M., Bingham, Utah, has returned from a trip to New York.

J. M. WOLFE, Mgr. Republic M. Co., Republic, Wash., who has been East, has returned to the mines.

W. C. MORRISON, who has been in San Francisco on mining business, has returned to Placerville, Cal.

JAMES BREEN is to be succeeded in the superintendency of the Northport, Wash., smelter by A. W. Hudson.

H. W. HOYT, Sec'y Gates Iron Works, Chicago, visited the company's Salt Lake, Utah, agency on the 8th inst.

W. C. TURNER is Supt. Hazel Dell mine, Carters, Cal., succeeding A. Campbell, who has gone to Mexico.

E. H. WEBSTER is assayer for the Colorada-Creston M. Co., Minas Prietas, Mex., vice G. N. Powell, resigned.

W. C. RALSTON, Pres. California State Miners' Association, has returned to San Francisco from Calaveras Co., Cal.

WM. MOOREHEAD, former foreman Sierra Nevada mine, is Supt. Dreisman mine, Arrastraville, Tuolumne Co., Cal.

B. JONES, formerly at the Golden Gate mine, Mercur, has been appointed Supt. West Morning Glory mine, Tintic, Utah.

EDW. FOLTZ, formerly of Aspen, Colo., and lately with the Gladiator mine, A. T., is foreman American Flag mine, Prescott, A. T.

J. S. MACARTHUR, one of the original patentees of the MacArthur-Forrest cyanide process, is visiting the west coast of Tasmania.

HENRY LITTLE AND GEORGE DEATON of Colorado Springs, and J. C. Spicer of Criple Creek, have been in New Mexico examining mines.

C. O. BAKER JR. of Newark, N. J., has returned home after a three months' absence on the Pacific coast and Hawaiian islands.

D. TOOKER, who is operating with J. H. Devereux in the Chloride country, Mojave Co., Ariz., has returned to Kingman from a visit to Los Angeles.

GEO. O. BRADLEY of Salt Lake City, Utah, is preparing to open a mining and milling supply house in Spokane, Wash., having already secured quarters there for his business.

G. A. ROBERTSON, of Mammoth, Utah, leaves for Butte, Mont., Sunday, from where he will go to California to take charge of a mine and mill for George H. Robinson.

D. M. BURNS AND THOMAS H. WILLIAMS have returned to San Francisco from a visit to the Union mine, El Dorado Co., Cal., the present output of which is reported to be about $1000 per day.

T. R. BARD, California's new Senator, made most of his money in California oil. Nearly all the rich United States Senators have made their money in mining—Clark, Stewart, Hanna, McConnell, Jones, Elkins, etc.

Commercial Paragraphs.

JOHN WIGMORE & SONS CO., Los Angeles, Cal., have sent a carload of mining machinery to the Commonwealth mine, Pearce, Ariz.

THE Gates Iron Works, through Geo. O. Bradley, secured the contract to erect the new Republic mill, Republic, Wash., of which Daniel C. C. Jackling is Supt.

THE Union Steam Pump Co., of Battle Creek, Mich., have lately placed several of their make of pumps with the Tamarack, the Hecla, and the Calumet copper mining companies of northern Michigan.

THE J. H. Montgomery Machinery Co., 1220 Curtis street, Denver, Colo., have sold a 5-stamp mill to the Mount Pisgah M. & M. Co., Florissant, Colo., and a 50-ton crushing and concentrating plant to G. W. Ingersoll, Woodland Park, Colo.

THE Mine & Smelter Supply Co. recently shipped from its Salt Lake City branch the hoisting and pumping machinery and other equipment for the Oregon & Pennsylvania mine, near Sumpter, Or.; also, a similar shipment to Republic, Wash., to equip the Chico group in the latter camp.

THE Metropolitan Electric Supply Co. of London, England, one of the largest electrical concerns in the British Empire, has placed an order for four 90-gallon Cross oil filters, manufactured by the Burt Mfg. Co., of Akron, O., for use in their stations. The British Government has been a large buyer of these goods during the past year, notwithstanding the fact that the English makes are both plentiful and cheap.

THE Colorado Iron Works Co. of Denver, Colo., have sent a complete copper smelting furnace to the Whipsaw Copper Co., Whipsaw, Ariz., two 150-ton chlorination barrels to the Republic Reduction Works, Republic, Wash., and have orders for ten Bartlett concentrating tables, three sets 6x30-inch sectional high-speed crushing rolls, calcining furnace for the Compania Mexicana, Old Mexico, four self-dumping slag trucks for the Arizona Copper Co., Clifton, Ariz., and castings for five Buckner roasting furnaces for Utah.

THE Pike's Peak Power Co., a corporation controlled by the Woods Investment Co. of Victor, Colo., has just closed a contract of considerable magnitude and importance to those interested in the development of hydraulic power and electric transmission. They propose to transmit power from Beaver creek, located about ten miles from Victor, for the purpose of running the mill, hoist and reduction works of the Gold Coin Mining & Leasing Co., one of the richest mines in Cripple Creek. The hydraulic conditions are particularly favorable, as they embrace a total head of 2300 feet, obtainable in about 6000 feet of pipe, and a water supply sufficient to produce 5000 H. P. The intention is to divide the power plant into two separate units, the first unit being situated at a point affording a head of 1150 feet. The water, after passing through the first set of wheels, will be led into another pipe and thence down to the next station, 1150 feet below. Thus the water does double service, and the arrangement divides the liability of accident between the two plants—insuring absolutely continuous service at all times. The first plant, which is now under construction, is supplied by a sheet steel riveted pipe line 3200 feet long, 29 inches diameter, and varying in thickness from $\frac{3}{16}$ to $\frac{5}{8}$ of an inch. The power units consist of four 375 K. W. General Electric generators, running at 450 revolutions per minute. Each generator will be direct connected to a pair of Pelton water wheels, 69 inches diameter and of a combined capacity of 675 H. P., each wheel being supplied with deflecting nozzle. The wheels and generators will be mounted on separate base plates, and shafts will be connected by means of combination flywheel couplings. The plant when completed will represent the highest development in hydraulic-electric work and will be a model in every particular. The complete hydraulic system, including pipe line and water wheels, is furnished by the Pelton Water Wheel Co. of San Francisco, the electrical apparatus being supplied by the General Electric Co. The Woods Investment Co. control large holdings in the Cripple Creek district, and it is the ultimate object to establish a general transmission plant to supply the mines and railways in the vicinity.

List of U. S. Patents for Pacific Coast Inventors.

REPORTED BY DEWEY, STRONG & CO., PIONEER PATENT SOLICITORS FOR PACIFIC COAST.

FOR THE WEEK ENDING FEB. 6, 1900.

643,037.—CUT GRAIN CARRIER—Henry Bryan, Modesto, Cal.
643,040.—SCREW HOLDER — Carvin & Bourland, Valley Springs, Cal.
643,096.—SAVING GOLD, ETC. — S. B. Christy, Berkeley, Cal.
642,785.—ROTARY ENGINE — J. Craig, Highland Springs, Cal.
642,681.—CAN HEADING MACHINE—W. F. Davis, S. F.
642,968.—LIQUID RAISER—R. W. Elliott, Oakley, Cal.
642,791.—ANIMAL EXTERMINATOR—J. T. Gray, Hollister, Cal.
642,747.—DUST PREVENTER—J. Kullman, Benicia, Cal.
642,616.—COOKER—C. O. Lee, So. Tacoma, Wash.
642,798.—TEACUPS — A. E. Macdonald, S. F.
642,706.—GAS ENGINE—A. L. Navone, Calistoga, Cal.
642,853.—HYDRAULIC GIANT—J. P. Simmons, S. F.
642,638.—BASKET BAT—A. B. Smith, Los Angeles, Cal.
642,639.—PLAYING BALL—A. B. Smith, Los Angeles, Cal.
673,013.—REFRIGERATER—J. C. Stuart, Puyallup, Wash.
642,936.—POWER TRANSMITTER—F. C. Thompson, Burton, Wash.
643,016.—BICYCLE RACK — W. Thum, Pasadena, Cal.
643,075.—WATER VALVE — J. W. Van Brocklin, Seattle, Wash.
643,076.—WATER VALVE — J. W. Van Brocklin, Seattle, Wash.
642,735.—DRAFT EQUALIZER—F. G. Vestal, Pleasant Grove, Cal.
32,194.—DESIGN—C. A. Conger, Oakland, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GAS ENGINE.—A. L. Navone, Calistoga, Cal. No. 642,706. Dated Feb. 6, 1900. This invention relates to improvements in what are known as gas or explosive engines. It consists of a cylinder closed at both ends with a piston, piston rod and connections by which the reciprocation of the piston is communicated to the mechanism to be driven. In conjunction with this piston moving from end to end of the cylinder are ports so arranged that there is a centrally located exhaust port and gas supply passages at each end of the cylinder, with inwardly opening spring-closed poppet valves and pipes connecting said openings and valves with a centrally disposed slide valve. A carburetor or gas supply is connected with the slide valve chamber, and means for reciprocating the valve so as to alternately admit the explosive gas to opposite ends of the cylinder at the instant when the piston has passed the exhaust port to allow the waste products of the former explosion to escape. This practically makes the engine double acting with a single cylinder. In conjunction with this is an air-forcing mechanism by which the explosive vapor and air are forced through the valve ports and connecting passages when opened so as to charge the cylinder by direct pressure at the instant of the closing of the exhaust passage.

AUTOMATIC CAN HEADING MACHINE.—W. F. Davis, San Francisco, Cal., assignor of one-half to J. Lee, Jr., same place. No. 642,681. Dated Feb. 6, 1900. The object of this invention is to place the heads upon the ends of sheet metal cans and assemble the incomplete parts preliminary to the final fitting of the heads upon the bodies, this being done without any special sizing of the bodies or fitting the heads thereto. It also comprises a means for applying and retaining the heads in contact with the main bodies until by the advance of the heading apparatus the bodies of the cans thus held are delivered into a supplemental crimping apparatus by which the heads are subsequently crimped and fixed upon the can bodies. The machine which embodies this invention comprises a series of journal disks, spiders or other carriers, each having a set of fixed segmental jaws, and so journaled with relation to each other and so driven by operating mechanism that pairs of segments upon the respective spiders will always be brought together so as to partially enclose a can body while the can heads are brought into contact and forced upon the ends of the can bodies. After this has been effected, the bodies having the heads in place are guided and delivered into a crimping machine which finishes the operation.

DRAFT EQUALIZER.—F. J. Vestal, Pleasant Grove, Cal. No. 642,735. Dated Feb. 6, 1900. This invention relates to a means for equalizing the draft and the application of power of large teams when applied for hauling harvesters, plows or other heavy machinery. In driving large teams composed of many draft animals, it is very difficult to equalize the power so that all the animals will have an equal amount of work, and this invention is designed to produce such equalization. It consists of draft bars to which the different series composing the team are so connected that the pull between part of the team counteracts the pull of the other. The equalizer bars are connected by chains which pass over pulleys so that the forward bar is connected with the second bar by, for instance, a single chain passing over a pulley, and a chain connects this pulley with another compound pulley device which connects with the third bar and with the implement or machine to be hauled and so on, each added team necessitating an additional pulley device.

TEA MAKING ATTACHMENT FOR CUPS.—A. E. Macdonald, San Francisco, Cal. No. 642,798. Dated Feb. 6, 1900. This invention relates to a device which is designed for use with tea cups and for the purpose of making a single cup of tea. It comprises a cover having a central opening and an annular flange rising from its outer surface and surrounding said opening. A screen basket is fixed in the opening, and a cup having a flange is adapted to fit the flange of the cover. This cover being set upon the cup, the tea within the basket will be immersed in the hot water in the cup and the tea can be drawn of any desired strength. By removing the cover and reversing it the tea leaves will fall from the basket into the cup and remain there and may be used again for another cup.

DUST PREVENTER FOR ROTARY PULVERIZERS.—J. Kullman, Benicia, Cal. No. 642,747. Dated Feb. 6, 1900. This invention relates to an attachment for preventing the escape of dust from apparatus which is designed for crushing and pulverizing bark, bones, brick, or other like material. It consists of a cap applied upon the outside of the pulverizer case and having no external openings. Holes are made through the case opening into this cap, the cap being fixed upon the case just above the feed hopper. The action of the cap appears to be to check the currents of air which are produced by the revolving beaters within the case, and to prevent such action as will throw the dust out of the hopper opening of the case.

COMPOUND FOR EXTERMINATING BORING ANIMALS.—J. T. Gray, Hollister, Cal. No. 642,791. Dated Feb. 6, 1900. Burrowing animals, such as gophers, ground squirrels, etc., are a great pest to agriculture generally, and it is very desirable to discover some means by which they can be readily exterminated. This is effected by the present invention which consists of a compound of ingredients which will produce a suffocating vapor and this is applied to a suitable carrier which can be introduced into the burrow of the animal and ignited so as to form the suffocating fumes which will destroy the animal.

Recently Declared Mining Dividends.

Rambler-Cariboo Mines, Ltd, $10,000; payable Mar. 1.

Silver King, Utah, 50 cents per share, $75,000; Feb. 10.

Montana Ore Purchasing Co., $1 per share, $80,000; Feb. 15.

Deer Trail Con. M. Co., Stevens Co., Wash., first dividend of ¼ cent a share, $7500, on 3,000,000 shares; Feb. 10.

Homestake M. Co., South Dakota, regular monthly dividend 25 cents per share, and extra one same amount, aggregating $105,000; payable Feb. 25.

Books Received.

"U. S. Geological Survey and Atlas," 19th report, Part V, Forest Reserves. Copies on application to U. S. Geological Survey or through U. S. Senators and Representatives.

"A Manual of Practical Assaying," H. Van F. Furman, quarto, pp. 463, the latest, fifth edition of an unusually complete work. Considerable of the matter was originally published in technical journals, and the present state of the art justifies the addition of new matter and a re-editing of much that was in the earlier editions. Jno. Wiley & Sons, N. Y.; $3.

Latest Market Reports.

SAN FRANCISCO, Feb. 15, 1900.

SILVER—Per oz., Troy: London, 27⅜d (standard ounce, 925 fine); New York, bar silver, 59⅞ cts. (1000 fine); San Francisco, 59⅞: Mexican dollars, 47¾c.

COPPER.—New York: Lake, 1 to 3 casks, 16.75 cash; carload lots, 16¼; Electrolytic, 1 to 3 casks, 16.50; carload lots, 16.00; Casting, 1 to 3 casks, 16.25; carload lots, 16.00. San Francisco: 17½@18. Mill copper plates, 23¾c; bars, 25½@27c.

LEAD.—New York, $4.70; St. Louis, $4.70; San Francisco, $5.00; pipe 7½, sheet 8¾, bar 6½c. London, Soft Spanish Lead, £16 10s=4.71c per lb.

UTAH and CALIFORNIA

Are two of the most magnetic names in the roll of States, and the best way to reach them is over the Rio Grande Western Railway. "Great Salt Lake Route" As the name intimates, the Rio Grande Western is the only line that passes directly through Salt Lake City on the way to California; and Salt Lake City and the Great Salt Lake are the two points which should certainly not be missed on your western trip, as they contain more interest to the average American than any two other points within the confines of the United States. Study the matter carefully and you will choose the Rio Grande Western for this reason as well as for the magnificent scenery, superb equipment and fast time. It is the popular route during the winter as in summer. Write to GEO. W. HEINTZ, General Passenger Agent, Salt Lake City, for particulars.

FOR SALE.

10 H. P. Gasoline Hoist for Sale.

Complete outfit in good condition. Price low. Address PAUL J. PITNER, Placerville, Cal.

FOR SALE.—DIVIDEND-PAYING, HYDRAULIC placer. Extensive deposits. Old channel gravel, water, pressure, grade, dump, and gold. Rigid investigation invited. Thoroughly legitimate. Banking references. Owner. IDAHO, care of Mining and Scientific Press.

SMOOTH-ON CASTINGS.
An iron cement in powdered form, for repairing leaks or fractures in steam or hydraulic work applied by mixing with water; hardens quickly and expands in hardening. When hard it will with stand a red heat, steam, water or oil, and expands and contracts with heat and cold the same as iron, insuring a tight joint at all temperatures. Difficult flange connections can easily be made with Smooth-On, as it adapts itself to the flanged faces whether parallel or not. Connections are easily taken apart. Unequaled for boiler patching, and repairing blemishes in iron castings. Write for catalogue and prices. Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

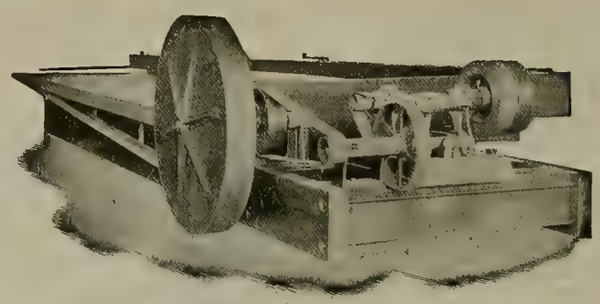
For Testing Placer Ground.

Sinks and drives 6, 8 or 10-inch pipe through boulders; takes all the loose material out, including gold, as the hole is sunk. Does the work at a very small cost. Drills water and oil wells and mineral test wells through any kind of rock to 1500 feet. Several sizes. Unexcelled for lead and zinc testing.

KEYSTONE DRILLER CO., Beaver Falls, Pa.



WHITE, ROGERS & CO.,

Contracting Engineers and Millwrights,

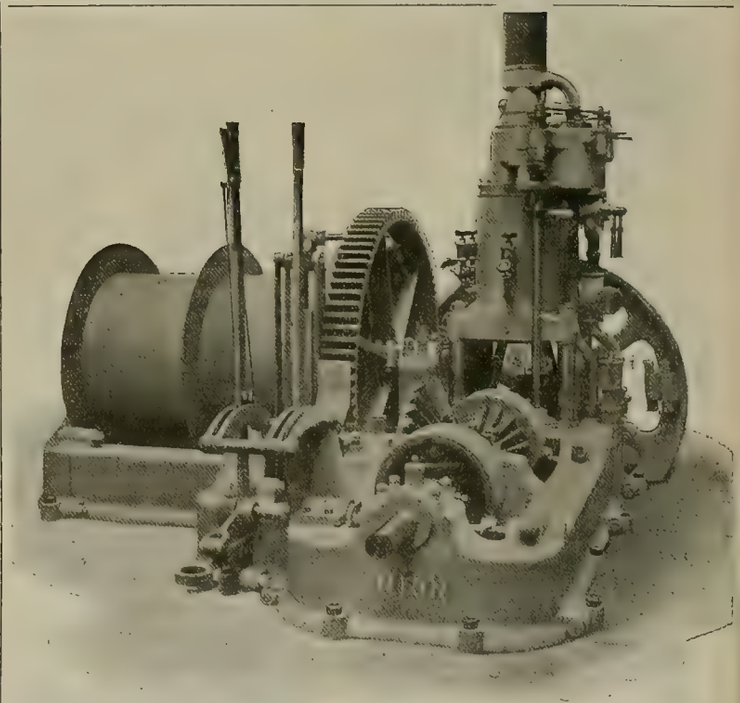
OFFICES, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, $450, F. O. B., San Francisco.



One of these machines will take the place of two or three belt concentrators of any style and do very much better work. Easy adjustment. Little wear.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

SEND FOR CIRCULARS.

These Machines are Kept in Stock Ready for Immediate Shipment.

The above illustrates the "Union" 25 H. P. double cylinder divided drum mining hoist for double compartment shaft. Cages and cars balance each other, therefore power is only used to raise ore; cost of hoisting ore is therefore reduced to the minimum. Made in sections for mountain transportation.

"UNION" ENGINES Are Simple, Durable and Economical.

Office, 314 Howard Street, San Francisco, Cal.

The "Pelatan-Clerici" Process

OF TREATING REFRACTORY ORES

Saves the precious metals by the simplest, most economical and most efficient process known. No roasting or previous treatment, except ordinary crushing. Extraction complete in from 6 to 12 hours. Extracts equally well both fine refractory gold and coarse gold in the form of amalgam. Makes a greater saving of gold than any other process from raw material at less cost. The electric current and dissolving agent promptly dissolve the precious metals, both gold and silver. Samples of ore tested free of charge. Several mills saving over 90 per cent of values by bullion returns. Simplicity. Economy. Efficiency.

PLANT FOR COAL WASHING, COKING AND STEAMING TESTS OF FUELS. ASSAYS, ANALYSES, CHEMICAL AND PHYSICAL INVESTIGATIONS OF ALL KINDS. MINERAL PROPERTIES, MINES AND METALLURGICAL PROCESSES EXAMINED AND REPORTED UPON. CORRESPONDENCE SOLICITED.

THE GRIFFIN
THREE ROLLER
ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the **LEVIATHAN BELT** has done, and we quote the following from a letter from the New York Steam Co.:

"We have used Leviathan Belting for four years, up to 24-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

The above illustration shows an operator taking an incline above the horizontal with BRUNTON'S PATENT POCKET MINE TRANSIT. The instrument is made especially for mining engineers, mine managers and superintendents, but its light weight and the ease with which it can be handled render it admirably adapted to the taking of topography and for geological field work. Write for catalogue B, giving full description of the instrument and all its uses, to

No. 043 BUTTON BALANCE, 10-inch beam. Sensitive to 1-100 Milligramme. This is a double-column button balance with all latest improvements, including our new adjusting device and rider rod lock. It is accurate and as rapid as a beam of this length can be. For an office doing a moderate amount of work, it is the best balance to be had for both gold and silver. For complete description and prices of this and other balances send for catalogue A to

(SEE PAGE 193)

THE : CAMMETT : CONCENTRATOR.

Designed with some Regard for the Laws of Concentration.

We have reports from mills employing Cammett concentrators for the treatment of ores containing galena, iron sulphide and zinc blende, that they are regularly producing on each table three distinct concentrates—one of galena, one of iron sulphide and one of zinc blende, each of which is commercially clean.

Practical experience with the Cammett concentrator proves that it **saves** and **delivers** into the **concentrates box** slimes so fine that to prevent them from being lost from the **concentrates box** it is necessary to provide several additional overflow tanks.

Manufactured Under U. S. Patent No. 632,892; Dated Sept. 12, 1899.

ASSESSMENT NOTICES.

MARINA MARSICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 25th day of January, 1900, an assessment (No. 22) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of February, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 19th day of March, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

CALIFORNIA BORAX COMPANY.—Location of principal place of business, San Francisco, California; location of works, San Bernardino County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 26th day of January, 1900, an assessment (No. 2) of Two ($2) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of March, 1900, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, room 36, San Francisco, California.

MARIPOSA COMMERCIAL AND MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 15) of Ten ($10) Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 24, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of March, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 3rd day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JOSEPH H. MOOSER, Secretary.

Office—320 Sansome street, room 24, San Francisco, California.

SIERRA NEVADA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 118) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Tuesday, the 13th day of March, 1900, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of April, 1900, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. L. PARKER, Secretary.

Office—Room 14, Nevada block, No. 309 Montgomery street, San Francisco, California.

CENTRAL EUREKA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sutter Creek, Amador County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of February, 1900, an assessment (No. 14) of 3 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 320 Sansome street, room 9, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of March, 1900, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 9th day of April, 1900, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

HERCULES HOISTS Are Sold the World Over.

Hercules Gasoline Hoist--Speed 385 Ft.; Load 2500 Lbs.

HERCULES GAS ENGINE WORKS.....141-143 FIRST STREET, SAN FRANCISCO, CAL.

DON'T SAVE PENNIES AND WASTE DOLLARS

in the purchase of a Gasoline and Oil Engine and Hoist. Buy the best—the Weber—and get results. Full particulars on request.

Weber Gas & Gasoline Engine Co.,
430 S. W. Boulevard,
Kansas City, Mo

LUNKENHEIMER

On your brass and iron goods means superior quality, and is a guarantee that said article is the best of its kind made. Intelligent steam users recognize this fact hence they are always specified where the best is wanted. All dealers in Mining Machinery and Supplies carry "The Lunkenheimer" goods in stock. Our catalogue will convince you; free for the asking.

THE LUNKENHEIMER CO., Cincinnati, Ohio, U. S. A.,
SOLE MANUFACTURERS.

— BRANCHES: —

NEW YORK.....26 Cortlandt Street | LONDON, S. E.....35 Gt. Dover Street
PHILADELPHIA.....Bourse Building | MEXICO CITY, Puente de San Francisco No. 6

Why Detroit Lubricators Should Be Preferred.

In addition to their many other good qualities, the Detroit Lubricators are made extra strong and heavy, each one being tested at a pressure of 300 lbs. to the square inch before it is allowed to leave the factory. This is probably twice as high a pressure as they will ever have to work under, so they are very durable and longlived, and, unless injured by accident, will not require any repairs for years. For this reason, they are particularly well adapted to users in the Rocky Mountain district and on the Pacific Coast, where it is expensive and inconvenient to get repairs. Our catalogue showing our different styles of sight feed lubricators, glass and brass oilers, oil pumps, oiling devices, etc., will be sent on application.

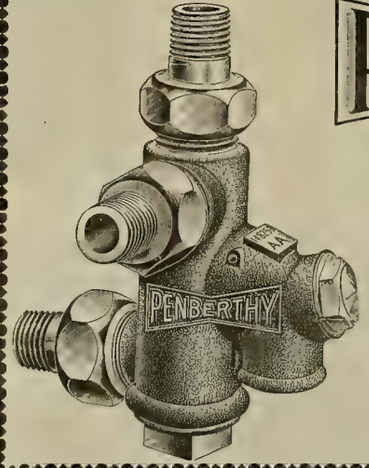
DETROIT LUBRICATOR CO., DETROIT, MICH.

FRANCIS SMITH & CO.,
—MANUFACTURERS OF—

SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.
46 FREMONT STREET, - - - - SAN FRANCISCO, CAL.



Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared for coating all sizes of Pipes with Asphaltum.

10,000 Feet New RUBBER BELTING.

We have recently purchased in original rolls direct from factories nearly 10,000 feet of leading brands of Rubber Belting, slightly damaged, but utility of which is unimpaired. We present the unusual opportunity to consumers of saving 50 per cent in the purchase of their belting. We also carry a large stock of New and Second-Hand High Grade Leather Belting. WRITE FOR PRICES.

ROBERT BRAND & CO.,
(Manufacturers "Minnesota Chief" Threshers), 527 & 529 THIRD ST., OAKLAND, CAL.

200,000 IN USE.

TRADE PENBERTHY MARK.

AUTOMATIC INJECTOR.

The World's Best Boiler Feeder.

SIMPLE, RELIABLE, DURABLE.

ECONOMICAL, 99 22/100 EFFICIENCY.

We make Jet Pumps, Oil and Grease Cups, Etc.

Catalog on application.

Penberthy Injector Co.,
DETROIT, MICH.

DEWEY, STRONG & CO., Patent Solicitors, 330 Market St., San Francisco, Cal.

RISDON IRON WORKS,

SAN FRANCISCO, CALIFORNIA.

Cable: "Risdon's." Code: A. B. C. & Leiber's.

MANUFACTURERS OF

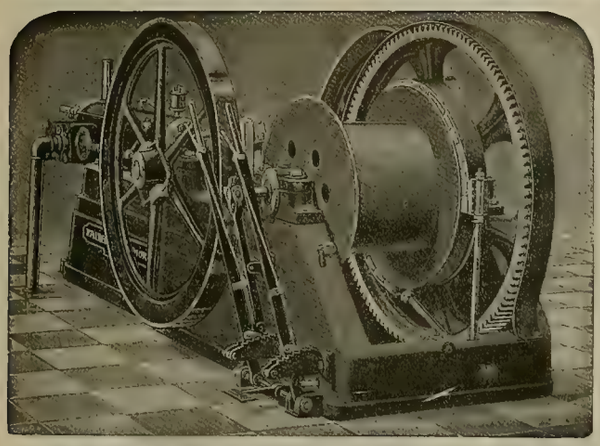
Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines

OUR SPECIALTY.

We build **GOLD DREDGES COMPLETE IN RUNNING ORDER** to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.



Send for Dredging Catalogue No. 17.

—WE ALSO BUILD—

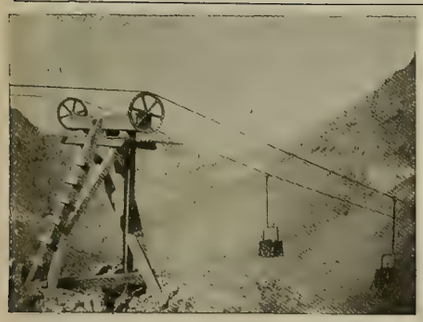
All kinds of Mining, Milling, Concentrating, Pumping, Air Compressing, Hydraulic, Water Wheel and Hoisting Machinery.

EVANS HYDRAULIC GRAVEL ELEVATORS.

We publish sixteen catalogues. Write for one in the line you are interested in.

FAIRBANKS-MORSE GASOLINE-DISTILLATE GEARED HOISTER.

An efficient and reliable combination of a Fairbanks-Morse Gasoline-Distillate Engine on the same base with a Friction Hoist. Modern and up to date. We publish a special catalogue describing our Hoister which we gladly mail prospective purchasers.



FAIRBANKS-MORSE GASOLINE-DISTILLATE ENGINES.

ALL SIZES UP TO AND INCLUDING 54 HORSE POWER.
For Pumping, Milling, Lighting, Air Compressors, Etc.

FOR CATALOGUES AND FULL INFORMATION, ADDRESS

FAIRBANKS, MORSE & CO.,

1600 SEVENTEENTH ST., DENVER, COL.
FRANKLIN AND MONROE STS., CHICAGO, ILL.

THE HALLIDIE ROPEWAY

For Transporting Ore, Fuel, Earth, Sugar Cane, etc., by Wire Ropes.

SIMPLE, ECONOMICAL, PRACTICAL, DURABLE.

LOADS MECHANICALLY. DUMPS AUTOMATICALLY.

WIRE TRAMWAYS (Single and Double Rope Systems),

Cableways, Transmission by Wire Ropes,
Incline Planes, Cable Grips,
Logging by Cables, Automatic Loaders,

PLOWING, SCRAPING AND TRANSPORTING by Wire Ropes,

DESIGNED, SUPPLIED AND ERECTED. Estimates Furnished.

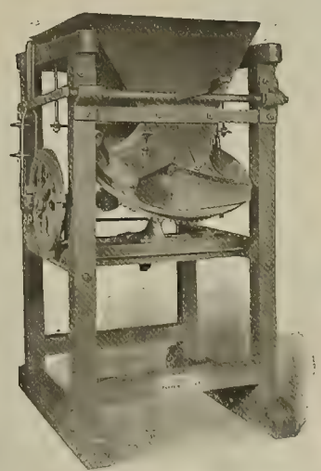
Improved GRIP PULLEY.

Patents Nos. 483,442; 610,353.

EFFECTIVE, SIMPLE, AUTOMATIC.

Saves Wear on Wire Rope and Cable.

Send for Illustrated Pamphlet. Correspondence Solicited



CALIFORNIA WIRE WORKS, - 9 Fremont St., San Francisco, Cal.

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.
" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

Licensee for the Manufacture and Sale, PARKE & LACY CO., 21 & 23 FREMONT STREET, San Francisco, Cal.

SOLE AGENT FOR

INGERSOLL-SERGEANT ROCK DRILLS and AIR COMPRESSORS.
KNOWLES PUMPS and PULSOMETER PUMPS, BULLOCK DIAMOND DRILLS.

CATALOGUES FREE ON APPLICATION.

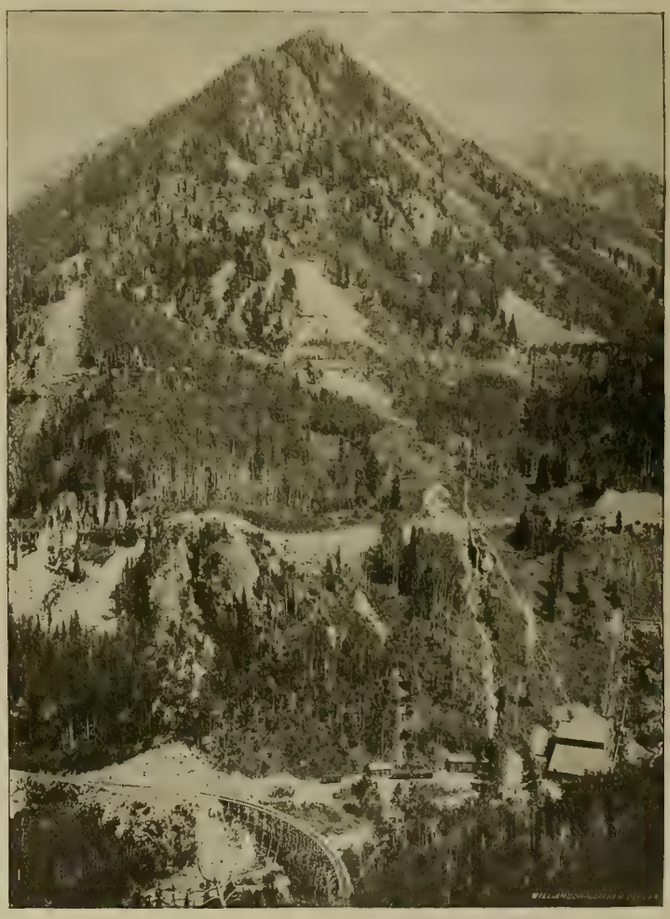
No. 2068. — VOLUME LXXX. Number 8. SAN FRANCISCO, SATURDAY, FEBRUARY 24, 1900. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.



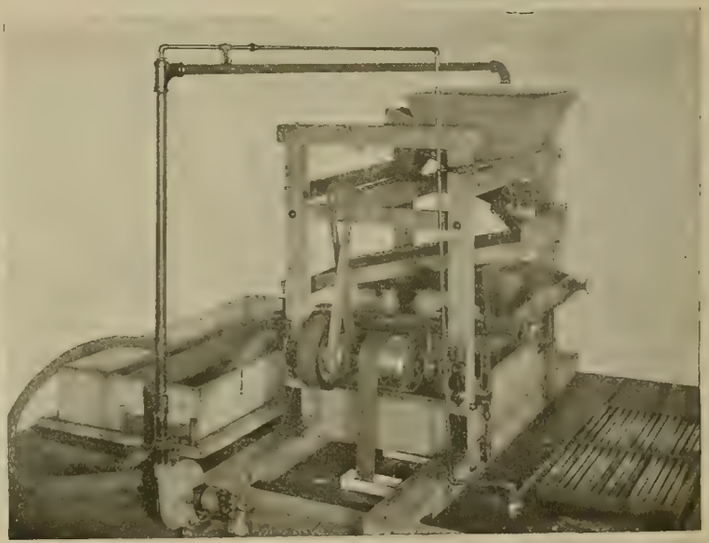
The Butterfly, Colo., Mine and Mill.

In last week's issue on this page appeared two illustrations from photographs, taken expressly for the purpose, of one of California's high gold mines, the May Lundy mine and mill, Mono county, about 11,000 feet above the sea. In Colorado are many mills at even higher altitudes. One of these, in San Miguel county, is represented herewith, through the courtesy of the Journal of Telluride, Colo. Colorado enjoys unusual railroad facilities, and its several transportation companies have done much for that State's mining industry. These roads traverse territory at an altitude of 10,000 or 11,000 feet, and make profitable the working of many mining properties whose position would ordinarily preclude possibility of profit. Such a property is the Butterfly mine and mill, in Ophir district, where the railroad, circling to the summit of the Rockies, creates a community that, like others of its class, produces a permanent addition to the world's wealth in the shape of monthly gold yield.

The Butterfly property is to be transferred on the 15th prox. for $200,000. The mill shown in the accompanying illustration is of small proportions—thirty stamps, 800 pounds each—with a daily capacity of 120 tons, run by water power, but clearing $150 per day on $10 ore. The new owners will, of course, increase the mill's capacity, as there is abundant ore. A spur from the Rio Grande Southern runs to the mill; concentrates and mill product are loaded direct from the mill to the cars, affording opportunity for that economy in handling that goes so far toward making profitable a mining property. The difference between California and Colorado milling methods is accentuated by the slow-drop performance of the stamps in the Butterfly mill, that system being deemed more desirable in the amalgamation of the ore containing so large a percentage of pyrites, as in this case; in sharp contrast to the heavy stamp, rapid-drop system in vogue in California.

Mining at Cape Nome, Alaska.

The present interest manifested in Cape Nome, Alaska, justifies continued reference thereto. In previous issues have appeared abundant information concerning that region, and illustrated articles showing how beach mining is carried on there. Herewith is portrayed a familiar scene—men mining the beach sands there with a rocker, a primitive and often a wasteful way of securing the gold there. The necessity for some other device has occasioned the production of several styles of apparatus, designed to secure economical saving of a higher percentage of the gold, some of which will have opportunity next season of proving their practical value. One of these devices is the Drake amalgamator, made and supplied by the Krogh Manufacturing Co. of San Francisco. An illustration of the machine is presented. It will be noted that there are six sections of riffles, eight riffles to each section, framed to permit of easy removal. Quicksilver may be used, but the manufacturers claim that "with the proper means of segregation a large percentage of the values can be saved without the use of quicksilver." The shape and arrangement of the riffles provide a uniform width of discharge of about 36 inches. Its capacity is stated to admit of handling over 100 tons of material in twenty-four hours with less than three miners' inches of water, the amalgamator being considered adapted to the saving of flour gold, as well as any form of gold that will settle or amalgamate. The machine is made for hand or motor power and has been in practical operation.



The Butterfly Mill, San Miguel Co., Colo.

Straight up half way to the top of the mountain in an open spot is dimly seen the openings to three levels of the mine. In the center foreground is shown the Rio Grande Southern bridge across Lake Fork, 100 feet above the creek bed Half way between the mill and mine the same railroad is seen climbing up and around the mountain.

"Grubstaking."

In a country like the United States, wherein are large areas of mineral lands, much of it unprospected and a very small fraction of it developed; wherein the people are generally prosperous and a large number of them wealthy; wherein mining has been the beginning or the whole of many fortunes, and where those fortunes are still largely employed in the business, constituting a safe precedent; wherein method and appliance advance first, and the technical side of the industry is represented by most competent men—it would seem, in such a country, that the homely termed business of "grubstaking" should be profitable employment for incomes beyond reasonable requirements. There are men to be picked out from many, and yet they are not few, who possess the qualifications necessary to successful prospecting. Hardy, energetic, intelligent and honest should be the label on a man before he is entrusted with the funds of his backers. In addition, he should possess some knowledge of mineralogy, geology and lithology; but, more important than these, is experience. Assuming that this kind of a man is to be had, suppose him to be furnished with a monthly allowance—say, $100—sufficient to support and transport him, pay for assays, etc., and assume that he will keep constantly at work for three years. This would be an investment of $3600—a less amount than is usually asked for the commonest kind of a prospect. It is almost certain that within the three years the man would find ten prospects worth $3600 and one worth $36,000. Of course, he would have to be considered and taken care of and he should be. Why isn't "grubstaking" a good investment?

Favorable Smelter Locations.

Among the projects earliest agitated in new mining districts is the establishment of a smelter. The inactivity of old districts is frequently attributed to the lack of a reduction plant. In the first instance, usually, development is insufficient to warrant the erection of a smelter for a long time after the enterprise is first suggested. In the second case, a dearth of smelting ore is the common explanation of the absence of smelters.

Naturally, the first essential to the successful operation of a smelter, or any other treatment plant for ores, is ore supply. Given this, the problem is, commercially, one of economics. Geographical location is an important factor, since in so many cases dependency on outside fuel supply is necessary, which implies dependency on lines of transportation. A smelting plant on a single railroad line is always at the mercy of that railroad, and always liable to unjust discrimination to the extent of being forced out of business.

The natural locations for smelters are centers to which subsistence is available in all directions. A smelter differently located is analogous and subject to the same conditions under which the treatment plant of an individual mine is operated. When the mine stops work the smelter stops work.

The growth of a small plant established to treat the ores of one section is necessarily proportional to the growth and yield of that section, and, unless so situated as to draw material from other sources, will go out of business if the few mines upon which it is dependent cease producing. Proper location, abundance of ore, requisite fluxes, satisfactory transportation arrangements, are among the prime necessaries of practise. With these it is also necessary to have abundance of working capital, and to transact business in a way to invite and retain public confidence and assure prestige and favorable reputation.

With all these it is necessary to have intelligent management. The possession of the requirements enumerated would fall short of success unless were included a manager fully competent. Such men are exceedingly scarce, and are rarely unemployed.

General Formula for Ore Fluxing.

The following question is sent in with request that it be answered in "Concentrates": "What per cent of fluxes is required for smelting an ore containing gold $6, silver 30 ounces, zinc 6%, lead 2%, copper 5%, pyrites 15%? How much coke per ton of ore?"

The question requires more extended answer than could be accorded in the condensed form of a "Concentrate." The percentage of fluxes required for smelting any particular ore must be determined from an analysis of that ore. The nature of the process employed is also a determinative factor in adjusting the proportions of materials used as fluxes. Important differences exist dependent on whether reduction takes place in a blast or reverberatory furnace, whether the furnace is running on a lead or copper basis; what the product is to be—whether bullion or matte, etc. In the above question is omitted the most important data necessary to determining requisite fluxes—the percentage of iron, silica and lime. From the analysis furnished it is supposed that a copper matte is the desired product, and on that assumption the required fluxes for a given product could be calculated if other necessary data were known, such, for instance, as the amounts of silica and sulphur in the ore. These questions are so often asked that herewith is given a formula for a "type" slag from which may be calculated the weights of material required when the analyses of the ores and available fluxes are known:

A = percentage silica (SiO_2) in ore.
B = " ferrous oxide (FeO) " ", going into slag.
E = percentage calcium oxide (CaO) " "
D = " magnesium oxide (MgO) " "
H = " barium oxide (BaO) " "
K = " aluminum oxide (Al_2O_3) " "
L = " zinc oxide (ZnO) " "

The oxides of magnesium, barium, aluminum and zinc may replace lime (calcium oxide) in slags in the following ratios:

MgO = 1.4 CaO.
BaO = .366 "
Al_2O_3 = 1.647 "
ZnO = .691 "

Then the equivalent of CaO (letting C = this equivalent) will be:

$$C = E + 1.4\,D + .366\,H + 1.647\,K + .691\,L. \quad (1)$$

The fluxes have the following compositions:

Iron ore: a = % SiO_2; b = % FeO.
Limestone: c = % SiO_2; d = % CaO.

If the limestone contains MgO, Al_2O_3, etc., the equivalent in CaO must be calculated as in equation (1).

Let x be the number of tons of iron ore required by 100 tons of ore.

Let y be the number of tons of limestone required by 100 tons of ore.

Then:

$$\frac{32}{60}\left(A + \frac{ax}{100} + \frac{cy}{100}\right) = 2\left(\frac{16\,B}{72} + \frac{16\,bx}{7200}\right) \quad (2)$$

And:

$$\frac{32}{60}\left(A + \frac{ax}{100} + \frac{cy}{100}\right) = 2\left(\frac{16\,C}{56} + \frac{16\,dy}{5600}\right) \quad (3)$$

Then:

$$y = \frac{14\,a\,(100\,B - 120\,A) + (120\,a - 100\,b)\,(14\,A - 15\,C)}{14\,bc + 15\,d\,(1.2\,a - b)}$$

And:

$$x = \frac{100\,B - 120\,A - 1.2\,cy}{1.2\,a - b}$$

A Continuous Gold Producer.

An editorial in the issue of the 20th ult., on California as being an exploitable gold region, has occasioned more than ordinary comment, the tenor of the communications received being commendable throughout. In connection therewith are noted three communications from representatives of foreign capital, who, in effect, say that it is not ordinarily supposable that a region "can keep on yielding gold forever." One gentleman, representing French capitalists, writes: "There is prejudice in Paris against California, on the ground that California is an old mining region. Newness of the country seems to be there a necessary requisite for investment in mines."

It is not in Paris alone that such skepticism prevails. In London, as well, exists the same belief regarding California. Indeed, such error is not unknown much nearer home.

So much has been written herein on this subject that it has hard to say anything good that would be new, or anything new that would be good.

Prominence in any field always entails penalty of some kind. It does seem difficult for men unacquainted with the facts, to realize that any region of the earth can continue to send out an average gold yield of $27,000,000 for fifty years without showing signs of exhaustion, and the very fact of its greatness as a gold producer and the half-century of its duration are cited, such amount and duration being considered an argument against possibility of continuance. As one of the communications referred to says: "No region can keep on yielding gold forever." That is, in plain English, the belief exists in some quarters that California is nearly worked out.

Nothing is further from the truth. The great gold yield of California was surface. It is only at a comparatively recent period that quartz mining began, and the era of deep quartz mining has scarcely commenced. The gold of California is as yet comparatively untouched; it does not lie on the surface as it did in the days when California was the sole gold producer, but takes capital to develop it. Other of California's resources have attracted attention, so that in California the gold mining industry constitutes but one of its wealth producers. It is this that has largely tended to overshadow California's greatness as a gold yielding region, while other Western commonwealths in which mining still continues the chief industry attract greater prominence thereby.

Constant development of new ground and continuous profitable working of old furnish evidence sufficient of the fact that California is not a "has been" in gold mining, but is merely a little out of present fashion with some investors, who are naturally more mindful of other newer attractions.

ONE of the usual industrial monographs issued deserves more than ordinary notice. It is entitled "A New Industrial Situation." It is published by the Westinghouse Machine Co., of Pittsburg, Pa., and directs deserved attention to a subject that has not escaped the notice of engineers, but is of even more importance than is generally realized—viz., that gas supplied at reasonable cost, economically conveyed and properly utilized, offers a superior form of fuel, and that the gas engine is a motor that admits of even greater field of economic use than it has attained. The subject is one of importance to this west half of America, and what has been done in mining, marine engineering and manufacturing by the gas engine affords but an index of what may be accomplished in every industry where power is required. The 150 H. P. engine of the Union Gas Engine Co. of San Francisco or the 650 H. P. gas engine of the Westinghouse Electric & Manufacturing Co. of Pittsburg, is but illustrative of the scope of power.

ON page 206 of this issue a communication from A. H. Ricketts indicates an untoward condition of judicial affairs that acts as an additional and unnecessary clog on the mining industry, or, at least, upon those engaged therein who are so unfortunate as to be obliged to defend or maintain their rights. As the matter now stands, the same legal recognition accorded an alien or a resident of another State is denied a resident of California—a condition of affairs that should receive prompt remedial action on the part of Congress. It is only by our national legislature that the door can be opened.

Concentrates.

THE average heat value of natural gas is 1000 B. T. U. per cubic foot.

"ABSOLUTE ZERO" is 460° F. below the zero of the ordinary thermometer.

IT is necessary to get permission of the owner of land to prospect thereon, legally.

MORTAR made from stamp sand is superior to that made with or from the ordinary river or bank sand.

A BANK may apply deposits to a matured debt of a depositor, or to the unmatured debt of an insolvent depositor.

WORDS employed in contracts are to be construed by courts in accordance with their plain, natural and obvious meaning.

THE boiler having the largest fire surface will produce the most steam with equal amounts of fuel, and is the most economical.

CARBON is twelve times heavier than hydrogen; oxygen one and one-third times heavier than carbon, and sulphur twice as heavy as oxygen.

AN article upon which the patent has expired may be made and sold by any one under a name different from the one by which the invention is generally known.

IMPURE WATER may be made almost immediately potable by adding to it the following mixture: Calcium permanganate, 1 part; aluminum sulphate, 10 parts; fire clay, 30 parts.

THE Boer Finance Minister is reported commandeering $200,000 gold per month from the output of the Rand mines. The Transvaal Government is said to be monthly coining 150,000 Kruger sovereigns.

THE suit of H. C. Frick against the Carnegie Steel Co. of Pittsburg, Pa., is to secure a greater price for his stock in that corporation. He asserts that this year's profits of the company will be $42,000,000.

"SEIGNIORAGE" means simply mint charges for coinage. It is ordinarily used in connection with silver, and was, primarily, the difference between 129 and the current price of silver per ounce, less the cost of operation.

WHEN the commutator of a dynamo is turned off, should there be one segment worn deeper than the rest, it is possibly caused by the winding being a little out of balance, sparking and arcing being accentuated at that point.

WITH water pressure 100 pounds to the square inch, to drive a 24-inch Pelton water wheel direct connected to a 200-light dynamo, a 1¼-inch nozzle will give necessary power at 580 revolutions per minute, using 56 cubic feet water per minute.

WHERE a debtor has the election to pay either money or property within a certain time, and he fails to exercise his option and make a tender at the time fixed, he loses his election, and the obligee has the right to demand the money and sue for it.

THE temperature of the flame of an arc electric light, 1000 volts, 2000 candle power, cannot be accurately determined. In an ordinary arc light the temperature of the negative carbon is put at 3000° C., and that of the positive carbon at 4000° C.

STEEL containing 18% nickel heated to a cherry red and worked on the anvil till cold will have the hardness and elasticity, minus the brittleness, of a piece of tempered steel. This temper and hardness is produced by hammering. Quenching in water softens it.

A FIFTEEN-MILE breeze acting on a sail of 25 square feet would have a pressure of 28 pounds, or, allowing for the movement of the sail, 25 pounds. The speed per minute in feet multiplied by the pressure equals foot pounds of power, 440 feet×25=11,000÷33,000=⅓ H. P. so developed.

CAST-IRON pulleys may be lagged with leather without the use of rivets, by first brushing over the surface with acetic acid, which will quickly rust it and give a rough surface; then attach the leather to the face of the pulley with cement composed of one pound of fish glue and one-half pound common glue.

IN a drift gravel mine in California in ancient river channels the bedrock is often metamorphic slate, the "gravel" consisting of small boulders, a little quartz, small pebbles, sand and fine iron pyrites. The cap is usually volcanic cement. The cost of a tunnel 7x8 feet is from $10 to $18 per running foot.

THE fastest steam yacht is the Ellide, built by Mosher, of New York City. It has a speed of 40.2 miles per hour. Ayres & Son, Nyack, N. Y., are building a steam yacht which they expect to attain a maximum speed of fifty miles per hour. Its length is 130 feet, beam 12½ feet. The hull weighs twenty-two tons; construction is largely of aluminum.

SEVERAL systems are in use for sampling ore in place. Where accuracy is desired or essential, a good way is, if practicable, to secure impartial selection and proper distribution of value in the specimens for sample, to have returns checked by duplicates from mill runs from assayers' pulp prepared by accurate methods, recognizing throughout that a little extra judicious expense may save subsequent loss.

MINING explosives my be tested (1) by firing them by means of a loose fuse without a detonator; (2) by firing them in boreholes of different sizes. Experiments should also be made when an air current of high velocity is impinging upon the mouth of the borehole. This test is a most important one, for it has often been remarked that the worst accidents in mines have taken place where the shot which caused the disaster faced ventilating currents of high velocity.

THE Supreme Court of Colorado has held that where, in consideration of extension of time to pay purchase money of mining property, the buyer gives notes secured by deed of trust on the property, and agrees with the seller that he will, till payment of the debt, work the mine in mine fashion, the measure of damages for breach of such contract, for which the seller only has a cause of action, is the injury to the security.

IN the case of Jurgeson vs. Diller (114 Cal. 491) the court decided that work and labor in hauling ore from a mine, cutting and hauling timbers on a mine to be used for drifts in such mine, or extracting ore therefrom, is not "construction, alteration, repair or improvement," and that a laborer doing such work at the instance of a person not the owner is not entitled to a lien therefor, upon the owner's failure to post a notice of nonliability.

WORK is the exercise of force; energy is the capacity for work. Energy expended produces other energy. The sum of all the energies in the universe is always the same. Nothing can produce energy without itself being supplied with an exact equivalent of energy. The above is either right or wrong. If right, then "perpetual motion" is impossible. It is believed to be right. If susceptible of successful contradiction, our dissenting South Dakota correspondent is accorded the privilege.

NO ONE knows or can tell "what is electricity?" There are theories. One of the nicest of these theories is, perhaps, the one that considers electricity a "condition" of atoms brought about by chemical action, as in a battery cell, or by what might be called a severe irritation of the magnetic halo, as in a dynamo, and by other means, such as heat and friction. What this condition is is beyond man's knowledge. It may be a violent rotation, or it may be an equally violent vibration, of atoms. Probably the arc light would prove it to be a vibration. Friction in some form or other is present, as heat is produced before burning or destruction takes place. Even the filament of the best incandescent lamp falls to pieces; it can but work for a time.

IN some of the surface discoveries of mines when a considerable area covered by a blowout of iron oxide, associated or not with purple fluorspar, has been found to run well in free gold, the ground is prospected and developed to the depth of a few feet, and over a certain area, with plows and scrapers, the material so obtained being sent wholesale to the stamp mill, and often giving rich returns. The object of such work is not alone to get all the values out of such rich float, but in hopes of uncovering the vein of which it is the oxidized cap or blossom. In this way the Deerhorn mine, Summit Hill, Colorado, was opened up. In this case nearly $25,000 was thus obtained. The Anaconda or Gold Hill mine, in the Cripple Creek district, is another instance.

THE recent meeting of miners in Redding, Cal., and the subsequent meeting on the 20th inst., of the California State Miners' Association in San Francisco, was to consider and take action on the filing by the Mountain Copper Co. on 3500 acres of mineral land in Shasta Co., Cal., on the representation that it was agricultural land. The case also involved the question of taking up mineral land with "agricultural scrip," both matters being deemed contrary to the best interests of the California miner and prospector. The question is more than a local one, involving, as it does, some important principles. It is understood that in this particular case mutual conference and concession may result in an amicable arrangement.

THE commissioner of the United States land office at Washington, D. C., has ruled that a patent filed on mineral land must be carried through without delay. The person who makes the application on mineral land must proceed with his case or he loses all his rights after a reasonable time has elapsed. The custom has been to apply for a patent on lands, and then, in a great many cases, the person applying has allowed the matter to rest for years. The commissioner bases his ruling on section 2324 of the revised statutes. In making the decision a case involving land in Clear Creek county, Colo., was passed upon. No work had been done upon the land in twenty-five years, and the man who applied for a patent on it had never secured final action on the application.

AT a bore hole sunk by the Wheeling Development Co., at Wheeling, W. Va., which was 4500 feet deep and 4⅞ inches in diameter, and which was cased to the depth of 1570 feet, the strata in nearly as normal condition as possible, and dipping only 50 feet to the mile, the following results were shown: The increase of temperature between points 1350 feet from the top and 2236 feet from the top was about 1° per 100 feet. From a point 2236 feet from the top to a point 3730 feet from the top the increase in temperature was about 1⅔° per 100 feet. From a point 3730 feet from the top to the lowest point at which observations were taken, 4462 feet, the increase was at the rate of 1$\frac{73}{100}$° per 100 feet; that is, from a point 1350 feet deep to a point 2236 feet deep the increase of temperature was about 1° for 100 feet; from a point 2236 feet to a point 3730 feet deep the increase was at the rate of 1° for each 77 feet in depth, and from the point 3730 feet deep to the point 4462 feet deep the increase was at the rate of 1° for each 58 feet in depth. The average increase in temperature from the point 1350 feet from the surface to the point 4262 from the surface was at the rate of about 1° for each 75 feet in depth. The average rate of increase of temperature at the Sperenburg bore hole near Berlin, which is 4170 feet deep, was at the rate of 1° for each 60 feet in depth. At the bore hole of Schladabach, near Leipsic, which is 5740 feet deep, the increase was at the rate of 1° for each 68 feet in depth.

THE Bald Mountain channel of Sierra Co., Cal., affords example of coarse placer gold. The Ruby drift mine thereon has yielded about $700,000. Of this over 10% was in pieces over one ounce in weight, and about 50% was in pieces exceeding one-tenth of an ounce. The gold has been about 895 fine—finer than the gold in the veins from whence it originally came. The probable cause of the greater purity of the placer gold is the oxidization and dissolving of the other constituents of the nuggets, the gold remaing unaltered, at least on the surface. This has further demonstration in the fact that it is the experience of California hydraulic gravel mining superintendents, when considerable percolating water is found in the gravel breast, that there is usually a noticeable increase in the purity of the gold, at times to the extent of nearly 1% more than the adjacent gold not so affected.

THE Chilean mill, mentioned in last week's "Concentrates," is sometimes associated with the idea of the arrastra, from which it may be considered to have been developed. It is like a millstone set on edge, and so arranged that it will revolve in a circular track, the axle upon which it revolves being pivoted at one end, and a mule hitched to the other, as used in Peru. The Chilean mill and the arrastra both serve a purpose, the Chilean mill reducing the assorted spalled ore to pea size, thence to the arrastra, where about one-half the charge is first placed and thoroughly moistened as the peon revolves, about two and one-half ounces quicksilver being added as the grinding progresses, and the remainder of the charge is put in. From twelve to sixty hours is the limit for grinding, which depends on the nature of the ore and coarseness or fineness of the gold, amalgamation in the case of coarse gold being sometimes reached in twelve hours; and in the case of fine gold requiring even more than sixty hours.

TO MAKE nitrate of silver out of pure silver, place the silver in a beaker and pour into it three-quarters of a fluid ounce of strong nitric acid sp. gr. 1.4 for every ounce of metal. The beaker is heated till the whole of the silver dissolves. The solution is then poured into an evaporating basin, and the excess of acid driven off by boiling. The operations should be conducted in the open air. The salts left may be recrystallized by dissolving in the smallest possible quantity of boiling water, allowing it to cool. The crystals of pure nitrate of silver will gradually form. The salt remaining in the mother liquor can be recovered by evaporation. To prepare chloride of gold, the copper in the coin must first be eliminated. The gold coin is put into a beaker, and a mixture of three parts of hydrochloric acid and one of nitric acid is poured into it and heat applied until the metal is dissolved. The excess of acid is then expelled by evaporation. The impure gold chloride, when free from acid, is dissolved in boiling water, and a cold saturated solution of protosulphate of iron added, till a dark precipitate of pure gold is no longer produced. The precipitate of gold must be poured on a filter and washed by pouring boiling water constantly over it, till the wash water no longer produces a precipitate with a solution of barium chloride, proving that the gold is free from excess of sulphate of iron. The gold is again dissolved in nitro-hydrochloric acid, the solution evaporated to dryness, the latter part of the operation being carried on slowly to prevent spurting. The yellow crystalline chloride of gold thus prepared should be preserved in a well stoppered bottle or a sealed tube, as the salt is very deliquescent.

ALUMINUM wire is used for electrical transmission by the Snoqualmie Falls Co., Seattle, Wash., and the Yuba Power Co., Smartsville, Cal. In neither case is there reported entire satisfaction, though the standard of criticism can not be rigid as the idea can not be considered to have as yet entirely passed the experimental stage. A test of an aluminum cable was made recently by R. C. Carpenter. The cable is to be used for transmitting electric power from the falls of Apple river, Wisconsin, twenty-one miles to St. Paul, Minn. Through a single cable consisting of 7⅛-inch wires, 1500 H. P. will be transmitted, the voltage employed being 25,000. The chief disadvantage in extensive use of aluminum is the difficulty of soldering or brazing. To overcome this a sleeve joint has been designed for splicing, and three of these splices were tested. The splices are made by inserting the ends of the two cables to be joined in an aluminum tube about 25 inches long for a distance of about 9 inches, and then twisting the ends of the tube for six complete turns. The length of the twisted tube becomes 7⅜ inches and the estimated weight per foot of splice is 0.35 pound, while the same weight for the plain cable is estimated at 0.126 pound. No solder is used in the splice. The area of the seven wires amount to 0.0915 square inch. The cable was broken by placing the ends in the jaws of a testing machine and supplying the required power. Considerable difficulty was experienced in applying the stress so as to strain each wire in the cable equally. All breaks were due to the wires giving inside or below the splice. In no case was the holding power of the splice impaired, nor were all the wires of the cable fractured. The breaking load in pounds per square inch of metal was for the three cases, 16,550, 18,450 and 19,350.

Some Sample Inquiries and Their Answers.

A large number of questions are weekly received at this office, embracing requests for information on nearly everything connected directly with mining, mining law, metallurgy, assaying, chemistry, electricity, natural forces, different processes, machinery and all manner of appliances and devices connected therewith. An attempt is weekly made to answer most of these questions in "Concentrates," omitting the question itself to economize space, and supplying procurable information in brief, concise phrase. The information thus given is as near correct as possible; though, of course, only approximate, but the favor with which such matter is received indicates the value of the service. Not all the questions are answered; that would be manifestly impossible. Theoretical or abstract inquiries; questions that are evidently hypothetical, and those not within the scope or province of the paper are not usually given detailed attention; many are answered by mail, but the bulk of the inquiries received find answer on the page of "Concentrates." Many of these questions take considerable time and effort to answer, and quite often, after, sometimes, a month of inquiry, "Concentrates" confesses inability to give the desired information. What is therein published is, at best, only an effort, more or less successful, to furnish practical information to practical men on matters that concern their practical relations with problems that come up in their daily lives. The idea of "Concentrates" was first suggested by the fact that quite often from three or four different localities came the same general question, and one answer sufficed. It was often apparent that a question from an Idaho miner or one that a Montana superintendent asked, would, if properly answered, furnish a Utah or Colorado or California man with some useful hint regarding the same or kindred matter, and frequently readers have stated such has been the case. It has been said by old experienced miners that some of the answers are simple, indicating the absence of even rudimentary knowledge on the part of the inquirer. That is so; when these same experienced men began mining, they, probably, didn't know any more about those things than do some beginners now, who may, many times, be saved considerable costly experiment or experience by a few lines. Indeed, as one old prospector puts it: "Had I had such 'pointers' as I weekly see in the MINING AND SCIENTIFIC PRESS when I started out twenty years ago, they would have saved me many a hard knock and many a hundred dollars." But for one primary question put, come twenty that require research and reference to even approximately answer with any degree of correctness. Occasionally come questions that would require a technical treatise to even partially answer. It may be interesting to append a few questions received during the week. In each case the name of the writer is omitted:

Kindly publish answers to the following questions from an old subscriber:

When copper ores are unusually pure, say, a black oxide, without lead, iron, arsenic or antimony, is sulphuric acid commonly used, and is it the best for making a solution with a view of electrically depositing copper?

With such solution of such ores (possibly containing a few ounces of silver), approximately how much copper can be deposited per horse power in twenty-four hours? Of course, conditions must greatly vary this result, so only an approximate answer is desired.

Give the present method of electrical deposition of such ores, including recovery of contained silver.

Silverton, Colo.

To correctly and satisfactorily answer these questions would require either the writing of a complete treatise on the subjects, or else detailed research in the indices of the MINING AND SCIENTIFIC PRESS for the last six or eight years, where, in the several articles on the metallurgy of copper, is to be found the desired information.

Can a locator commence assessment work on the last day of December and hold the location lawfully?

Carrville, Cal.

This is one of those questions that cannot be intelligently answered without full knowledge of the facts. If the Carville, Cal., man located that claim any time during '99, he has all of 1900 to do the necessary assessment work thereon for the period ending Dec. 31, 1900. If he located it prior to '99—that is, as late as any time in '98—and did no work thereon aggregating in value $100, it is doubtful if beginning the necessary work Dec. 31, '99, would enable him to hold it if any one desired to legally relocate it after Jan. 1, 1900. The law, however, is lenient, and in those cases the good faith of the locator, his intent to comply with the meager federal requirements, is largely considered. No one can initiate a right by force or violence, and if the original locator was found doing requisite assessment work begun before the claim was "jumpable," and diligently prosecuted, the court would doubtless give him the benefit of the doubt if the matter came before it.

I want a plan or plans for building a cheap jig concentrator for lead-silver quartz. There is considerable silver-lead ore in this county that runs from $10 to $12 per ton, and would concentrate eight to fifteen to one, but the owners are too poor to build mills; in fact, their prospects do not yet justify a mill. Such information as you can give will be greatly appreciated by many miners.

Loomis, Wash.

One good plan is a hand jig. We have had an old, experienced miner draw plans and description of a jig that he has successfully used in a similar case, and as soon as the plans can be redrawn and engraved the illustrated matter will be published. Meanwhile, how would it do to try a 2-stamp, triple-discharge mill with a good sizing table, or suitable concentrators? Both mill and concentrator could be had for less than $1000, and would be of effective value. If our inquirer is unable or unwilling to put up that amount, he and his neighbors might make a joint affair of it. On page 106 of catalogue 12, second edition, issued by the Risdon Iron Works, San Francisco, is a good illustrated description of an ordinary Hartz jig. The Loomis man might buy the iron-work and build the woodwork himself.

I want to construct an arrastra and to find out the way to run it.

Globe, Arizona.

In the issue of Jan. 14, '99, and in that of Jan. 28, '99, appeared two exhaustive articles, occupying four pages in all, profusely illustrated, on "How to Build and Operate an Arrastra," each article separate and complete in itself, and written by experienced practical miners.

It is desired to force twenty-five gallons of water per minute to an elevation of 500 feet, through a line of pipe 11,000 feet in length—the pipe will contain no bend of less radius than 50 feet, and only ten of these—what will be the most economical size of pipe to use and what horse power will be required? By answering the above in "Concentrates," you will greatly oblige.

White River, Cal.

Allowing for friction or resistance, the proposition is to lift 210 pounds water 530 feet per minute through an unusually long pipe. Nothing less than 3-inch pipe would be available. With that size pipe, theoretically, would be required 3.37 H. P.; 6 H. P. would be none too much.

Please give me the name of the manufacturer of the Acme pulverizer. I think it is made in Philadelphia.

Spokane, Wash.

We are unable to furnish the information.

Can you inform me how to remove gold amalgam from copper plates without injuring the plates?

Shingle Springs, Cal.

One good way to free copper plates from gold is to put them over a charcoal, coal or coke fire, and slowly evaporate the quicksilver off them. Where admissible, the fireplace of a spare boiler can be utilized, using a thin, red fire. After the entire evaporation of the quicksilver, the plates should be slowly cooled, rubbed with muriatic acid and put in a damp place over night, then rubbed with a solution of sal ammoniac and niter, and again heated slowly over a red fire. They must not be allowed to get red hot; when the proper degree of heat is reached, the gold scale will rise in blisters, when the plates should be taken from the fire and the gold scraped off. Any part of the plate on which the gold has not blistered should be rerubbed with the solution and again fired. The gold scales should be collected in an earthen dish, and covered with nitric acid, till all the copper is dissolved, when the gold can be smelted in the usual way; but after it is melted corrosive sublimate should be put in the crucible till a blue flame ceases to be given off. An excellent article on this subject appeared on page 176 of last week's issue.

We have a very large deposit of low-grade copper ore and intend to erect a plant for the manufacture of sulphide of copper for the use of silver mills for the home market. Any information you could give us in respect to style of furnace and mode of reduction for a ten or fifteen-ton plant would be gladly received.

Acampo, Chihuahua, Mexico.

This gentleman appears to be too indeterminate in his statement. Probably correspondence with manufacturers of reduction plants might accord him a degree of exactness as to intent at present lacking. He says he wants to make "sulphide" of copper. Probably he means copper sulphate, or bluestone. In case his ore is a sulphide high in sulphur he can roast it in heaps and leach the copper sulphate out with water, and finally with a dilute solution of sulphuric acid. If the ore is a sulphide low in sulphur he will have to crush to about ¼-inch mesh and finer, roast in hand reverberatory furnace, or any of the many automatic furnaces, and leach in tanks with water and dilute sulphuric acid. If the ore is oxidized, carbonate of copper or oxide of copper, leach with dilute sulphuric acid. The resulting solution of copper sulphate has to be concentrated to say 36°–40° B. and allowed to cool gradually, so as to crystallize out the bulk of the copper sulphate, then either concentrated again or used over for leaching out fresh copper. Probably the wisest thing for our correspondent to do would be to hire a good man who knows all about this process and let him run it.

How can I best clean silver-plated amalgamating plates and how best restore dirty quicksilver?

Bismark, Mont.

A weak solution of cyanide of potassium or a strong solution of salt and water is recommended, using a brush with each. The presence of grease or oil is counteracted by the introduction into the battery of a saturated solution of wood ashes. Quicksilver is usually cleaned by washing and straining through a chamois bag. When it is dirty, or mixed with foreign substances, it must be retorted at a low temperature to thoroughly clean it. Reverting to cleaning the plates: a solution of vinegar and salt is recommended by some; dilute nitric acid is also used, the plates being at once rubbed with quicksilver after being washed with clear water. At very long intervals, or when closing down for an indefinite time, it is sometimes advisable to "sweat" the plates—that is, to pour a quantity of scalding hot water over them for some time. See also concluding sentence of answer to above question from Shingle Springs, Cal.

What is a contact vein? What is contact ore deposit? What is contact matter? How is an assay for gold and silver made inaccurate by the freezing of a cupel or scorifier?

Wardner, Idaho.

When one wall is composed of eruptive rock the vein is called a "contact." For instance: a metal bearing vein will often occur at the "contact" of a dyke and sedimentary rock, as porphyry and limestone. The "deposit" or "matter" may occur wholly within the limestone, as a replacement of the original mineral, and in other cases the mineral is wholly confined to the dykes. In either case it would be a contact vein. Some melted metals absorb oxygen from the atmosphere and expel it while cooling. If the metallic content of a scorifier or cupel is cooled suddenly on the surface, while the scorifier or cupel is still highly heated, the gas, when expelled from the interior, breaks forcibly through the solidified crust, carrying with it some molten metal. It is supposed also that solidification and re-melting increases the tendency to absorption by the cupel, but this is doubtful.

Can you or some of your readers tell what flux is necessary in making an assay of sulphide ores for gold containing graphite to overcome the loss of values and reason of same in ores containing graphite?

San Diego, Cal.

The occurrence of graphite in commercial sulphide ores in appreciable quantities is so unusual, and such little attention, if any, has been given such a combination, that it is difficult to explain the cause of loss of gold in the assay and furnish the remedy therefor, if indeed, such loss is due to the presence of graphite. Some suggestion might be offered if the composition of the ore were known. The sulphide of molybdenum is frequently mistaken for graphite. A loss might be occasioned by the deflagration of graphite causing a sputtering. It is suggested that the graphite be eliminated by panning or otherwise previous to the assay, and a comparison of results made. This will indicate the extent of influence of graphite in the loss.

What is the best reagent to use in making water suitable to use in a steam boiler which is strongly impregnated with ammonium sulphide?

Randsburg, Cal.

A similar question was given complete technical answer in "Concentrates" in the issue of the 10th inst.

What is the relative heat-producing capacity of one cord oak wood, one ton coal and one barrel (42 gallons) crude petroleum, or, in other words, how many heat units in the above quantities of the material mentioned?

Sulphur Creek, Cal.

Ordinarily, it has been determined by tests that two cords oak wood equal one ton steam coal; one pound coal will evaporate ten pounds water. At a recent Los Angeles, Cal., test, one pound crude petroleum evaporated 17.3 pounds water. Oak wood is credited with: calories 4750, British thermal units 8550; steam coal, calories 8500, B. T. U. 15,060; petroleum, calories 9700, B. T. U. 17,560.

This is a very interesting question, but an exact technical answer is difficult to briefly give, as so many elements enter into its correct solution. "The Calorific Power of Fuels," by Poole, is recommended as a good work on the subject.

I want through "Concentrates" some information on sampling mills, and if you could give it to me, as you have been doing through your paper, I would be greatly obliged. I wish to have an estimate on the cost of a sampling mill of from twenty-five to fifty tons a day. It is for a copper district (some gold and silver) that is fifty or sixty miles from a railroad, and the small mines

and prospects have at the present time such a limited output that they must all work through a common sampler in order to make carload shipments and get money to keep up the work. It is thought a small sampling works would make this possible. Give me an estimate of cost and the necessary crushing and sampling machinery. Also please state the proportion of a lot of ore that is taken to run the average sample down. State the proportion for sampling lots of ore of from one to twenty-five tons. I know in some lots they take about one-tenth to run through the sampler, taking every tenth shovel or wheelbarrow full. What are the usual charges for sampling? What is the profit of the sampler when they buy the ore and ship to the smelters.

Mercur, Utah.

To make a "Concentrate" in answer to such a question or series of questions would be impossible. As to the estimate of cost, if our enquirer will write to reputable manufacturers of or dealers in mining machinery, such as advertise herein, he can get correct reply. From the statement he makes, such an enterprise should prove of profit. The proportion of ore taken from a lot for sample varies with the nature of the material being sampled. There are ores of such uniformity in physical characteristics and value that a portion from one part of the lot will fairly sample the whole. There are others which require intimate mixture and portions taken frequently in order to sample satisfactorily. A common practise, in sampling by hand, is to take one shovelful in five. Automatic samplers are adjustable and would be regulated to suit the ore.

Please furnish me with, or place me in the way of securing, information and data in regard to the present and prospective use of water power in the various countries of the world.

Seattle, Wash.

This is one of the questions occasionally received that does not admit of answer. Life is too short.

Concerning an electrolytic process, where it is wished to produce pure copper directly from siliceous ore, fuel being cheap and labor reasonable, and where the ore does not carry any lime, the copper being in the ore as malachite with some little glance, can you give me the name of some practical authority thereon?

Albuqueque, New Mexico.

Mr. Alfred von der Ropp, superintendent Selby Smelting & Lead Works, Selby, Cal., is good practical authority. Edward Peters, Dorchester, Mass., is also recommended thereon.

What possibility is there to handle bismuth? Is there a market for same?

Llano Station, Sonora, Mexico.

The third "Concentrate," second column, page 63, issue of the 20th ult., answers these questions.

What is molybdenum and molybdenite, or ore of molybdenum, of which a discovery is believed to have been made in this county? In what character of rock and what combinations is it found? What is the appearance of the ore and of the metal? What are its principal uses? What is its commercial value, where worked and marketed?

Bishop, Inyo Co., Cal.

Molybdenite is not uncommon; it has been found in California allied with various other ores and in the same rock in which they are ordinarily found: In El Dorado county, at Cosumnes, with copper ores; at Fresno Flat, Fresno county, at the Beveridge mine; near Independence, and not very far from the residence of our inquirer; at the Excelsior mine, Nevada county; near Campo, San Diego county, and several other southern California localities. Molybdenite is a soft, metallic, scaly, foliated mineral of a glossy lead color. It is the sulphide of molybdenum. Molybdenite is not used on the Pacific coast. Concentrated, it is worth about $200 per ton. Molybdenum is a soft metal, easily filed and polished, malleable when hot, does not scratch glass, specific gravity 9.01. Its commercial value is as a deoxidizing agent in steel manufacture. The Bethlehem Steel Co., Bethlehem, Pa., can furnish further desired information.

Please advise me through "Concentrates" what processes are in use for winning the silver from silver-lead base bullion.

Chicago, Ill.

The extent of the subject precludes possibility of compression. Read some standard up-to-date work on the subject, and communicate with men prominently engaged in the work.

There has been quite a controversy among our millmen in this part of the country as to the best drop for a 10-stamp battery, and have agreed to leave it to the MINING AND SCIENTIFIC PRESS for decision — ten stamps working on one shaft. Please give us your opinion through the PRESS.

Lundy, Cal.

It is a question that however answered will not receive general acquiescence. Probably no standard order of drop can be given. In a 5-stamp battery, for instance, some millmen say 1, 3, 5, 2, 4 is a good order of drop; others insist that 1, 5, 2, 4, 3 is better. The argument of the latter is that that makes uniform the splash of water and pulp in the mortar. Thus, No. 1 dropping, sends the water through the battery lengthwise, which No. 5, in falling, catches and throws back; the same with No. 2, sending it back to No. 4 in its descent, No. 3 equalizing the swash. The same principle of practical work is believed to make good the order of 1, 6, 3, 8, 5, 10, 2, 7, 4, 9, in answer to our Lundy correspondent.

Can I locate and mine a river bed embraced in an agricultural claim? The river is rich in placer; on either side the land is barren, but is filed on as agricultural. Can I work the river bed in spite of agricultural claims?

Kingsburg, Fresno Co., Cal.

Only public mineral lands are subject to entry under the mining laws. Any tract to which a private claim has legally attached does not come under the head of public land. Hence, off-hand, the answer would be: "No, you can not." But it were well to look into the legality of the "agricultural claim." Has the agricultural claimant a right to his claim? A river bed is not ordinarily the subject of a legal private claim of any kind. Submit the exact specific facts to a good mining lawyer.

A question comes up which it has been agreed to leave to you for decision. We have a six-mile pipe line—8-inch pipe, head 130 feet, flowing or carrying regularly about 12 cubic feet of water per minute. If 20,000 gallons of water were added at once, or nearly so, to the regular supply at the head, how soon would the increase of discharge at the lower end be noticed?

Pinos Altos, N. M.

In answering this question we have not gone into close figures and are not taking fractions or decimal points into consideration, but simply give an idea of data pertaining to this problem: Eight-inch pipe carrying 12 cubic feet per minute will carry .2 of a cubic foot per second. With riveted pipe with ordinary bends, the velocity will be approximately 1 foot per second. Six miles of pipe would contain 31,680 feet and discharging the above quantity will have 5 feet friction loss per mile. To absorb 130 feet head in friction loss and get the maximum capacity, we can stand 21.6 feet loss per mile. The maximum velocity with this length, size and head of pipe is 2.65 per second, but owing to the pipe figured on being riveted and not new, there would not, in this case, be over 2.3 feet velocity, to absorb the amount mentioned in friction. This would show a discharge of 29.4 cubic feet per minute, minus the 12 feet which is the main supply, and will allow 17.4 cubic feet per minute of the 20,000 gallons additional to be discharged. At 2.3 feet velocity per second, it will require 13,774 seconds for the water to be discharged after being admitted to the upper end of the pipe. This will be 3.826 hours from the time the first additional water is admitted into the orifice at the upper end of the pipe before it is discharged, and the entire 20,000 gallons will enter the upper end in 150 minutes. As the line will contain 82,722 gallons, including the 12 cubic feet per minute, the water will be admitted in two and one-half hours. The first discharge will be perceptible in 3.826 hours and the normal flow of 12 cubic feet per minute will commence two and one-half hours later.

The intent in answering such questions in such a way is to give approximately correct information or tell where it can be had; that is, to aid the inquirer so far as possible in his manifest intent to find out further regarding the subject of his inquiry. No answer is absolute or final, and if in the multitude of questions so answered is found even further fragmentary knowledge, the sincere desire of the paper to be useful in the mining and scientific world is satisfied.

Fineness of California Gold.

TO THE EDITOR:—In your issue of January 20th appeared, under the caption of "Fineness and Value of California Gold," a table compiled by the superintendent of the Mint at San Francisco, giving the average fineness of gold produced in various counties of the State.

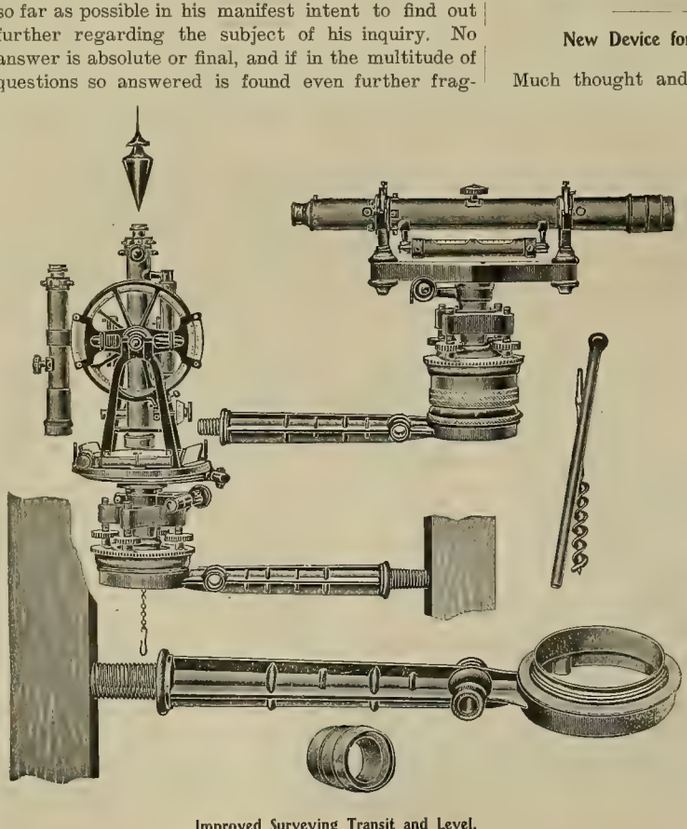
The table appears to me to be based on insufficient data, if compiled from records of deposits which only cover a period of several months.

To make such a table entirely reliable, it should be compiled from data extending over many years and embracing values reaching into millions of dollars. When made under such conditions it will be found that the average fineness of gold varies but little in the different counties, while single localities or individual mines, often close together, present great variations, chiefly traceable to the physical and genetic conditions of the various deposits.

I subjoin the following table of the fineness of the gold from various points in central and southern Plumas county, from data collected during a period of forty-five years, and based upon bullion values exceeding $3,000,000.

For most of this information I am indebted to the courtesy of Messrs. Thompson & Kellogg of Spanish Ranch, whose records of purchase and shipment of gold dust and bullion extend from 1860 to the present day:

No. Localities.	Class of mine.	Fineness, thousands.
1—Fale's Hill	Hydraulic	970
2—Corneliusais Gulch	Placer	968
3—Mountain House	Placer	960
4—Diadem Mine	Quartz	959
5—Badger Hill	Hydraulic	948
6—Eagle Gulch	Placer	943
7—Bean Hill	Hydraulic	940
8—Gopher Hill	Hydraulic	938
9—Blackhawk Creek	Placer	905
10—Emigrant Hill	Drift	904
11—Butterfly Valley	Placer	902
12—Grub Flat	Placer	900
13—Smith's Hill	Hydraulic	900
14—Green Flat	Placer	890
15—Rich Bar	Placer	886
16—Mill Creek	Placer	885
17—Twelve Mile Bar	Placer	885
18—Shenandoah	Quartz	882
19—Long Bar	Placer	880
20—Rich Gulch	Placer	850
21—Soda Bar	Placer	848
22—Rush Creek	Placer	845
	Average	908



If the product of the quartz mines in the northern and eastern sections of the county were included in the list, the result would probably be somewhat lower.

J. A. EDMAN.

Meadow Valley, Feb. 10.

New Device for the Surveying Engineer.

Much thought and study have been given to the perfection of instruments of precision used by engineers and surveyors, and progress continues to be made in the design of surveying instruments. Herewith is illustrated a short focus lens attachment, which enables the observer to focus objects by the main telescope of the instrument within a distance of 3 or 4 feet, being to the transit or level what the spectacles are to the human eye. One of the devices is shown separate and one is attached to the level in the accompanying cut. It is made by a Boston, Mass., manufacturer. The instrument bracket, by which the transit or level can be set up in cramped places, such as in the shafts of a mine or in tunnels, when even the extension tripod can not be used to advantage, is a serviceable addition to the outfit of a mining engineer. The transit can be centered from above or below a given point. An auger and lever are furnished, wherewith the bracket can be screwed to the timber of a mine.

Improved Surveying Transit and Level.

IT is claimed that the dust of the De Lamar, Nevada, mill is responsible for the death of fifty men.

A Door Closed to Miners.

To the Editor:—The case of Blackburn vs. Portland Gold Mining Co., recently decided by the Supreme Court of the United States, possesses more than ordinary interest, in that it relegates to the State courts a line of litigation which has recently been accepted by the lower Federal courts as within their jurisdiction, and which the State courts will not entertain without some qualifications.

It appears in that case that the plaintiff alleged the right to the possession of and patent for a part of a lode claim for which the defendant had applied for a patent. Both complainant and defendant were citizens of the State of Colorado, and the suit was brought in the United States Circuit Court of that State upon the theory that the court had jurisdiction of the case as one necessarily presenting a federal question. The case was dismissed for want of jurisdiction, and the complainant carried the case up on writ of error.

The defendant moved to dismiss the case in the Supreme Court on the grounds: "that the court had no jurisdiction, either of the parties or the subject matter of said suit; that both the plaintiff and defendant in said suit are citizens of the State of Colorado, and the same is not one wholly between citizens of different States; that it appears from the complaint that said suit is one which cannot under the Constitution and statutes of the United States be brought into the Federal Court."

The Supreme Court affirmed the judgment of the Circuit Court, Justice McKenna dissenting.

In the course of the Supreme Court's opinion it is said: "Without undertaking to say that no cases can arise under this legislation (Secs. 2325-2326 U. S. Rev. Stats.) which turn upon a disputed construction, and therefore presenting a question as essentially federal in its nature, we hold that clearly where a patent is authorized to be issued to the party in possession, the statutes refer the contest to the ordinary tribunals, which are to determine the rights of the parties without any controversy as to the construction of those Acts, but are to be guided by the laws, regulations and customs of the mining district in which the lands are situated. (But what is to become of a case involving a mining claim situated in no existing mining district? And there are many such.) In a case, therefore, like the present, where federal jurisdiction does not arise because the parties are citizens of different States, and where no question is made as to the meaning and construction of the statutes of the United States, the State courts are to be regarded within the letter and meaning of Section 2326, as courts of 'competent jurisdiction to determine the right of possession.'"

This distinctly overrules the case of Shoshone Mining Company vs. Rutter (87 Fed. Rep. 801) and the later case of McFadden vs. Mountain View Mining Company, in both of which the Circuit Court of Appeals for this circuit held that such a suit arose under the laws of the United States, and was within the jurisdiction of the Circuit Court and under the authority of which adverse claim suits, so called, as well as suits arising under other sections of the mining Acts of Congress, have lately been brought and maintained in this circuit, notwithstanding the fact that there was no diverse citizenship shown as ground for federal jurisdiction, or that any right, privilege or immunity under the Constitution or laws of the United States were specially set up or claimed or that any such right was denied them or that the necessary effect in law of the judgment would be the denial of any right claimed under the laws of the United States.

Under the rule laid down in Blackburn vs. Portland Mining Co. the great mass of mining litigation must now be instituted and maintained in the State courts with but little chance for review by the United States Supreme Court. A proposition which is emphasized in Mining Co. vs. Turck (150 U. S. 138).

While the import of the decision in the Blackburn case is to practically close the door of the Federal courts to the miner in cases involving title to mining claims and trespass thereon, the State courts are none too eager to entertain this litigation, for in Altoona Co. vs. Integral Co. (114 Cal. 100) our Supreme Court has held that the jurisdiction of the State court over an action to quiet title to a mining claim, although brought by a person claiming adversely to the applicant for patent in conformity to the mining Act of Congress, is not based upon Section 2326, Rev. Stats.; that the jurisdiction and procedure governing such action depend entirely upon the Constitution and laws of the State, and it is immaterial whether the judgment therein can be made available in the land office or not. Consequently, it is not essential that such action should be commenced within thirty days from the time the claim was filed in the Land Office as required by said section. This view was also taken by that court in Quigley vs. Gillett (101 Cal. 462) and is approved by other courts of last resort in some of the other mining States.

This is in consonance with the doctrine that Congress cannot vest any portion of the judicial power of the United States, except in courts ordained and established by itself. Hence, Congress cannot force the courts of a State to entertain jurisdiction in any case and our Supreme Court has certainly shown its disinclination to accept jurisdiction of a case merely because it is such a one as Congress has provided may be commenced in a court of competent jurisdiction.

But the mining Acts of Congress properly do not attempt to confer any jurisdiction by expression upon the State courts not already possessed by them, although the Supreme Court of Nevada has held in 420 Mining Co. vs. Bullion Mining Co (9 Nev. 248) that the object of the law was to require parties protesting against the issuance of patent to go into the State courts and there have the controversy determined.

Under the law as now interpreted by the courts the rights of the miner are anomalous, as in a great majority of such cases these rights must be determined by the laws of the United States in some court not created by the same power that enacted such statutes and there, says the Supreme Court of Nevada in 420 Mining Co. vs. Bullion Mining Co., supra, "be tried by the same rules, governed by the same principles, and controlled by the same statutes that apply to such actions in our State courts, irrespective of the Acts of Congress," until Congress affords relief by proper legislative action.

San Francisco, Feb. 21. A. H. Ricketts.

Some Notes on Gold Dredging.

To the Editor:—The articles in the late issues of your paper by Mr. Theo. F. Von Wagenen on dredging for gold are good, and in my opinion are the ablest statements of downright facts that have been recently written on the subject. It is true, unfortunately for all concerned, that men who have the management of dredging plants are often without practical knowledge of mining or of the mechanical work required to build and operate a mining dredger.

On Snake river it has been the practise for such inexperienced men to pick up some miner who claimed to have made a success on a small scale and adopt his method, not knowing that there are many ways of saving gold in a small way that will not work wholesale, or that the miner probably did not save all the gold with his small machine. After such systems have failed on a large scale, they have been torn out and other similar ones put in at large expense. This operation has been repeated until at last the company represented has refused to put up more money. Then debts have been incurred, for which the property has been attached, and finally sold for just enough to satisfy the creditors.

This programme has been repeated so many times that it has given Snake river a bad reputation in that regard. But in nearly every instance of failure there have been men who have already tried the systems about to be used, or seen them tried, who were generous with their dearly bought knowledge, but the new men placed more confidence in their own judgement and sometimes said that one man might make a method work with which another had failed, and so went to their rope's end. Men have always risen on the stepping stones of the experience of others, but in Snake river mining they have preferred to hew their own steps as they went along until their knives dropped from their hands and they were helpless.

I have had practical experience in trying to save fine or flour gold and have kept informed in regard to the different systems used, and these are a few general conclusions that I have reached:

First.—There is money to be made on Snake river, if the proper appliances are used: but I believe that only the uncovered bars should, as a rule, be worked. The average value is not high enough to warrant the expense of removing large amounts of dead material. But this covering may be gradually removed by the action of the river, if care is taken to turn the current at high water through some shallow channel running through the strata over gravel bars. Thorough prospecting would determine where such labor should be done and no labor would be thrown away. It would take time; but in the meantime uncovered bars could be worked.

Second.—The bucket dredger does not seem to meet all requirements. There are always snags, willow roots, submerged clumps of heavy grass sod, large stones or layers of clay that strain the dredger and bend or tear off the buckets. Besides, the values are partially concentrated in the bottom of the buckets by their motion and are carried over and lost. This is the case particularly where there is clay in the formation. I would use, instead, a scoop dredger of large capacity and very strongly built. The delays caused by repairing breakages have been hitherto one of the principal causes of failure.

Third.—No dredger should be built without a strong, thoroughgoing stacker for carrying away the tailings.

Fourth.—A continuous system of concentration and amalgamation should be used, involving no delays for any purpose. The gravel should pour in like a stream and be carried on steadily over the machinery used, until stacked securely on a dump out of the way of future operations.

Fifth.—That system is the best, all other things being equal, which requires the fewest men, as it is imperative that the operating expenses should be kept down to the lowest possible figure.

Sixth.—The manager should be a man who, at least, can tell the value of the material accurately, and, what is of greater importance, the amount of gold left in the tailings. For, whatever system is used, the tailings should be constantly tested, as a leak here is very disastrous, when the values are small in the material worked.

Seventh.—There are many fairy tales told of the values on Snake river. I have prospected over a large part of it, and have come to the conclusion that 8 cents per cubic yard is a fair average. The values are not uniformly distributed, running from $1 in places all the way down to nothing, or nearly nothing. Occasionally, a small spot is found that runs several dollars per yard; and, while such streaks help to raise the average value, they often deceive the prospector, as well as the promoter, as to the general character of the ground. Three cents per yard is a close estimate of the cost of working the material, if large quantities are worked without wasteful delays. A dredger that actually handles 1000 yards in ten hours and saves the gold must make a good profit on the money invested; but, to my knowledge, no dredger on Snake river has done this up to the present time.

Eighth—Amalgamating plates do not save all of the gold, and are wasteful in quicksilver. Amalgamation is prevented by the slimes in the material and by the coating of much of the gold.

In conclusion, will say that I know of only one system that saves practically all of the values with a degree of economy that makes it profitable to work low-grade ground with profit, and when that becomes better known and generally adopted, dredging for gold will become an established and most profitable business. Miner.

Mills Loaded With Orders.

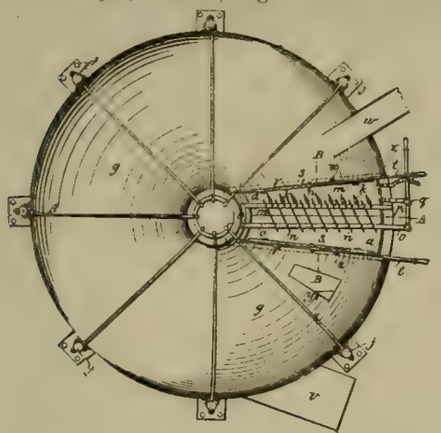
It is useless to try to say what to-morrow may bring forth. The iron and steel mills are everywhere completely loaded up and loaded down with business and hundreds of customers are shaking their fists with orders in them at the manufacturers. Considerably more business is being offered than is accepted. The fundamental point now is, Will prices advance to a still higher level? The ore consumers, that is to say the furnace interests, have made any serious advance practically impossible by contracting for their ore at fixed prices, as above mentioned. Pig iron need not cost much more next year than now. This assurance is the basis for the present confidence in next year's prices, but manufacturers are not willing to go much further into the fog than they now are. There is a heavy demand for plate and structural material, and urgent buyers are known to have paid as much as $10 to $12 a ton above the asking price.—Implement Age.

In the Days of '49.

Writing from Rocky Bar, Idaho, renewing his subscription, Mr. John P. Martin says that he first began his regular annual subscription to the Mining and Scientific Press when he and his fellow miners were pioneer hydraulic miners. He says: "I think we opened the first hydraulic mine. The first hydraulic hose was also used in our diggings on Manzanita hill, near North San Juan, Nevada county, Cal. We sent to New York and got several hundred feet of fire-hose from the city hall. I had been a member of No. 29 Hose Company, New York City, and was well acquainted with the hose used by the fire department of that city. My partner, Mr. Kilby, had been a member of the fire department in Williamsburg; so it was a small matter to get the hose. In those days all such material had to come around the Horn and I think it was 199 days getting around, but it got to North San Juan finally."

The seventy-eighth meeting of the American Institute of Mining Engineers is in session in Washington, D. C., this week. Director C. D. Walcott of the United States Geological Survey read a paper on "The Work of the United States Geological Survey in Relation to the Mineral Resources and Mining Industries of the United States."

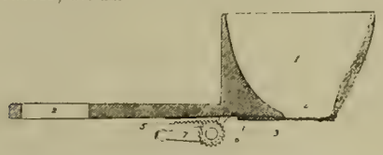
The United States steamer Nero, during its recent survey for a transpacific cable, in its deep sea soundings, made one sounding near Guam island marked 5160 fathoms and another 5269 fathoms, only 66 feet short of six statute miles. This is deeper than the highest mountain peak on the land surface of the globe.



Wherever or whenever the price of gas or fuel suitable for such use ceases to be prohibitive the gas engine comes into equal domain with steam, electricity and compressed air. In New York City illuminating gas suitable for use in a gas engine is now securable at 50 cents per 1000 cubic feet.

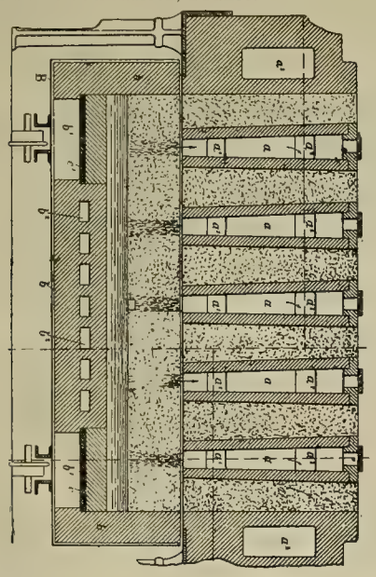
Latest Mining and Metallurgical Patents.

Patents Issued Feb. 13, 1900.



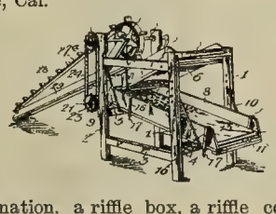
Specially Reported for the MINING AND SCIENTIFIC PRESS.

PROCESS OF CALCINING.—No. 642,602; J. Godfrey and H. J. Hayes, Swansea, England.



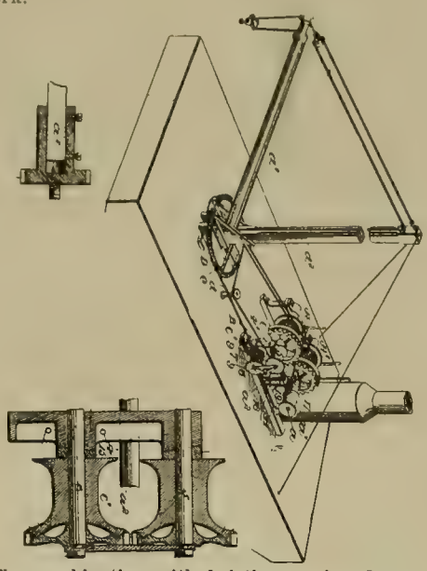
A process of calcining consisting in alternately heating material to be calcined in a closed furnace and exposing it while being stirred to oxidizing effects of atomsphere in open air, out of contact with products of combustion.

FLUX FEEDING DEVICE.—No. 642,931; C. W. Sleeper, Lancaster, N. H.



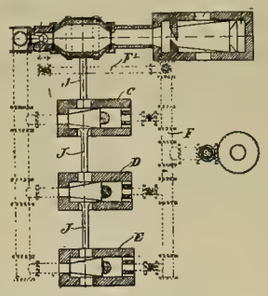
The combination in a flux feeding device, of box to hold flux, of slide arranged to rest upon the bottom of box and pass freely through a slot in side of box, and means for imparting reciprocating motion to slide; the side of the box being serrated with deep recesses to allow flux to fall in front of slide while slide is held down by points between serrations.

ELECTRIC FURNACE.—No. 643,254; A. J. Petersson, Notre Dame de Briancon, France.



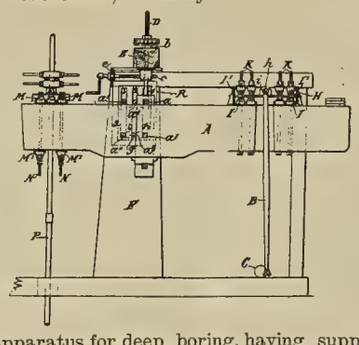
In an electric oven, two superposed chambers of which lowermost is movable and uppermost fixed, fixed chamber adapted to receive and feed material to be reduced and movable chamber having a hearth adapted to receive reduced material, in combination with two electrodes of relatively large area and arranged in a horizontal position in hearth, upper surfaces of electrodes being level with hearth.

GOLD WASHING MACHINE.—No. 643,233; F. C. Pinnell, Lodge, Cal.



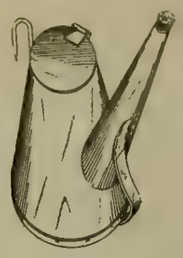
In combination, a riffle box, a riffle consisting of plate, transverse strips secured thereto, metal cap secured to each strip and projecting beyond sides forming pockets, longitudinal rails provided on top of strips, screen having a series of concavities with perforations formed therein, U-shaped clamps each having a cam lever journaled in one end thereof, clamps being arranged to have cam levers operate against bottom of box drawing opposite ends downward to clamp screen and riffle plate.

HOISTING MACHINE.—No. 643,516; S. Mattson, New York.



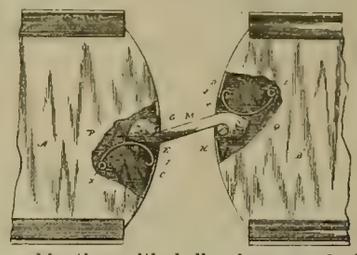
The combination with hoisting engine, drum and shaft therefor, and a gear pinion on shaft, of supplemental frame having non-rotary shafts projecting, paralleling first mentioned shaft, gear wheels loose on non-rotary shafts, meshing with gear pinion, drums loose on non-rotary shafts capable of frictional contact with gear wheels, cams on non-rotary shafts for binding drums against gear wheels, and connections between cams.

PROCESS OF SMELTING AURIFEROUS ANTIMONY ORES.—No. 643,301; C. C. Longridge, Leigh, and G. T. Holloway, London, England.



A process for extraction of gold from auriferous antimony sulphide ores consisting in fusion of metallic antimony with ore and addition of sufficient metallic iron to fused ore to convert enough antimony sulphide to metallic antimony to make good the loss of metallic antimony due to the solvent action of the sulphide ore and in the intimate admixture of metallic antimony and sulphide of antimony by mechanical means, to effect extraction of gold by virtue of greater affinity of metallic antimony than antimony sulphide for gold and by greater density of antimony gold alloy produced.

APPARATUS FOR DEEP BORING.—No. 643,428; J. Vogt, Niederbruck, Germany.

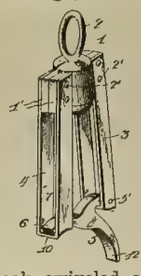


An apparatus for deep boring, having supporting frame with horizontal grooves, rocking beam supported in frame, boring rod suspended from one arm of beam to receive boring tool, and operating means coupled to opposite end of beam, two trunnions for beam, movable along same in horizontal grooves in frame, and a screw for shifting trunnions along frame, whereby the fulcrum of beam is adapted to be shifted without moving beam either longitudinally or vertically.

PIT OR MINING LAMP.—No. 643,281; R. C. West, Rostraver, Pa.

A miner's lamp provided with a protector which consists of a strip of spring metal secured to bottom of lamp passed around the rim at front thereof and secured to lower portion of spout.

CAR COUPLING FOR MINES.—No. 643,504; H. Hughes, Brazil, Ind.



The combination with hollow bumper of mine car provided with curved outer end having a central opening therein at extreme outer part of curve, of fixed coupling pin inside bumper and close to one side of opening, a semi-circular curved spring secured its inner end inside bumper, main curved body of spring projecting across opening, and backwardly curved outer end resting at edge of opening opposite fixed pin, a link consisting of main body, oppositely turned hooks to engage pins, and wedge-shaped cam ends, with sides curved on curvature of spring.

MINE TROLLEY HANGER.—No. 643,327; G. E. Jamme, Pittsburg, Pa.

The herein described trolley hanger for mines, comprising, in combination, a tube having split upper end, a tapered plug expanding tube and securing it in place, a shell attached to lower end of tube, an insulating material secured in shell, and a means embedded in insulating material for attaching thereto the clip which suspends trolley wire.

LOCKING HOOK FOR MINERS' BUCKETS.—No. 643,534; L. J. Richmond, Carthage, Mo.

In safety bail hook, swiveled socket formed with diverging arms, a latch fulcrumed in one arm and having free end adapted to engage opposite arm to lock it with reference to latch arm.

If steel be cooled gradually from the solidification point, it will be noticed that the fall of temperature is at first regular; at a certain point the cooling ceases, and the metal for a time either remains at a constant heat or even shows an increase in temperature; below this point the metal cools regularly as before. This point where cooling is interrupted marks the temperature at which steel changes from the amorphous and plastic condition, in which it can be forged and welded, into the crystalline structure which it retains when cold. It marks the temperature at which the best results can be produced by quenching, and it marks, also, the temperature to be attained (and very slightly exceeded) in annealing.

Masonry Dams and Retaining Walls.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by GEORGE T. PARDOE.

The author cannot lay claim to being the first to propose the method, but he thinks he can explain the method to mining engineers with advantage, he having noticed that most mining journals in describing works are rather apt to take the scientific knowledge of the designer, and also their readers, for granted, and do not, therefore, give any clue as to the principles adopted in the design.

The system consists in dividing the entire height of the dam into a suitable number of sections (by supposititious horizontal joints), and calculating the weights and properties of each section first separately and then in conjunction with those above it, starting from the top and assuming a thickness of joint in the first instance.

Should calculation show that the center of resistance falls outside the "middle third" at any joint a slice is added to the outer face, and if the required slice is large a new calculation is desirable. The same process is followed if the line of resistance when the reservoir is empty, or, in other words, the line of the center of gravity is too near the inner face. In that case a slice is added to the inner surface.

We will assume that the dam is to be divided vertically into ten sections, each being therefore 5 feet high.

NOTE.—The number of sections here given are fairly large. In actual practise it is desirable to divide the height into a few sections, say four, and calculate the profile approximately, and making a drawing of such profile roughly and to scale it will then be easier to calculate the profile with a large number of sections. The principal advantage of a large number of sections is that it gives a profile approximating more closely to a curve.

Taking the top width at 9 feet, a preliminary calculation shows that the upper two sections may be a rectangular block and still be within the limits of stability.

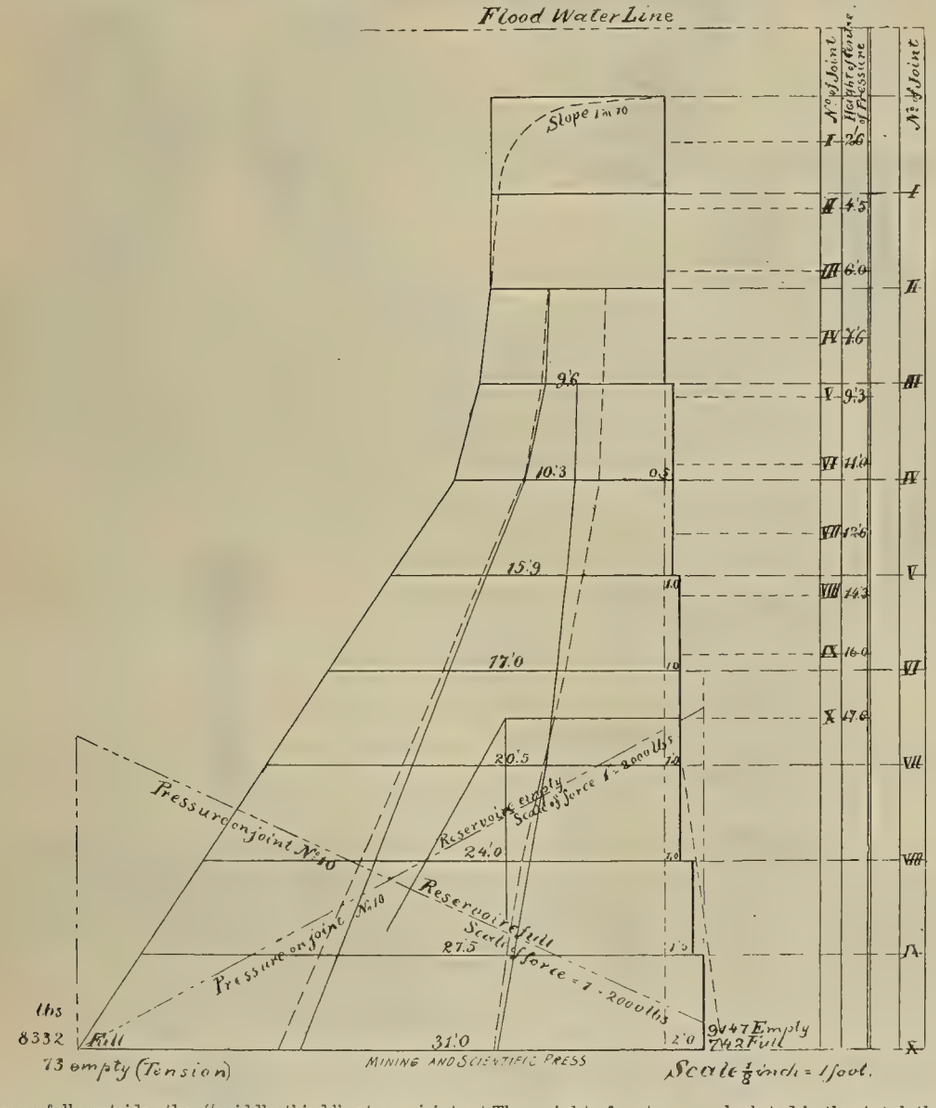
SECTIONS I AND II.

Weight of masonry = $9 \times 10 \times 165 = 14850$ lbs.

Total water thrust = $62.5 \times 8 \times 10 = 5000$ lbs.

Tangent of angle of deviation of resultant from vertical = $\frac{5000}{14850} = 0.336$.

Weight of center of pressure = $\frac{13}{3} = 4.3$ feet.



Deviation on joint II from C. of G. = $4.3 \times 0.336 = 1.4$ feet.

Distance of C. of Res. from inner face = $4.5 + 1.4 = 5.9$ feet.

Distance from inner face of outer limit of middle third = $4.5 + \frac{9}{6} = 6$ feet.

NOTE.—As to water thrust. A simple method of calculating this is as follows:

Imagine that the face of the wall can be turned on an axis parallel to its breadth and coinciding with the C. of G. of the plane exposed to the water pressure in this case = half the height of the wall, not half the depth of the water. Turn the face about its axis and calculate the weight of water contained in a box of the same shape of bottom as the plane of the face of the wall and of a height = the depth of water from the surface to the axis round which the face has been turned and of a length = to the height of the wall.

The weight of water so calculated is the total thrust on the wall.

SECTION III.

Height of C. of P. = $\frac{18}{3} = 6$ feet.

Total water thrust = $62.5 \times 10.5 \times 15 = 9843$ lbs.

Top thickness = 9 feet; bottom thickness = 9.5 feet.

Distance of center of G. from inner face = $\frac{1}{3}\left(9 + 9.5 - \frac{9 \times 9.5}{9 + 9.5}\right) = 4.5$ (nearly).

Total weight of I, II and III sections = 33618 lbs.

Tangent of angle of resultant = $\frac{9843}{33618} = 0.292$.

Deviation of resultant from C. of G. = $6.0 \times 0.292 = 1.7$ feet.

Distance of C. of Res. from inner face = $1.7 + 4.5 = 6.2$ feet.

Distance of outer limit of middle third = $\frac{9.5}{6} + 4.7 = 6.2$ feet.

SECTION IV.

Height of C. of $P_1 = \frac{23}{3} = 7.6$ feet.

Water thrust = $62.5 \times 11.5 \times 20 = 14375$.

A preliminary calculation shows that in this solution, if the inner face is vertical and in line with that above it, it will be necessary to considerably increase the batter, and having regard to the large increase in the volume of masonry that this would involve in the sections below it is undesirable to allow the batter to increase too rapidly. We will therefore increase the batter to 1 foot in 5 feet and add a rectangular strip to the inside face, this being a step towards the inside of 6 inches and carrying the C. of G. that much towards the inner face.

We have therefore the following values:

Top thickness 10 feet; bottom thickness 11 feet.

C. of G. from inside face = $\frac{1}{3}\left(10 + 11 - \frac{10 \times 11}{10 + 11}\right) =$ 5.3 feet.

C. of G. from inside face of sections above = $5.3 - 0.5 = 4.8$ feet.

Weight of section IV = 8662 lbs.; total weight = 42280 lbs.

Tangent of angle of resultant = $\frac{14375}{42280} = 0.339$.

Deviation of C. of Res. on joint = $0.339 \times 7.6 = 2.5$ feet.

Distance between centers of G. = $4.8 - 4.5 = 0.3$ feet.

Distance of common C. of G. from inside face = $5.3 - \left(\frac{33618}{42280} \times 0.3\right) = 5.1$ feet.

Distance of center of Res. from inside face = $5.1 + 2.5 = 7.6$ feet.

Outer limit of middle third = $5.5 + \frac{11}{6} = 7.3$ feet.

Inner limit of middle third = $5.5 - \frac{11}{6} = 3.7$ feet.

This calculation shows that the line of resistance falls slightly outside the middle third, but as the error is only slight it may be corrected by adding a wedge-shaped slice to the outer face, making the base of No. IV section 11.3 feet instead of 11 feet wide.

NOTE.—Common C. of G. It is obvious that having calculated the horizontal position of the C. of G. of any one section the center of G. common both to it and to the sections above will be at some point between the two, the distance between being divided in inverse ratio to the weights. For example: Two weights of 9 lbs. and 1 lb. weight respectively at the extremities of a weightless bar 10 feet long. The C. of G. will be 1 foot from the 9-lb. weight and 9 feet from the 1-lb. weight.

It will be seen that the new section whose C. of G. is farthest from the inside face of the dam is of less weight than the combined sections above it, and consequently the C. C. of G. is nearer the inner face than the new C. of G. by the proportionate distance along the bar represented by the distance between the centers of G.

Thus if W = the greatest weight (= sections above) and W_1 = smaller weight (= new section) the distance of whose C. of G. from the inside face = D, and the space between the two centers of G. = S, then C. C. of G. = $D - \left(\frac{W}{W + W_1} \times S\right)$

The author offers no apology for dealing with such simple matters as this, since he believes that many men (in hot countries especially) grow rusty as regards knowledge outside their immediate work, and that such busy men require to have information given in the simplest and most easily digestible form.

(TO BE CONTINUED.)

MINING SUMMARY.

ALASKA.

The Secretary of the Interior has confirmed the decision rendered by the Commissioner of the General Land Office in which it was held that the tide lands of Alaska are not public lands belonging to the United States, within the meaning of the mining laws, and that no rights whatever with respect to such lands shall be acquired by exploration, occupation, location or otherwise under the mining laws.

ARIZONA.

GILA COUNTY.

J. J. Cramer has sold one-half interest in the Ohio Boy group of copper mines, of which he has been appointed foreman and Gen. Mgr.

Chittenden & Ladd of Washington, D. C., are opening up properties near Queen creek and are crosscutting ledges on their Antilles group, near the Buttes, twelve miles from Florence.

Silver Belt: J. A. Fleming, Pres. Black Warrior Copper Co., Amalgamated, has returned from Philadelphia, where he accomplished the amalgamation of the Black Warrior and Donnellan Copper Cos., the holdings of the amalgamated company in this district numbering seventy-five claims. The trial run of the Black Warrior leaching works and furnace has demonstrated the success of the method of reduction and its adaptability to the Black Warrior ores. The entire works have been put under cover. New acid pumps have been put in, and the tanks and launders are being lined with lead. Two tanks, 20 feet in diameter at bottom, for slimes, are being added. The deficiency of water supply is to be overcome by a pumping plant at Pinal creek, two miles north of Globe, and at Russell gulch. There will be thirteen miles of 8, 6, 4 and 3 inch pipe. A 200-ton concentrator and acid works will be built. The sulphide ores for making acids will be furnished from the Diamond H mines. It is expected that the present works will be running and turning out copper within six weeks.——At the United Globe mines the work of sinking the Hoosier shaft from the eighth to the ninth level is going on. The new pump of 1,500,000 gallons capacity will not be installed until the ninth level is reached, and not then unless a greater flow of water is encountered. The Hoosier mine is looking well in all the lower levels. In the Gray mine a drift is being driven to connect with the Hoosier at the sixth level.

GRAHAM COUNTY.

Guardian: Development work is being done in the May Flower district, near Duncan. The ore appears to be in large bodies and runs in copper.

YAVAPAI COUNTY.

J. L. Fisher of Prescott is making application for patent to the smallest mining claim on record in Arizona, embracing only .737 acre.

Counsel for minority stockholders of the United Verde Copper Co. say that the company's property on Jan. 9 will be disregarded and that they will try to have sale set aside and a receiver appointed.

Supt. Haggott is running the Henrietta 10-stamp mill on ore from the Henrietta mine.

Mr. Underhill, in charge of the Big Bug onyx properties at Mayer, has returned from London and Glasgow.

Courier: The Jordan and Campbell claims near Jerome have been sold to the Verde Queen Copper Co. of Arizona, D. P. Bosworth Pres.——The Val Verde smelter, on the Agua Fria, is completed and will begin operations March 1.——Supt. Blauvelt says at the Cash mine the workings are down over 100 feet.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—The Zeila mine, at Jackson, is one of the oldest producers in the county, incorporated in 1873 and a dividend payer since 1880. It is on the east belt. The shaft is 1506 feet deep; 1350 is the lowest level from which ore has been extracted. The ore averages $3 per ton; the sulphurets run as high as 2½%; most of the value is obtained from them. They are treated at the company's chlorination works near by. The forty stamps in the mill are run by water under 150 feet pressure, the water being caught up after doing service at the Argonaut mine, which is under the same management. The hoist is run by steam. Attached to the mill is a sulphuret-saving plant with forty-two tables, run by Messrs. G. G. Gates and A. M. Hambric, who pay a royalty for the slimes. Mr. Hambric has charge of the sulphuret-saver. W. F. Detert is Gen. Mgr., B. F. Taylor chief engineer.

The Amador Queen No. 1 is the property of the Jackson Exploration & Development Co., Ltd., of London, and numbers among its stockholders many prominent English gentlemen. The Supt. is Jas. E. Dye, who took charge of the property in 1889. At present operations are limited to development work. Drifts are being driven north and south on the 1200 level, and sinking is still going on. The ore is low grade, similar to that in the Zeila. It is expected that sufficiently rich ore shoots will be encountered to warrant starting the 60-stamp mill, which has been idle for some months. Both mill and hoist are run by water. The water wheel for the hoist is 200 feet or more below the collar of the shaft, the power being transmitted therefrom by Manila rope. S. T. Smallfield is foreman at the mine; J. E. Dye, Jr., and E. C. Brown, engineers; R. Jones, assayer.

The Amador Queen No. 2 is on the opposite side of the creek from No. 1. The two claims were formerly under the same management, but are now separate properties. As at No. 1, work is at present for the purpose of development, and the 20-stamp mill is idle. A tunnel 1000 feet long has been driven into the side hill, and at intersection with the ledge a station was cut out. In a drift 760 feet from this point a shaft has been started, which will be sunk 200 feet before crosscutting. The hoist is run by water. J. R. Phillips is Supt., V. Van Hall foreman. The stockholders are mainly Toledo, O., people. About twenty men are employed.

The Peerless, with its conjoined claims—the Midway, Osborne and Excelsior—is one of the most recent locations near Jackson to receive attention at the hands of developers. These claims are supposed to be on the main lode, with the Gwin on the south, the Argonaut, Kennedy, etc., on the north. A steam hoist is in operation. The shaft has two compartments, 4x5 feet each, with 8-inch centerbrace, and is being timbered with pieces 12x12 inches, under the superintendence of Henry Osborne.

The Argonaut is the first active property north from Jackson. It adjoins the Kennedy on the south, the hoisting works of the two mines being close to the boundary line between the two properties, and the underground workings running into each other. The Argonaut shaft has three compartments and is 1700 feet deep, at an angle of 62°—the average incline of the vein. The shaft was started in the foot wall, but at 1400 feet cut across the vein, which again came into the shaft at 1700 feet. The mine has a 200 H. P. hoist, run by water, 500 feet down the hill from the shaft, power being transmitted by wire cable. A 40-stamp mill, run by water, is close by. W. F. Detert is Mgr. and principal stockholder; B. F. Taylor, also part owner, chief engineer; J. B. Francis Supt.; L. W. Borger, accountant and metallurgist; Frank Taylor foreman of the mill.

The Kennedy mine is a mile north of Jackson. Since the incorporation of the company in 1886, it has paid about $3,000,000 in dividends. It is still one of the most productive mines in the State. There are two working shafts on the property—the north and the south—600 feet apart, and these are connected at most of the levels. The dump of the south shaft is on lower ground than that of the north shaft, and cars of ore from the former are raised on a hydraulic elevator to be run into the mill on the main track. The machinery at each hoist is run by water, but there are reserve steam plants. The north shaft is 3000 feet deep, corresponding to the 2300-foot (vertical) station. A new vertical shaft is being sunk, 2000 feet east of the present workings. This shaft, 5x14 feet, three-compartment, is now down 1000 feet, and it is calculated will strike the vein at a perpendicular depth of 3500 feet, making it the deepest in the State. Although the rock in the new shaft is tough and hard to break, Supt. Geo. W. C. Glass has been making an average of nearly 90 feet per month, with the use of a single reel hoist. Four power drills are employed, air being taken from a steam compressor on the surface. It is probable a new and large mill will be erected near the new shaft. The present mill of the company is near the old shafts, contains forty stamps and is run by water. Arrangements for saving sulphurets are complete. The Kennedy employs 150 men; W. F. Parks Supt.; Sam'l Pierce mine foreman; Webster Smith mill foreman; E. H. Harrington accountant and metallurgist.

The Oneida mine adjoins the Kennedy on the north. The property includes 2900 feet of lode under mineral patent, and 280 acres of ground under agricultural patent. The Oneida was first worked in the early fifties, belonging successively to U. S. Senator Stewart and James Morgan, and to the Seligman Bros. of New York. The latter parties, in 1896, parted with a one-half interest in the property to the Exploration Co. of London, the purchasers agreeing to put the purchase price into the development of the mine. A new vertical shaft was started 1000 feet east of the croppings, and intersected the vein at a depth of 1892 feet; it is now 200 feet below that point. Sinking has been discontinued, and the work of developing the ore body has been going on for some time. The grading has been completed and contracts let for the necessary machinery for a 60-stamp mill, to be located a short distance from the new hoist. With 6000 tons of ore on the dump, and large quantities blocked out in the mine, the mill will be busy. The hoisting engine at the new shaft is the finest on the Mother Lode, and has been illustrated and described in the MINING AND SCIENTIFIC PRESS. It is a counterpart of the one supplied by the Union Iron Works for the Anaconda copper mine of Butte City, Mont. It is a double direct-acting steam hoist, 20x60 inch cylinders, flat rope reels and capable of hoisting a 7000-pound load at the rate of 2000 feet per minute. Water from the mine is hoisted in an 800-gallon tank. The hoist is provided with steam brakes and steam safety clutches; there are also safety clutches on the cages. At the old shaft, which had been extended to a depth of 1350 feet in early days, work is confined to cleaning it out and retimbering. This has now been done to a depth of 650 feet. A new compound pump will be stationed at the 600 level, whence it will throw to the surface the water brought to that point by smaller pumps from below. Good progress is being made in putting the old shaft in condition. Capt. Thos. Mein, of the Exploration Co., is Gen. Mgr. of the Oneida; John Truscott, Supt.; E. T. Blake, accountant and assayer. About forty men are employed.

The South Eureka mine joins the Oneida mine on the north. The company was organized and ground was broken for the shaft in 1891 and a complete plant put up. The shaft is down 1850 feet, with drifts at 600, 900, 1000, 1200 and 1600 feet, and now being run at the 1800 level. Fine rock is found in the 900 level, near the Central Eureka line. The ore is worked in a 20-stamp mill, now idle. Ordinarily the mill is run by electric power, but this source of energy was interrupted when the works of the Standard Electric Co. were destroyed by fire. The mill can also be run by water, but the supply is not sufficient to run both hoist and mill. The hoist can be run by steam as well as by water, but the early rains cut off the supply of wood for steam purposes. Thus the mill must remain idle until wood can be obtained. The outfit is complete, both in hoist and mill. J. F. Parks of the Kennedy is Supt. of the South Eureka, as well as one of the large stockholders; B. B. Haven, accountant and assayer; Wm. Pollard, foreman. Sixty men are employed when the mill is running.

The Central Eureka joins the South Eureka on the north, one-half mile north of Sutter Creek. Of late this property has come under the control of a company in which the Messrs. Edward and John Coleman, formerly of the Idaho mine, Grass Valley, and Lieut.-Governor J. H. Neff are prominent stockholders. In the development work undertaken since they assumed control, a fine shoot of ore has been encountered at the 1300-foot level. This shoot has remained in the shaft to the present lowest depth—1650 feet. Considerable ore from this shoot was worked with five stamps at the Zeila mill, and yielded $87 per ton. Another shoot exists which yields ore worth $8 to $10 per ton. The management feels encouraged to erect a 10 or 20 stamp mill, and Supt. J. R. Thomas is now in San Francisco making arrangements therefor. The present hoist will be replaced with heavier machinery, and the entire plant will be revised. The hoist is run by water. The new mill will probably be run by electricity. About twenty men are now employed.
